APPENDIX A

Air Quality and Greenhouse Gas Emissions Background and Modeling Data

Reseda High School Modernization

Los Angeles-South Coast County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
High School	94.69	1000sqft	20.87	94,695.00	1078
High School	37.80	1000sqft	8.33	37,796.00	430

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	33
Climate Zone	12			**Operational Year**	2026
Utility Company	Los Angeles Department of Water & Power				
CO2 Intensity (lb/MWhr)	1227.89	**CH4 Intensity (lb/MWhr)**	0.029	**N2O Intensity (lb/MWhr)**	0.006

1.3 User Entered Comments & Non-Default Data

Reseda High School Modernization - Los Angeles-South Coast County, Annual

Project Characteristics -

Land Use - Data from Reseda High School Modernization IS/MND Project Description. 108 staff/1400 students.

Construction Phase - Default schedule increased proportionally to account for 2022 start and 2026 operation.

Grading - Assumes up to 50% of the site would be graded and soil would be balanced on site.

Demolition -

Trips and VMT -

Architectural Coating -

Fleet Mix -

Area Coating -

Construction Off-road Equipment Mitigation - SC-AQ-4 requires Tier 3 minimum. Fugitive dust reflects Rule 403 & SC-AQ-4.

Area Mitigation - SC-AQ-4 requires ultra-low-VOC or zero-VOC paint. Assumes 50 g/L. Gas leaf blower illegal within 500 feet of residence in City of Los Angeles.

Energy Mitigation - SC-GHG-5 20% improvement over Title 24.

Water Mitigation - SC-GHG-4

1.3 User Entered Comments & Non-Default Data

Reseda High School Modernization - Los Angeles-South Coast County, Summer

Project Characteristics -

Land Use - Data from Reseda High School Modernization IS/MND Project Description. 108 staff/1400 students.

Construction Phase - Default schedule increased proportionally to account for 2022 start and 2026 operation.

Grading - Assumes up to 50% of the site would be graded and soil would be balanced on site.

Demolition -

Trips and VMT -

Architectural Coating -

Fleet Mix -

Area Coating -

Construction Off-road Equipment Mitigation - SC-AQ-4 requires Tier 3 minimum. Fugitive dust reflects Rule 403 & SC-AQ-4.

Area Mitigation - SC-AQ-4 requires ultra-low-VOC or zero-VOC paint. Assumes 50 g/L. Gas leaf blower illegal within 500 feet of residence in City of Los Angeles.

Energy Mitigation - SC-GHG-5 20% improvement over Title 24.

Water Mitigation - SC-GHG-4

1.3 User Entered Comments & Non-Default Data

Reseda High School Modernization - Los Angeles-South Coast County, Winter

Project Characteristics -

Land Use - Data from Reseda High School Modernization IS/MND Project Description. 108 staff/1400 students.

Construction Phase - Default schedule increased proportionally to account for 2022 start and 2026 operation.

Grading - Assumes up to 50% of the site would be graded and soil would be balanced on site.

Demolition -

Trips and VMT -

Architectural Coating -

Fleet Mix -

Area Coating -

Construction Off-road Equipment Mitigation - SC-AQ-4 requires Tier 3 minimum. Fugitive dust reflects Rule 403 & SC-AQ-4.

Area Mitigation - SC-AQ-4 requires ultra-low-VOC or zero-VOC paint. Assumes 50 g/L. Gas leaf blower illegal within 500 feet of residence in City of Los Angeles.

Energy Mitigation - SC-GHG-5 20% improvement over Title 24.

Water Mitigation - SC-GHG-4

Re: Reseda High School, 18230 Kittridge Street, Reseda, California

Dear Mr. Smith,

EXECUTIVE SUMMARY

This tree report was prepared in conjunction with the City of Los Angeles Tree Preservation Ordinance No. 177.404 and the Los Angeles Unified School District guidelines. According to the Ordinance, "protected" trees are coast live oak, western Sycamore, Southern California black walnut, or California bay laurel with trunk diameters (measured at 4.5 feet above grade) of 4 inches or greater. "Significant" trees are any tree with a trunk diameter of 8 inches or larger. A total of 132 trees were inventoried on the subject property. Of the 132 trees, four are considered "protected" and the remaining 128 are considered "significant" trees. City of Los Angeles rights-of-way trees were not inventoried and therefore not included in this report. There are no off-site trees on contiguous properties that are affected by the construction of the proposed project.

BACKGROUND AND ASSIGNMENT

The Los Angeles Unified School District (LAUSD) is proposing a school modernization project. The 132 inventoried trees are located throughout the property. We were retained to visit the property and inventory and photograph all "protected" and "significant" trees. A comprehensive analysis of each tree as it pertains to construction was not requested and is not a part of this study. This report is based on our site visit of February 20, 2018.

Santa Monica Office
828 Fifth Street, Suite 3
Santa Monica, California 90403
Office: 310.451.4804

Sierra Madre Office

Sierra Madre, California 91024
Office: 626.428.5072

www.cycarlberg.com

OBSERVATIONS

We inventoried 132 trees of various species. Tree trunks were recorded in the field, from grade, using Surveying & Drafting Services, Inc.'s Topographic Survey (August 16, 2017). The on-site trees were numbered and tagged with an embossed aluminum tag.

Table 1 summarizes the inventoried trees and their protected status. Captioned photographs and exhibits at the end of this report illustrate site context, tree locations, tree structure, and vigor. A full-sized copy of the 'Tree Location Exhibit' is included in back pockets at the end of this report.

CONCLUSION

Once the design is finalized, LAUSD may request an analysis of construction impacts to each tree and recommendations for protection of trees during the construction process. We are available to provide a proposal for this study as requested; this assignment was only for a site analysis.

Very truly yours,

Cy Carlberg, Registered Consulting Arborist
Principal, Carlberg Associates

HEALTH AND STRUCTURE GRADE DEFINITIONS

Health and structure ratings of the trees are based on the archetype tree of the same species through a subjective evaluation of its physiological health, aesthetic quality, and structural integrity.

Overall physiological condition (health) and structural condition were rated A-F:

Health

a. Outstanding – Exceptional trees of good growth form and vigor for their age class; exhibiting very good to excellent health as evidenced by normal to exceptional shoot growth during current season, good bud development and leaf color, lack of leaf, twig or branch dieback throughout the crown, and the absence of decay, bleeding, or cankers. Common leaf and/or twig pests may be noted at very minor levels.
b. Above average – Good to very good trees that exhibit minor necrotic or physiological symptoms of stress and/or disease; shoot growth is less than reasonably expected, leaf color is less than optimal in some areas, the crown may be thinning, minor levels of leaf, twig, and branch dieback may be present, and minor areas of decay, bleeding, or cankers may be manifesting. Minor amounts of epicormic growth may be present. Minor amounts of fire damage or mechanical damage may be present. Still healthy, but with moderately diminished vigor and vitality. No significant decline noted.
c. Average – Average, moderately good trees whose growth habit and physiological or fire-induced symptoms indicate an equal chance to either decline or continue with good health into the near future. Most of these trees exhibit moderate to significant small deadwood in outer crown areas, decreased shoot growth and diminished leaf color and mass. Some stem and branch dieback is usually present and epicormic growth may be moderate to extensive. Cavities, pockets of decay, relatively significant fire damage, bark exfoliation, or cracks may be present. Moderate to significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it is expected to negatively impact the lifespan of the tree. Tree may be in early decline.
d. Below Average/Poor - trees whose growth habit and physiological or fire-induced symptoms indicate significant, irreversible decline. Most of these trees exhibit significant dieback of wood in the crown, possibly accompanied by significant epicormic sprouting. Shoot growth and leaf color and mass is either significantly diminished or nonexistent throughout the crown. Cavities, pockets of decay, significant fire damage, bark exfoliation, and/or cracks may be present. Significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it has negatively impacted the lifespan of the tree. Tree appears to be in irreversible decline.
e. Dead or in spiral of decline – this tree exhibits very little to no signs of life.

Structure

A) Outstanding – Trees with outstanding structure for their species exhibit trunk and branch arrangement and orientation that result in a sturdy form or architecture that resists failure under normal circumstances. The spacing, orientation, and size of the branches relative to the trunk are quintessential for the species and free from defects. No outward sign of decay or pathological disease is present. Some trees exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, which would preclude them from achieving an “A” grade.
B) Above average - Trees with good to very good structure for their species. They exhibit trunk and branch arrangement and orientation that result in a relatively sturdy form or architecture that resists failure under normal circumstances, but may have some mechanical damage, over-pruning, or other minor structural

defects. The spacing, orientation, and size of the branches relative to the trunk are still in the normal range for the species, but they exhibit a minor degree of defects. Minor, sub-critical levels of decay or pathological disease may be present, but the degree of damage is not yet structurally significant. Trees that exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, would generally fall in to this category. A small percentage of the canopy may be shaded or crowded, but not in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree.

C) Average - Trees with moderately good structure for their species, but with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a less than sturdy form or architecture, which reduces their resistance to failure under normal circumstances. Moderate levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of some of the branches relative to the trunk are not in the normal range for the species. Moderate to significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A moderate to significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be moderately elevated.

D) Well Below Average/Poor - Trees poor structure for their species and with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a significantly less than sturdy form or architecture, significantly reducing their resistance to failure under normal circumstances. Significant levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of many of the branches relative to the trunk are not in the normal range for the species. Significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be advanced.

E) Severely Compromised – trees with very poor structure and numerous or severe defects due to growing conditions, historical or recent pruning, mechanical damage, history of limb or trunk failures, advanced and irreparable decay, disease, or severe fire damage. Trees with this rating are in severe, irreparable decline, or are barely alive. Risk of full or partial failures in the near future may be severe.

ARBORIST DISCLOSURE STATEMENT

Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near trees. Clients may choose to accept or disregard the recommendations of the arborist, or to seek additional advice.

Arborists cannot detect every condition that could possibly lead to the structural failure of a tree. Trees are living organisms that fail in ways we do not fully understand. Conditions are often hidden within trees and below ground. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time. Likewise, remedial treatments, like any medicine, cannot be guaranteed.

Treatment, pruning and removal of trees may involve considerations beyond the scope of the arborist's services such as property boundaries, property ownership, site lines, disputes between neighbors, and other issues. Arborists cannot take such considerations into account unless complete and accurate information is disclosed to the arborist. An arborist should then be expected to reasonably rely upon the completeness and accuracy of the information provided.

Trees contribute greatly to our enjoyment and appreciation of life. Nonetheless, they are subject to the laws of gravity and physiological decline. Therefore, neither arborists nor tree owners can be reasonably expected to warrant unfailing predictability or elimination of risk.

Trees can be managed, but they cannot be controlled. To live near trees is to accept some degree of risk. The only way to eliminate all risk associated with trees is to eliminate all trees.

Risk assessments were neither requested nor performed on any of the trees for this project.

Education
B.S., Landscape Architecture, California State Polytechnic University, Pomona, 1985
Graduate, Arboricultural Consulting Academy, American Society of Consulting Arborists, Chicago, Illinois, February 2002
Graduate, Municipal Forestry Institute, Lied, Nebraska, 2012

Experience
Consulting Arborist, Carlberg Associates, 1998-present
Manager of Grounds Services, California Institute of Technology, Pasadena, 1992-1998
Director of Grounds, Scripps College, Claremont, 1988-1992

Certificates
Certified Arborist (#WE-0575A), International Society of Arboriculture, 1990
Registered Consulting Arborist (#405), American Society of Consulting Arborists, 2002
Certified Urban Forester (#013), California Urban Forests Council, 2004
Qualified Tree Risk Assessor, International Society of Arboriculture, 2011

AREAS OF EXPERTISE

Ms. Carlberg is experienced in the following areas of tree management and preservation:

- Tree health and risk assessment
- Master Planning
- Historic landscape assessments, preservation plans, reports
- Tree inventories and reports to satisfy jurisdictional requirements
- Expert Testimony
- Post-fire assessment, valuation, and mitigation for trees and native plant communities
- Value assessments for native and non-native trees
- Pest and disease identification
- Guidelines for oak preservation
- Selection of appropriate tree species
- Planting, pruning, and maintenance specifications
- Tree and landscape resource mapping – GPS, GIS, and AutoCAD
- Planning Commission, City Council, and community meetings representation

PREVIOUS CONSULTING EXPERIENCE

Ms. Carlberg has overseen residential and commercial construction projects to prevent damage to protected and specimen trees. She has thirty-five years of experience in arboriculture and horticulture and has performed tree health evaluation, value and risk assessment, and expert testimony for private clients, government agencies, cities, school districts, and colleges. Representative clients include:

The Huntington Library and Botanical Gardens
The Los Angeles Zoo and Botanical Gardens
The Rose Bowl and Brookside Golf Course, Pasadena
Walt Disney Concert Hall and Gardens
The Art Center College of Design, Pasadena

1 Executive Summary

Rincon Consultants, Inc. (Rincon) was retained by the Los Angeles Unified School District (LAUSD) to complete a historical resources evaluation of the Reseda High School campus (subject campus), located at 18230 Kittridge Street, Los Angeles, California. The subject campus is located in the Reseda neighborhood of the San Fernando Valley. Initially constructed between 1954 and 1955, the campus spans an irregular-shaped parcel of approximately 30 acres that contains 55 buildings and structures, including 24 permanent buildings and structures and 31 portable buildings.

This evaluation was prepared to inform future planning efforts and to facilitate compliance with LAUSD's cultural resource policies and the California Environmental Quality Act (CEQA), which requires lead agencies to consider the impacts of proposed projects on historical resources. All work completed as part of the current effort was conducted in accordance with the requirements of CEQA and applicable local regulations. The current study included background research, an intensive-level field survey, and preparation of this Historical Resources Evaluation Report.

Based on the current study, the built improvements at Reseda High School are recommended as ineligible for listing in the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and for local designation under any applicable criteria. The school is one of many high schools developed in response to rapid growth of the San Fernando Valley in the years after World War II, and while the campus has not been extensively altered, it does not clearly embody the characteristics of a postwar modern functionalist school campus per the registration requirements of *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*.[1] Specifically, Reseda High School does not exhibit many of the character-defining features required of eligible campuses, including easily identifiable indoor-outdoor spaces, a unified campus plan with buildings oriented toward courtyards, or buildings that display a distinctively Modernist design idiom. As a result, the buildings and the overall campus of Reseda High School do not appear eligible for federal, state, or local designation under any applicable criteria. Therefore, Reseda High School is not considered a historical resource for the purposes of CEQA.

Rincon Senior Architectural Historian Steven Treffers served as the project lead, with oversight and quality assurance/quality control provided by Architectural History Program Manager Shannon Carmack. Additional assistance was provided by Rincon architectural historians Rachel Perzel and Susan Zamudio-Gurrola. These individuals meet and exceed the Secretary of the Interior's Professional Qualifications Standards for Architectural History and History.

2 Introduction

Reseda High School is located on a generally level site in the Reseda neighborhood, north of U.S. Highway 101 and east of Interstate 405 (Figure 1). The roughly trapezoidal parcel is approximately 30 acres and is bound by Kittridge Street to the north, Etiwanda Avenue to the west, Lindley Avenue to the east, and the channelized Los Angeles River on the southwest, where it follows a northwest-southeast alignment along the border of the campus. The surrounding area is characterized primarily by single- and multi-family residential properties (Figure 2).

2.1 Regulatory Framework

CEQA requires lead agencies to consider the impacts of proposed projects on historical resources. Under CEQA, historical resources are defined properties listed in, or eligible for listing in, the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), or a local register. Eligible resources may include buildings, sites, structures, objects, cultural landscapes, and historic districts. Properties that are listed in the NRHP or found eligible for the NRHP through consensus with the State Office of Historic Preservation are automatically listed in the CRHR. Federal, state, and local designation criteria are presented below.

National Register of Historic Places

The NRHP was established by the National Historic Preservation Act (NHPA) of 1966 as "an authoritative guide to be used by federal, state, and local governments, private groups and citizens to identify the nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment."[2] The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. A property is eligible for the NRHP if it is significant under one or more of the following criteria:

- **Criterion A.** It is associated with events that have made a significant contribution to the broad patterns of our history.
- **Criterion B.** It is associated with the lives of persons who are significant in our past.
- **Criterion C.** It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction.
- **Criterion D.** It has yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting at least one of the above designation criteria, resources must also retain integrity, or enough of their historic character or appearance, to be "recognizable as historical resources and to convey the reasons for their significance."[3] The National Park Service recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several, if not all, of these seven qualities, defined as follows:

1. **Location.** The place where the historic property was constructed or the place where the historic event occurred
2. **Design.** The combination of elements that create the form, plan, space, structure, and style of a property
3. **Setting.** The physical environment of a historic property
4. **Materials.** The physical elements combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property

[2] Code of Federal Regulations 36, Code of Federal Regulations 60.2.

[3] California Office of Historic Preservation, "California Register and National Register: A Comparison (for Purposes of Determining Eligibility for the California Register)," Technical Assistance Series No. 6. (Sacramento, CA, 14 March 2006).

5. **Workmanship.** The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory
6. **Feeling.** A property's expression of the aesthetic or historic sense of a particular period of time
7. **Association.** The direct link between an important historic event or person and a historic property[4]

California Register of Historical Resources

Created in 1992 and implemented in 1998, the CRHR is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change."[5] Certain properties, including those listed in or formally determined eligible for listing in the NRHP and California Historical Landmarks numbered 770 and higher, are automatically included in the CRHR. Other properties recognized under the California Points of Historical Interest program, identified as significant in historical resources surveys, or designated by local landmarks programs may be nominated for inclusion in the CRHR. According to PRC Section 5024.1(c), a resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:

- **Criterion 1.** It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- **Criterion 2.** It is associated with the lives of persons important in our past.
- **Criterion 3.** It embodies the distinctive characteristics of a type, period, region, or method of installation, or represents the work of an important creative individual, or possesses high artistic values.
- **Criterion 4.** It has yielded or may be likely to yield information important in prehistory or history.

It is possible that a resource that does not possess sufficient integrity for NRHP listing may still be eligible for the CRHR. Furthermore, while typically NRHP eligibility requires a property to be at least 50 years of age, there is no age requirement for listing in the CRHR. Rather, regulations specify that enough time must have passed for a property to be evaluated within its historic context.

Los Angeles Historic-Cultural Monuments

Local landmarks in the city of Los Angeles are known as Historic-Cultural Monuments and are under the aegis of the Los Angeles Planning Department, Office of Historic Resources. A Historic Cultural Monument is defined in the Cultural Heritage Ordinance as follows:

> Historic-Cultural Monument (Monument) is any site (including significant trees or other plant life located on the site), building or structure of particular historic or cultural significance to the City of Los Angeles, including historic structures or sites in which the broad cultural, economic or social history of the nation, State or community is reflected or exemplified; or which is identified

[4] U.S. Department of the Interior, National Park Service. "How to Apply the National Register Criteria for Evaluation, "*National Register Bulletin* No. 15 (Washington D.C., 2002).

[5] Public Resources Code, Sections 21083.2 and 21084.1.

with historic personages or with important events in the main currents of national, State or local history; or which embodies the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period, style or method of construction; or a notable work of a master builder, designer, or architect whose individual genius influenced his or her age.[6]

LAUSD Historic Context Statement, 1870 to 1969

In addition to using all applicable criteria of significance, this evaluation utilized the methodology and framework for evaluations described in the 2014 *LAUSD Historic Context Statement*. Adopted by the LAUSD Board of Education, the *LAUSD Historic Context Statement* offers a consistent, standard approach for evaluating schools and campuses throughout the district. The document utilizes the NRHP Multiple Property Documentation (MPD) format, which provides a comparative, context-driven framework for evaluating related properties. As discussed in that document, "the MPD approach defines themes of significance, eligibility standards, and related property types. Properties sharing a theme of significance are then assessed consistently, in comparison with resources that share similar physical characteristics and historical associations."[7]

2.2 Methods

This historical resources evaluation was completed in accordance with recognized professional standards, following the Secretary of the Interior's Standards for Preservation Planning, Identification, Evaluation and Registration; California Office of Historic Preservation; and National Park Service professional standards and guidelines. Applicable national, state, and local level criteria were considered, as were the context-driven methods and framework used in *LAUSD Historic Context Statement, 1869-1970*, and other applicable historic context statements, including SurveyLA, the citywide historic resources survey conducted by the Los Angeles Office of Historic Resources.[8]

Efforts were made to identify previous historical resource evaluations of the subject campus and other related LAUSD schools. This included a records search of the California Historical Resources Information System, conducted at the South Central Coastal Information Center at California State University, Fullerton in June 2017. The California Historical Resources Information System search reviewed the combined listings of the NRHP, CRHR, California State Historical Landmarks, California Points of Historical Interest, and California Historic Resources Inventory. In addition, the findings of the following surveys were reviewed:

- Post-1994 Northridge Earthquake Historical Resources Surveys: These surveys were conducted for the Federal Emergency Management Agency in support of compliance with Section 106 of the National Preservation Act and recorded 71 LAUSD campuses.

[6] Los Angeles Municipal Code, Section 22.171.7, added by Ordinance No. 178,402, Effective 4-2-07

[7] Sapphos Environmental, Inc. *Los Angeles Unified School District: Historic Context Statement, 1870 to 1969* (Los Angeles Unified School District Office of Environmental Health and Safety, March 2014).

[8] Ibid. As part of SurveyLA, the Los Angeles Department of City Planning Office of Historic Resources has been developing a citywide historic context statement that provides a framework for identifying and evaluating the city's historic resources: see Los Angeles Department of City Planning Office of Historic Resources, "SurveyLA, Historic Context," https://preservation.lacity.org/historic-context (accessed 2 October 2017).

- Phase 1 and 2 Getty Surveys: These surveys were conducted in two multi-year phases between 2001 and 2004 and expanded on the post-Northridge Earthquake surveys, covering approximately 410 LAUSD campuses.[9]
- 2014 LAUSD Historic Resources Survey: Completed in 2014, this historic resources survey included 55 LAUSD campuses that, at the time of survey, were over 45 years of age. Of these, 14 were found eligible for NRHP and/or CRHR listing.[10]
- SurveyLA: A multi-year, citywide historical resources survey that is currently being finalized by the Los Angeles Office of Historic Resources.

Property-specific research was also conducted to document the construction and alteration history of the subject campus and to explore potential significant associations. A package of historic aerial and topographic maps and Sanborn Fire Insurance Maps for the property was acquired from Environmental Data Resources. Other sources reviewed include the combined collections of ProQuest historical newspapers, historic *Los Angeles Times*, Los Angeles Public Library (including the California Index), University of Southern California Libraries and Special Collections, and the online photographic collection of the Huntington Library and yearbooks at Classmates.com. Rincon staff also reviewed Vault Drawings on file with LAUSD that include architectural plans and drawings detailing the construction and alteration histories of the subject campus and its buildings.

Steven Treffers and Shannon Carmack conducted an intensive-level survey of the subject campus on July 11, 2017. All buildings and structures on the subject campus were photographed and documented in field notes describing character-defining features, materials, and alterations. The survey included the exteriors and interiors of campus buildings.

2.3 Previous Historical Resource Surveys

The subject campus was previously identified by SurveyLA in 2015 as part of the historic resources survey of the Reseda-West Van Nuys Community Plan Area.[11] At that time the campus was recommended as eligible for federal, state, and local designation as a historic district under Criteria A/1/1 and C/3/3, where it was found to provide an excellent example of a post-World War II high school campus, reflecting LAUSD school planning and design concepts along with the increase in facilities that occurred to accommodate post-World War II growth in the San Fernando Valley.

3 Campus Site Description and History

3.1 Overview Description

Reseda High School occupies a roughly trapezoidal, 30-acre parcel in the Reseda neighborhood of Los Angeles. The campus boundaries follow Kittridge Street on the north, Etiwanda Avenue on the west, and Lindley Avenue on the east. The southern boundary parallels Victory Boulevard before tracing the southeast-to-northwest route of the Los Angeles River. Residential development is predominant in the areas directly north, south, and east of the school, and Reseda Lake Park neighbors the campus to the west. Originally constructed in 1955, the campus displays minimal elements of the Mid-Century Modern architectural style. Of the 55 permanent and portable buildings and structures on the campus, 20 date to the school's opening in 1955. new facilities continued to be added until as recently as 2005.

The campus exhibits some elements of a hybrid finger-and-cluster-plan, with the Administrative, Library, Homemaking, Academic, Classroom, and Assembly buildings situated around a landscaped central quadrangle in the northwestern section of the campus. South of this main cluster, the Art, Industrial Arts, and Cafeteria buildings are oriented generally east-west around landscaped courtyards. A paved service road marks the eastern and southern perimeter of this core of campus facilities. Situated along the outside edge of the roadway are the boys' and girls' gymnasia, the Utility Building, and several less substantial permanent and portable classroom buildings. The original core campus buildings share common design elements, including rectangular plans, flat roofs, horizontal components, board-formed concrete and masonry construction, and overhangs sheltering steel casement windows.

A primary campus entrance faces Kittridge Street to the north, allowing access to the grounds at a point just outside the single-story Administrative Building. The one-story Library and Homemaking buildings and two-story Science and Academic buildings extend west and east, respectively, from the Administrative Building, forming a rough H-plan. Breezeways and covered, exterior walkways link most of the campus' core buildings. Breezeway shelters near the main campus entrance are made of recessed concrete, supported by reinforced concrete pillars. Brickwork frames several doorways and forms bands on the lower reaches of many exterior walls, serving as a unifying stylistic motif on many of the school's original buildings.

Aside from the school's original buildings, nearly three dozen buildings were added after 1955, most of which are portable. Largely utilitarian in style, these buildings cluster just south of the Homemaking Building and Industrial Arts Building 2 and north and east of the Girls' Gymnasium. Aside from a circa-1970, two-story classroom building, these facilities are all one-story in height. Common design elements among these buildings include stucco- and T1-11-clad exterior walls, covered porches, and aluminum-framed windows. Landscaping in these parts of the campus is minimal.

Landscaping elsewhere on the school grounds is simple but abundant, consisting primarily of lawns and mature planted trees. Building setbacks along Kittridge Street and much of the school's Etiwanda Avenue frontage allow for lawns on the western and northern edges of the campus. The central quadrangle and several smaller courtyards separate the core buildings. These areas include lawns crossed by concrete walkways, planted with mature trees and several varieties of shrub.

Concrete benches line the northern end of the quadrangle, and a semicircular area with picnic tables is located nearby.

Sports fields and courts and parking lots fill most of the easternmost section of the campus, along Lindley Avenue. These include baseball diamonds, clay tennis courts, and basketball courts. A football field and dirt running track, flanked by bleachers, occupy the southeastern corner of the property. Their orientation parallels that of the channelized Los Angeles River, which flows southeasterly along the southwestern edge of the campus. A chain link perimeter fence encloses much of this rear section of the school grounds.

3.2 Site History and Construction Chronology

The site of Reseda High School was farmland from 1928 until 1952. The western half of the property was in use as an orchard, while the eastern side of the parcel included a crop field and a small cluster of buildings in the northeastern corner. As late as 1947, the surrounding properties were also agricultural plots and/or rural homes, though the properties north of the Los Angeles River appear to have been substantially larger than most of those south of the river (Figure 13).[12] A notable exception to the area's predominantly agricultural character was Reseda Park, situated immediately west of the present Reseda high campus. The park opened in 1931, and a subsequent round of improvements took place there between 1932 and 1933, under the direction of Reconstruction Finance Corporation and the Los Angeles County Welfare Department.[13] Between 1947 and 1952, thorough suburban development took place on the former agricultural fields to the immediate north, east, and southwest of the future high school campus (Figure 14).[14]

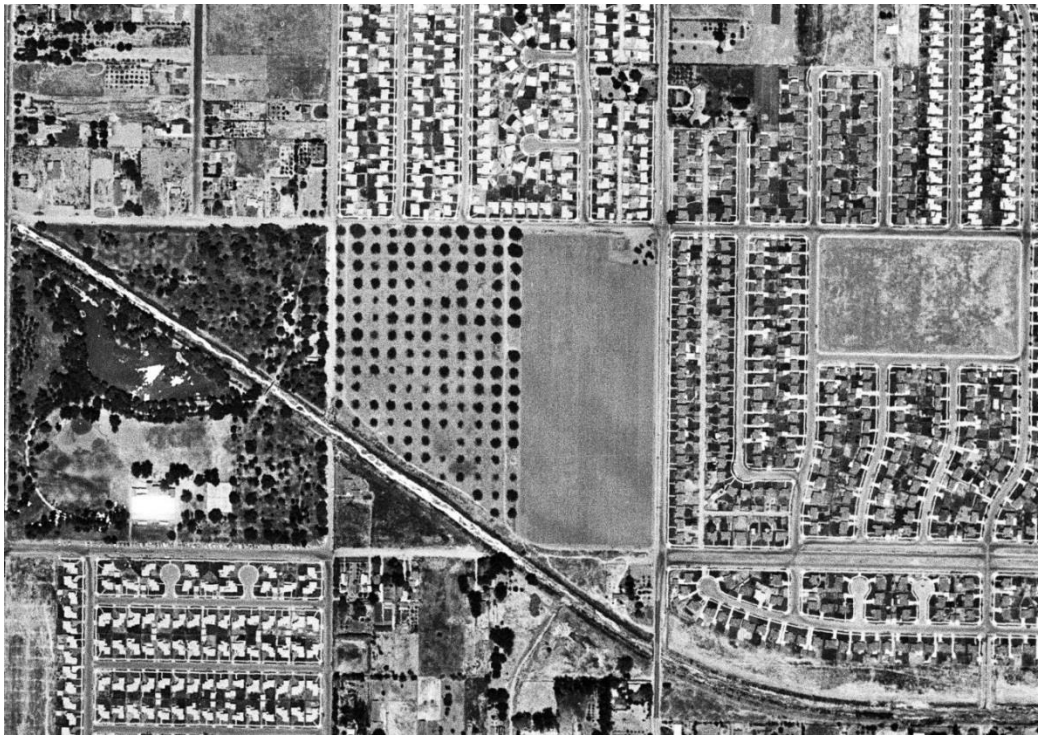
Figure 14 1952 Aerial Photograph Depicting Site of Reseda High School (at center of frame) and Environs



Rapid postwar residential development in the area around the Reseda High School site was just one manifestation of a wider suburban population boom in the Los Angeles region. The fast-growing school-age population that coincided with the construction of these new homes underscored for Los Angeles City School District officials the need for new facilities. As explained in the *LAUSD Historical Context Statement*:

> With the end of World War II, the United States turned its attention to the long-awaited postwar—and post–Great Depression—expansion. The magnitude of the construction and population boom that followed, and its effect on the built environment, have been well documented. A wealth of literature has been devoted to the era's severe housing crisis, for example, and the array of initiatives launched to address it.
>
> Less widely explored in the literature, but equally pressing at the time, was a dire classroom shortage. In 1949–1950, enrollment at U.S. elementary and secondary schools stood at 25.1 million. In one decade, this number expanded by nearly 50 percent to approximately 36 million; by 1971, it reached 46 million. In 1955, in the midst of this boom, "editors at theArchitectural Forum worried, 'every 15 minutes enough babies are born to fill another classroom and we are already 250,000 classrooms behind.' The rising population of young American children made school building, together with housing, the most widely discussed architectural challenge after World War II."
>
> Perhaps in no other state of the union was this growth felt more acutely than in California.The booming birth rate was accompanied by a wave of in-migration, as new settlers were drawn by established employment centers in, among other things, the aerospace industry, which had shifted operations to peacetime production. In Southern California, one region with a particularly strong pull in this regard was the San Fernando Valley. The postwar construction

> boom transformed miles of the San Fernando Valley's agricultural lands into new residential communities, and the population—and demands on schools—expanded accordingly.
>
> School districts around the country struggled to keep up with unprecedented demand and overcrowded classrooms. Adding to the challenges facing school districts was the need not only for new schools, in particular in emerging suburban communities, but also the need to repair and maintain aging school plants, facilities, and equipment.[15]

In response to these pressures, the Board of Education submitted, and voters approved, a series of three school bonds, starting in 1946, to finance both the construction of new facilities and improvements at existing campuses. The 1946 bond issue alone totaled $76 million, financing the construction of 66 new schools. These measures were insufficient, however, and the Board issued two subsequent bonds in 1952 and 1955.[16] According to a 1954 Los Angeles Times article, Reseda High School was scheduled to be the first new school to be built using 1952 bond monies.[17] The Board of Education awarded the school design contract to Los Angeles architectural firm Allison & Rible and structural engineers Ropp and Ropp. General contracting firm, the James I. Barnes Company, won the $3.9-million contract for the school's construction.[18] Officials estimated the campus would initially accommodate 2,500 students, with plans to eventually host another 500 students in temporary buildings.[19]

Postwar Los Angeles schools increasingly differed from their pre-war predecessors in that new schools were often designed to be relatively informal in appearance and functional in their layout. This new ideal is briefly described in the *LAUSD Historical Context Statement* as follows:

> Campus planning and site-specific design also became increasingly important, as new residential areas emerged from former agricultural lands, and school builders and planners had the acreage to plan an entire campus created for new residential communities. In this era, ideas about planning at the scale of the neighborhood included the generous use of outdoor spaces and landscaping and a zoned design that turned the campus inward and separated pedestrians and automobile traffic, for safety and accessibility. Although many variations were proposed, the modern campus plan called for "small separate units connected by arcades or passageways and attractively grouped. This type of arrangement is quite flexible and eliminates much of the institutional atmosphere of the large compact structures."[20]

Allison & Rible designed Reseda High School as a decentralized campus of 20 one- and two-story buildings. These facilities were adjoined by covered walkways or separated by plazas and lawns. The design segregated the school's various uses in purpose-built, single-use facilities.[21] Among others, the campus' original structures included the Administrative, Home Making, Science, Academic, Art, and Industrial Arts buildings (Figure 15 and Figure 16).[22]

Figure 15 Allison & Rible, Architects (1953) Detail of Key Plot Plan of Reseda High School

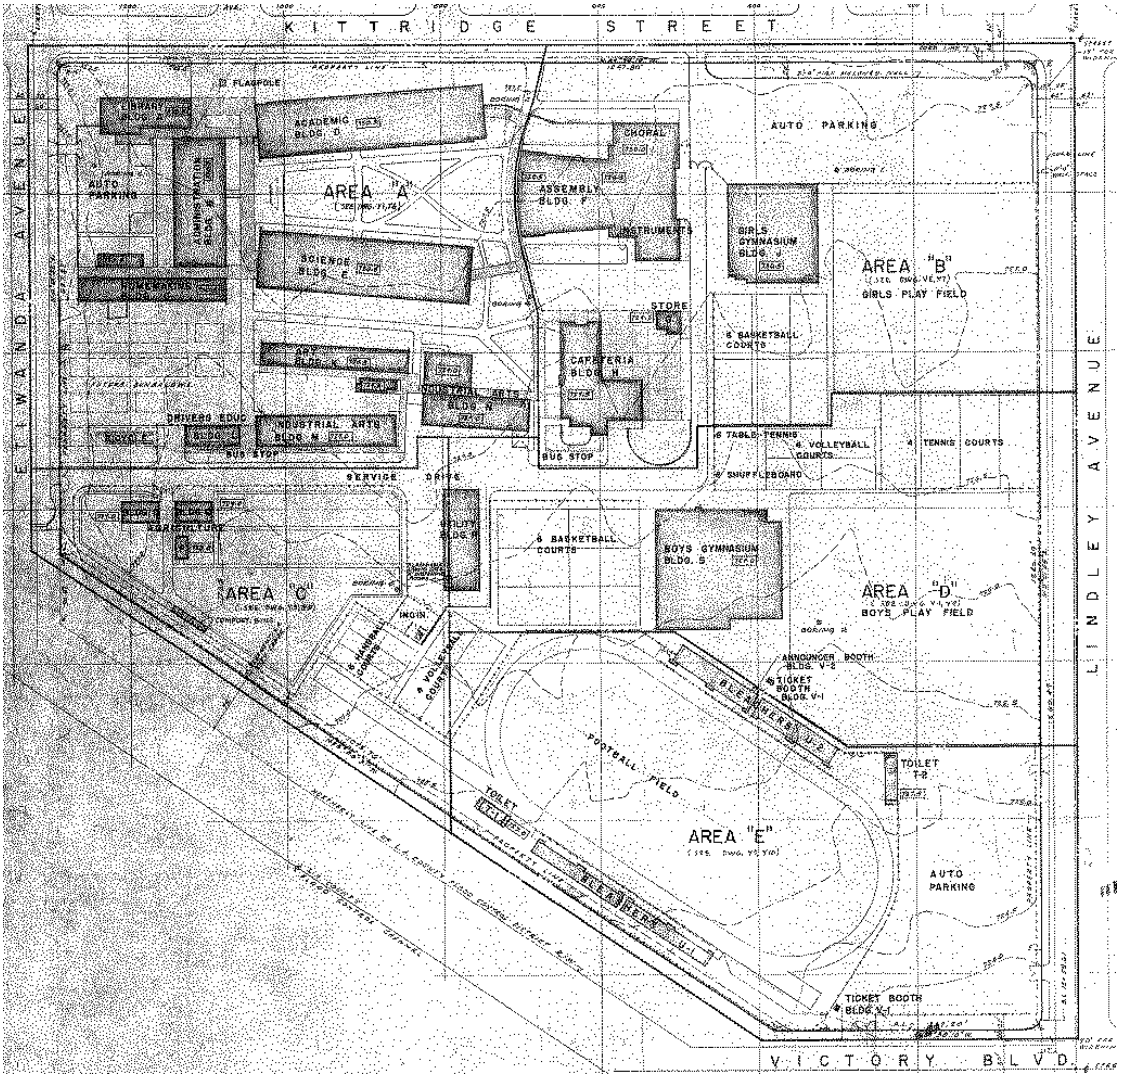

Figure 16 Circa-1955 Aerial Photograph of Reseda High School

Reseda High School opened its doors to students in September 1955, becoming the Los Angeles school system's 500th campus. Its inaugural student body of 1,500 sophomores and juniors congregated primarily in two two-story classroom buildings, designated for academic and scientific courses.[23]

In the six decades after Reseda High School opened, a number of new buildings were erected on the campus, most of which were relatively minor classroom buildings. In the early 1960s, two new classroom buildings were added near the Etiwanda Avenue frontage. These buildings were removed by 1972 and replaced with two portable buildings between 1983 and 1989. Crews erected the two-story Classroom Building T nearby between 1967 and 1977.[24] The identity of the building's architect could not be ascertained for the present study. By 1985, a district plot plan suggests, at least two of these buildings were in use as the Zane Grey Continuation High School.[25] Beginning in the mid- to-late 1980s, a garden area south of Industrial Arts Building 1 gradually gave way to new portable classroom buildings. A cluster of six such buildings appeared between 1983 and 1989, while two

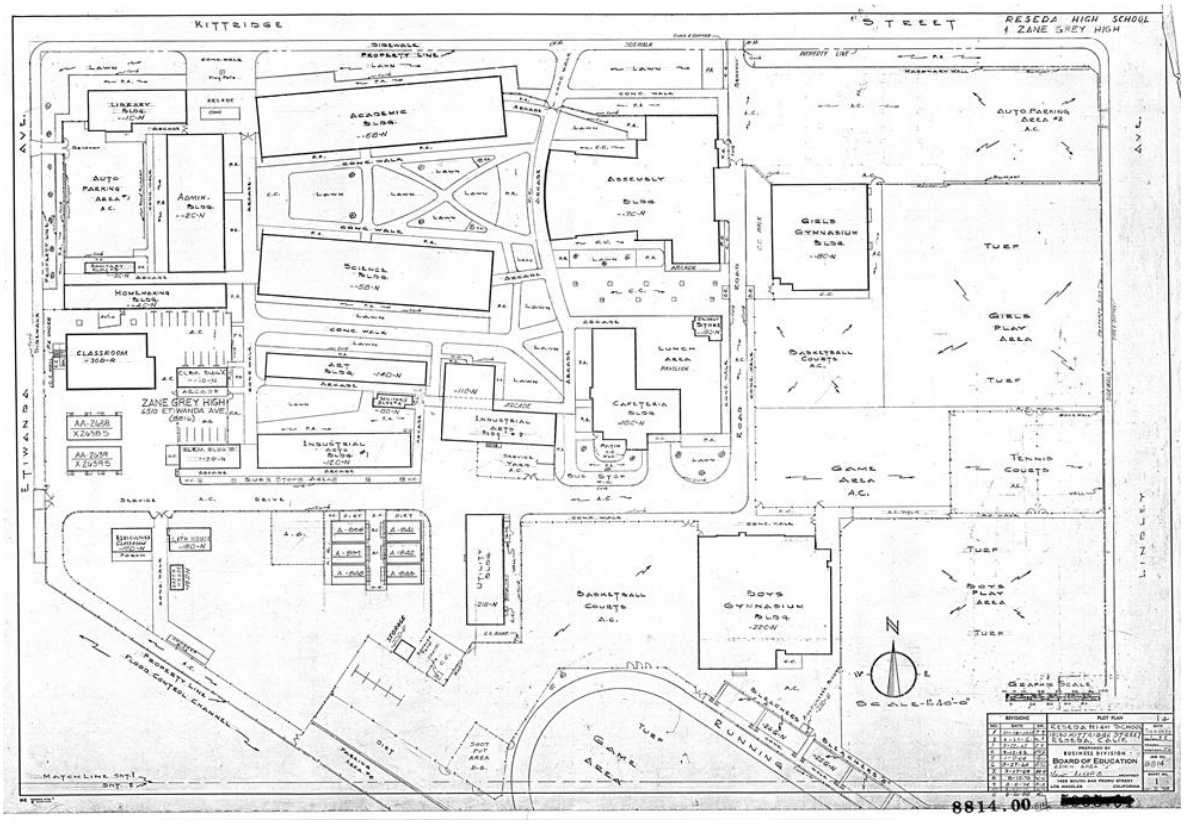
additional buildings came to occupy the remainder of the former garden between 1995 and 2002.[26] In 1994, the district approved plans to repair the earthquake-damaged structural elements of the Boys' and Girls' gymnasia.[27] I

Figure 17 1955 Plot Plan, Reseda High School, Revised in 1985



Aerial photographs to the present suggest that the blocks immediately surrounding Reseda High School have maintained their character in large part as predominantly residential, composed mostly of single-family housing. In the area just northwest of the high school, however, multi-family residential and commercial uses began to be developed sometime between 1952 and 1964 and appears to have been completed by 1977.[28]

4 Historic Overview

4.1 Focused Neighborhood History

This section presents historic context and background on the development and settlement history of the area surrounding Reseda High School, in Reseda specifically and the San Fernando Valley more generally. The following draws on the LAUSD *Historic Context Statement* and the Los Angeles Office of Historic Resources SurveyLA survey report.

The development of Reseda High School is tied to the exponential growth of the San Fernando Valley in the post-World War II period. As noted in the LAUSD Historic Context Statement:

> The biggest challenge facing the district during the postwar era was keeping up with demand. In Southern California, one of the areas with the most rapid growth was the San Fernando Valley. Between 1930 and 1950, population expansion in the San Fernando Valley was remarkable even by Southern Californian standards. With new settlers drawn by the area's emerging aerospace and entertainment industries, residential expansion had already been under way in the San Fernando Valley by the 1920s and 1930s. By the onset of the Great Depression, for example, the valley had become one of the United States' most important hubs for the aviation industry. Given the valley's concentration of jobs, population doubled from approximately 51,000 in 1930 to 112,000 by 1940.
>
> With the advent of World War II and an infusion of federal funds for defense industry spending, these figures skyrocketed by another 50 percent in five years, increasing from 112,000 in 1940 to 176,000 by 1945. Between 1945 and 1950, a nearly fourfold increase was recorded, with figures climbing to 402,000. Given the magnitude of this expansion, a majority of post-1945 school construction for the district overall took place throughout the San Fernando Valley.[29]

The following excerpt from the 2015 SurveyLA historic resources survey report for the Reseda-West Van Nuys Community Plan Area demonstrates that these trends were experienced throughout the San Fernando Valley during this period:

> Residential development skyrocketed in the Survey Area during the postwar period. Between 1945 and 1950, the San Fernando Valley's population more than doubled to a total of 402,538 residents. Between 1940 and 1950, Reseda grew from a population of 3,725 to 14,810; Van Nuys grew from 28,268 to 79,973. Housing developers could barely keep up with the demand, resulting in the development of new neighborhoods that catered to a variety of income levels, ranging from economical tract houses to communities of custom-designed residences sited on large, half-acre lots. Many were designed in various iterations of the Ranch style, which was immensely popular at the time and … paid homage to the community's rural roots and historically rustic culture. New developments touting names such as Meadowlark Park (designed by notable architect Edward Fickett) and Louise Park Estates (built by notable developer Julian Weinstock) advertised their single-family homes heavily in the *Los Angeles Times*. The work of Fickett and Weinstock in Reseda speaks to the breadth of residential design in the Valley during the postwar period. Prolific and influential, Fickett was known for his Contemporary Ranch and Mid-Century Modern designs for subdivisions all over the Valley: Meadowlark Park was one of

[29] Sapphos Environmental, Inc., *LAUSD Historic Context Statement* (p.101).

many neighborhoods to boast a "modern" aesthetic of dynamic rooflines, floor-to-ceiling windows, and low, ground-hugging forms. Weinstock, an architect as well as a developer, designed and built numerous single-family residences in the Valley during the 1950s; he is best known for his Traditional Ranch neighborhoods, with rustic decorative elements evoking the Valley's idealized rural past.

Rapid residential development was accompanied by the rise of various commercial properties serving the day-to-day needs of the area's steadily increasing population. Reseda's 1920s business district, centered at the intersection of Reseda Boulevard and Sherman Way, saw construction of new one- and two-story commercial buildings, alongside local institutions like the Reseda Theater (designed by S. Charles Lee and completed in 1948). Development in the commercial center development between the 1940s and 1960s greatly changed its appearance, but its low-scale and pedestrian orientation remained. Cheap land and a continuously improving highway system further aided automobile-oriented suburban development. Low-scale strip malls that catered to the automobile were built along many of the community's major boulevards.

Postwar institutional development included the construction of numerous new public school campuses in and around the residential tracts, along with churches and parks. Industrial operations also took root in the thriving area, including Anheuser-Busch's brewery and bottling works opened in 1954 on Roscoe Boulevard. In 1966, the company constructed the 17-acre Busch Gardens amusement park, complete with a bird sanctuary, monorail, boat rides, bumper cars, and free beer with admission. Although the park closed in 1977, the brewery remains in operation.

Built in 1942, the Van Nuys Army Airfield saw growth during the 1950s, including the extension of a runway to accommodate jet fighter, at which time Sherman Way was routed into a tunnel under the runway. In 1957, the property was renamed Van Nuys Airport. It continued to see private, commercial, and military uses for the next 30 years, with military use decreasing and commercial aviation and aerospace operations expanding at the property. Today the Van Nuys Airport is one of the world's busiest non-commercial airports, with hundreds of takeoffs and landings per day.

The survey area's population continued to grow during the 1960s, and residential and commercial development continued apace. As in most other parts of the San Fernando Valley, the new housing subdivisions were not open to all: a long history of racially restrictive housing and ownership practices meant that most of the Valley was "a thoroughly white domain" even through the post-World War II boom. Restrictive covenants had factored into patterns of town building and settlement going back to the Valley's earliest history. While the Supreme Court had outlawed restrictive covenants in 1948, racism in the real estate market persisted through various off-the-record tactics including unofficial "gentleman's agreements," discriminatory lending practices, and brokers' tendency to "steer" minorities to the historically diverse communities of Pacoima and San Fernando. These tactics made it nearly impossible for non-whites to purchase houses in the subdivisions that were being developed in and around Reseda. Deed restrictions and discriminatory practices were not effectively addressed until well into the 1970s.

The survey area continued to develop at a steady pace through the 1960s and into the 1970s, as any remaining open land was acquired by developers and subdivided into housing tracts. Reseda's semi-rural identity slowly faded as the area suburbanized, although traces of it survive in the large lots that remain in several areas of the community. A rare survivor is a portion of the

Jue Joe Ranch, established by Chinese immigrant Jue Joe in West Van Nuys in 1919. This incongruous property sits on the busy thoroughfare of Vanowen Street. New institutional and recreational properties continued to appear in the survey area during this time, including the Los Angeles Jewish Home for the Aged. Established on Victory Boulevard in 1962, this was the second location for the institution, originally founded in 1915 as the Hebrew Home for the Aged. Its location in Reseda reflected the growth of the San Fernando Valley's Jewish population after World War II. Among the new recreational properties in the survey area was the public Van Nuys Golf Course, completed on airport property in 1968. Construction of LAUSD campuses continued, and included unusual facilities like Diane S. Leichman High School, constructed in 1971 as one of the first high school campuses in the district for developmentally disabled students.

The survey area weathered the 1971 San Fernando (Sylmar) earthquake fairly well, but its built environment saw significant damage in the 1994 Northridge earthquake. This temblor, which was actually centered directly beneath Reseda not Northridge, killed 57 people and caused billions of dollars in damage. Many of the survey area's single-family houses were damaged, with the most common damage being fallen chimneys and cracked or shifted porches. As a result, chimney replacements are common throughout Reseda and west Van Nuys.[30]

5 Associated Design Professional Biographies

The following section presents biographies for design professionals who are known to be associated with Reseda High School.

5.1 Allison & Rible

Architectural firm Allison & Rible designed the original 1955 Reseda High School campus. The firm dates to 1944, when George B. Allison and Ulysses Rible founded the partnership.[31]

Allison was born in India in 1904 and first studied architecture at Carnegie Institute of Technology, graduating with a bachelor's degree in 1925. Allison earned his master's degree in architecture In 1926 from the University of Pennsylvania. He served as a draftsman in a number of East Coast architecture firms before relocating to Los Angeles. He was named president of the American Institute of Architects (AIA) in 1948.[32] He died in Los Angeles County on June 25, 1977.[33]

Ulysses F. Rible was born in Chicago, Illinois, on November 22, 1904.[34] In 1920, after a series of relocations during his childhood and adolescence, Rible and his family settled in Atascadero in San Luis Obispo County, California.[35] Archival research conducted as part of this study was unable to locate extensive information regarding Rible's education and professional experience prior to the establishment of his partnership with Allison. Rible was named a fellow of the AIA in 1957 and served as president of the state Board of Architectural Examiners from 1946 to 1955 and as a regional director of the AIA.[36] Rible died in San Diego County on January 28, 1982.[37]

Allison & Rible specialized in the design of education buildings, including primary, secondary, and post-secondary schools. Their designs were in styles that typically fell under the broad category of architectural Modernism. Many of their largest commissions were for colleges and universities, including Claremont McKenna Men's College, University of California, Los Angeles (UCLA), Cal Poly San Luis Obispo, and Los Angeles City College. After Rodney Robinson and Raymond Ziegler joined the firm in 1958, the name was formally changed to Allison, Rible, Robinson & Ziegler. Leo Daly Architects eventually acquired the firm in 1969.[38]

6 Significance Evaluation

This evaluation utilized the framework for historic resource assessments described in the *LAUSD Historic Context Statement, 1870-1969*, which follows the NRHP MPD format that "defines themes of significance, eligibility standards, and related property types. Properties sharing a theme of significance are then assessed consistently, in comparison with resources that share similar physical characteristics and historical associations." In addition, this evaluation used the MPD-format historic context statements prepared as part of SurveyLA that similarly identify themes of significance along with associated registration requirements.

In addition to each of the applicable federal, state, and local designation criteria, two evaluation frameworks and their associated eligibility standards and integrity thresholds from the *LAUSD Historic Context Statement* and SurveyLA were identified and applied to this evaluation after careful consideration of all themes and subthemes. Each building on the campus was evaluated for eligibility both individually and as a contributor to any potential historic district.

Evaluation Framework 1

Context:	Public and Private Institutional Development | Education
Theme:	LAUSD | Educating the Baby Boom: the Postwar Modern, Functionalist School Plant, 1945-1969
Property Type:	Institutional/Education
Property Subtypes:	Elementary, Junior High Schools, and High School Buildings and Campuses
Period of Significance:	1945 to 1969
Area of Significance:	Education
Geographic Location:	Citywide, with concentrations in the San Fernando Valley and West Los Angeles
Area of Significance:	A/1

Eligibility Standards

- Clearly embodies the characteristics of a postwar modern functionalist school campus
- Displays a unified, functional site design, with buildings extending across the site and oriented in relation to outdoor spaces (courtyards, patios, outdoor play areas)
- One-story massing for elementary schools; up to two-stories for junior/high schools
- Classrooms, in detailing and plans, clearly express their function, with axial, fingerlike wings, plentiful fenestration, and connections to the outdoors
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features – Buildings/Structures

- Building plans and site design clearly express their function; classroom wings often exhibit one-story "finger-like" wings, arranged on an axis
- Easily identifiable indoor-outdoor spaces, connections to classrooms through the incorporation of patios, courtyards, and outdoor canopied corridors
- One-story massing, particularly for elementary schools; up to two to three stories for junior and high schools

- Building types and plans expressive of postwar ideals in school design; these can include (1) finger-plan schools (usually in 1940s through 1950s); (2) cluster-plan schools (beginning in 1950s); and (3) variations and combinations of these typologies clearly expressive of the ideals for informality, indoor-outdoor connections, and zoned planning for the site
- Varying elevations might display differentiated window sizes and configurations, in order to tailor interior light to sun patterns and create cross-lit classrooms

Character-Defining Features – Campus/District

- Unified campus design includes most or all of the following attributes: lack of formality and monumentality; low massing (usually one stories for classrooms and up to two stories for auditoriums/multipurpose rooms); strong geometric ordering of buildings and outdoor spaces; decentralized, pavilion-like layout; rational, function driven site design; buildings extend across the site; buildings are oriented to outdoor spaces (courtyards, patios, outdoor areas), purposeful indoor-outdoor integration
- Automobile traffic/drop-off areas separated from campus; linked to interior via extended canopied corridors
- Buildings often turn inward, toward green spaces and courtyards, lawns
- Outdoor corridors, sheltered beneath simple canopies, forming links between the buildings of the campus
- Classrooms often consist of a series of axial, modular units
- An informal, domestic scale for the buildings and campus might be especially evident in elementary schools
- Swaths of patios, terraces, and plantings adjacent to and alternating with buildings
- Generous expanses of windows, including steel- and wood-framed multi-light windows, in awning and hopper casements, clerestories, and fixed panes
- Flat roof or broken-plane roof often used for lighting and acoustical issues
- Modular design, with a rhythmic, asymmetrical but balanced composition
- Usually displays a modern design idiom, usually either regional modernist (with use of native materials such as stone, brick, and wood siding and/or framing), International Style modernist, or, by the early 1960s, Late Modern (more expressive and sculptural)
- Some examples might include some degree of historicist detailing or styles popular in the postwar period (such as American Colonial Revival); these are less common than modernist examples
- May have been designed by a prominent architect of the period
- Often associated with post–World War II suburbanization and growth near major employment centers beyond the city periphery (such as the San Fernando Valley and southwest Los Angeles)
- Often built in residential neighborhoods on large expanses of land, with swaths of land devoted to landscape design and playing fields (in particular for high school campuses)

Integrity Considerations

- Retains most of the essential physical features from the period of significance
- School expansion and new construction over the years, in particular in the postwar period, might have resulted in the addition of in-fill buildings and structures in areas that were originally designed open spaces. Such new additions should not interfere with or serve as a visual

impairment to the designed connections between buildings, in particular classroom wings, and adjacent outdoor patios and spaces.

- Many postwar schools were designed to be easily expandable as enrollment increased; the original site design and building types and plans should be readily discernible. If additional wings were added or the campus extended, the additions should be compatible with and visually subordinate to the original
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Should retain integrity of Setting, Materials, Design, Workmanship, Feeling, and Association from its period of significance
- Addition of portable or permanent buildings after the period of significance acceptable as long as original campus design is intact

Evaluation Framework 2

Context: Architecture and Engineering, 1850-1980 | L.A. Modernism, 1919-1980

Theme: Post-War Modernism, 1946-1976 | Mid-Century Modernism, 1945-1970

Property Type: Institutional

Geographic Location: Citywide - known concentrations in Silverlake, Hollywood; Hollywood Hills; Brentwood, and communities largely developed in the post-World War II era, such as those in the South Bay (Playa del Rey, Westchester) and the San Fernando Valley

Area of Significance: C/3

Eligibility Standards

- Exhibits quality design through distinctive features

Character-Defining Features

- Direct expression of the structural system, often wood or steel post and beam
- Flat roofs, at times with, wide overhanging eaves
- Floor-to-ceiling windows, often flush mounted metal framed
- For the National Register, property must possess exceptional importance if less than 50 years of age
- Horizontal Massing
- If Expressionistic: sculptural forms intersecting with geometric volumes
- If Expressionistic: curved, sweeping wall surfaces
- If Expressionistic: dramatic roof forms, such as butterfly, A-frame, hyperbolic paraboloid, folded plate or barrel vault
- Simple, geometric volumes
- Unornamented wall surfaces

Integrity Considerations

- Original garage doors may have been replaced
- Original setting (surrounding buildings, landscape) may not be intact (this applies to individual resources only; buildings associated with corporate or institutional

- Original use may have changed
- Replacement of some windows and doors may be acceptable if the openings have not been resized and original fenestration patterns have not been disrupted
- The addition of decorative elements to originally sparse façades
- The addition of security features such as screen doors and bars at windows
- The painting of surfaces (wood) that might have originally been unpainted

6.1 Designation Criteria A/1/1

Historic District Evaluation: Reseda High School does not appear eligible for federal, state, or local designation as a historic district under Criteria A/1/1. The school is one of numerous high schools developed in response to the rapid growth of the San Fernando Valley in the years after World War II. However, the campus does not appear to have a significant association with the settlement patterns of Reseda. The surrounding area was already being developed with residential neighborhoods when development of the campus began. The main cause of increased settlement in the area was the growing aerospace industry following World War II and the campus' construction was simply a response to the need for additional institutional services in support of the growing population. While the campus has not been extensively altered, it does not clearly embody the characteristics of a postwar modern functionalist school campus per the registration requirements of *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*. Most notably, the campus does not feature a symmetrical site plan, which is characteristic of eligible schools from the post-World War II era. The buildings are neither organized along an axis, as seen in finger-plan school plants, nor grouped as modular standalone units around a central courtyard, as seen in cluster-plan school plants. The school does not feature the strong geometric ordering of buildings and outdoor spaces, or modular design reflecting significant changes in LAUSD school campus development during this era per the *Los Angeles Unified School District Historic Context Statement, 1870 to 1969*.

Individual Resource Evaluation: As described above, the Reseda High School campus is not eligible as a historic district because it does not feature a symmetrical site plan or ordering of buildings, reflecting development patterns for educational institutions during the post-World War II era. Furthermore, none of the individual buildings are distinctively representative of post-World War II school design such that they qualify for individual eligibility under Criteria A/1/1.

6.2 Designation Criteria B/2/2

Historic District and Individual Resource Evaluation: As a public high school, the subject campus and its individual resources are associated with a number of individuals who attended, visited, or taught at the school. However, per the guidance of the National Park Service, properties that are significant for their association with an important person in our past, must illustrate a person's important achievements.[46] Archival research completed as part of this study identified an association between the campus and former teacher and photographer Warren King. In 1955, King established one of the first photography departments among Los Angeles area high schools. His program became a

[46] U.S. Department of the Interior, National Park Service. 2002. *How to Apply the National Register Criteria for Evaluation*(p. 14). National Register Bulletin No. 15. Washington, DC.

prototype for other schools.[47] Although Mr. King's achievement is impressive, it does not appear to have had a significant impact on national, state, or local history to warrant eligibility under Criteria B/2/2. Additional research failed to identify any significant associations with historic personages directly represented by the subject campus. As a result, the subject campus and its individual resources do not appear eligible for designation either individually or as a historic district under Criteria B/2/2.

6.3 Designation Criteria C/3/3

Historic District and Individual Resource Evaluation: Although the Reseda High School campus buildings feature elements of Mid-Century Modern design, their design is somewhat simplistic and lacks the distinction required of significant properties under this theme. Specifically, they do not feature a modular, rhythmic design composition, or direct expression of their structural systems, such as steel post-and-beams. While the buildings have cantilevered breezeways, these features lack architectural distinction or expressive structural qualities, and are purely utilitarian in their design. Furthermore, the buildings do not exhibit the generous expanses of fenestration that help define the concept of indoor-outdoor integration, a common design theme seen in notable examples of Mid-Century Modernism. Windows are relatively limited and do not feature the extensive glazing that characterizes the style. Supplementary research and a review of *Los Angeles Unified School District Historic Context Statement, 1870 to 1969* indicates that numerous LAUSD schools better represent the Mid-Century Modern-style architecture than the subject campus, including Grover Cleveland Charter High School, also located in Reseda and constructed in the 1950s.

As stated previously under the Criteria A/1/1 evaluation, the campus is not a significant example of school campus design principals of the time. It appears to be a combination of the finger plan and cluster plan campus designs of the post-war period but is not a good example of either approach. The main axis of the campus extends south from the primary entrance along Kittridge Street in the north. Multiple axes extend eastward from the main axis, forming landscaped courtyards between the classroom buildings. The campus plan is asymmetrical, contrary to the symmetrical layouts of finger plan schools, and features multiple courtyards differing from the cluster plans arrangement of classrooms around a single central courtyard.

Finally, the campus was designed by the architectural firm of Allison & Rible, which specialized in the design of education buildings, including primary, secondary, and post-secondary schools. Their designs were in styles that typically fell under the broad category of architectural Modernism. Many of their largest commissions were for colleges and universities, including Claremont McKenna Men's College, UCLA, Cal Poly San Luis Obispo, and Los Angeles City College. While the firm may be noteworthy for their designs of educational buildings and campuses, the Reseda High School campus is not one of their more notable works. As a result, Reseda High School and its buildings do not appear eligible for federal, state, and local designation either individually or collectively as a historic district under Criteria C/3/3.

7 Conclusion

In summary, the built improvements at Reseda High School are recommended ineligible for federal, state, and local designation under any applicable criteria. The school is one of many high schools developed in response to the rapid growth of the San Fernando Valley in the years after World War II, and while it has not been extensively altered, the campus does not clearly embody the characteristics of a postwar modern functionalist school campus per the registration requirements of the LAUSD Historic Context Statement. Specifically, Reseda High School does not exhibit many of the character-defining features required of eligible campuses, including easily identifiable indoor-outdoor spaces, a unified campus plan with buildings oriented toward courtyards, or buildings that display a distinctively Modernist design idiom. As a result, the buildings and the campus overall of Reseda High School do not appear eligible for federal, state, or local designation under any applicable criteria. Therefore, Reseda High School is not considered a historical resource for the purposes of CEQA.

Subject: **Preliminary Geotechnical Site Evaluation, Reseda High School, 18230 Kittridge Street, Reseda, California**

1.0 INTRODUCTION

Presented herein are the results of our preliminary geotechnical site evaluation for the comprehensive modernization project at Reseda High School (Site) at 18230 Kittridge Street in the Reseda area of Los Angeles, California as shown on Figure 1. Detailed plans of the modernization are not available at this time; however, the project may include seismic retrofit and/or replacement of existing buildings.

Los Angeles Unified School District (LAUSD) launch team personnel identified eleven subsurface exploration locations for geotechnical evaluation. Eight locations were explored by drilling and sampling with a truck mounted hollow-stem auger drill rig and four locations were explored utilizing a truck-mounted, cone penetrometer test (CPT) sounding rig. In one location, both a boring and a CPT were performed for correlation purposes. The approximate locations of our exploratory points are shown on the attached Geotechnical Exploration Map, Plate 1.

The subsurface exploration found the area of the school evaluated for this report to be underlain by alluvial deposits (Holocene) locally mantled with artificial fill, grass, and pavement. General descriptions of the materials encountered in the subsurface exploration are presented in the text of this report with boring specific detail presented on the attached Logs of Subsurface Data (Appendix A).

The Site falls within a State of California designated Liquefaction Seismic Hazard Zone (CGS, 1998). Therefore, to evaluate the potential for seismically induced settlement four CPTs and one boring were extended to a depth of 50 feet as required in California Geological Survey (CGS) Special Publication 117A for the evaluation of seismically induced ground settlement.

Analyses of seismically induced settlement yielded settlement on the order of 1 to 3 inches in the CPT Soundings and 2½ inches in the boring (B-8) with differential seismic settlement estimated at ¾ to 1½ inches. Preliminary lateral spread analyses for the CPT closest to the Los Angeles County Flood Control Channel indicated approximately 1½ inches of lateral spread. Based on the CGS Special Publication 117A, structural mitigation may be used within this range of seismically induced settlement and lateral spread.

The area of Reseda High School evaluated for this report was found to be suitable for the seismic retrofit and/or replacement of existing buildings from a geotechnical standpoint. This is provided recommendations presented herein are implemented in the project design and construction.

2.0 PROPOSED CONSTRUCTION

Subsurface conditions at the site were evaluated in anticipation of seismic retrofit and/or replacement of existing buildings at the subject site. The focus of the evaluation was in the northern portion of the site, where most of the existing buildings are present and adjacent the existing boys' gymnasium.

3.0 SCOPE OF SERVICES

Gorian and Associates, Inc. conducted this geotechnical evaluation for the proposed modernization project at the current Reseda High School site under the supervision of a State registered geotechnical engineer and certified engineering geologist. Our evaluation of the site included:

3.1 ARCHIVAL REVIEW

Pertinent geotechnical data available in our office was reviewed.

3.2 SUBSURFACE EXPLORATION

Eight geotechnical borings were drilled to depths ranging from 31 feet (B-1, B-3, B-4, B-6, B-7, B-9, and B-11) to 51½ feet (B-8) below the existing ground surface (bgs) to evaluate the underlying soil and groundwater conditions. A subcontractor supplied and operated truck-mounted hollow-stem auger drill rig was used to advance the borings to the indicated depth. Field exploration activities described above were observed by an engineer or geologist from this office, who logged the underlying materials and obtain bulk and relatively undisturbed drive soil samples for laboratory analyses. Standard Penetration Testing (SPT) of the encountered in-situ earth materials was performed at various depths within exploratory boring B-8. Four Cone Penetrometer Test (CPT) Soundings were advanced to depths of approximately 50 feet bgs (CPT-2, CPT-5, CPT-8, and CPT-10) utilizing a subcontractor supplied and operated cone penetrometer test rig.

The points of exploration were marked in the field and a utility locator subcontractor was contacted to identify the surface trace of detectable underground utilities and abandoned piping in an effort to explore away from subsurface utilities. Additionally, Underground Service Alert (USA) was contacted per State mandated protocol prior to excavation on the site.

At the end of drilling, the borings were backfilled with the excavated material and/or patched with asphalt cold patch, the CPT soundings were filled with bentonite. Both the boring and CPT backfills may settle with time and a LAUSD representative should fill any depression that may occur, as necessary.

3.3 LABORATORY TESTING

A program of geotechnical laboratory testing was performed to evaluate properties of selected soil samples obtained during the subsurface exploration. The following tests were conducted for this preliminary site evaluation:

- In-situ moisture content and dry density
- Maximum density and optimum moisture content relationships
- Direct Shear Testing
- Consolidation Testing
- Expansion Index Testing
- Hydrometer Analyses
- Corrosion Testing

3.4 GEOTECHNICAL ENGINEERING ANALYSIS AND REPORT PREPARATION

This report was prepared to present the results of our archival research, field subsurface exploration and laboratory testing programs, and engineering analyses including the findings and conclusions of our preliminary geotechnical site evaluation. The report includes:

a) A description of subsurface conditions as encountered in the exploratory excavations, including Logs of Subsurface Data (Appendix A) and a Geotechnical Exploration Map (Plate 1).

b) A description of the laboratory testing program, including tests results (Appendix B).

c) Geotechnical Cross Sections (Plate 2) showing the interpreted subsurface profile.

d) Discussion and recommendations regarding:

   i) Geologic hazards including seismic setting of the site and faulting;

   ii) Seismic design criteria for new and retrofit/modernization buildings;

   iii) Seismically induced settlement;

   iv) Site preparation and remedial grading;

   v) Foundation design recommendations including shallow, mat and deep foundations including estimated settlements;

   vi) Retaining wall design parameters, including earthquake loading;

   vii) Pavement design recommendations; and

   viii) Soil chemistry analysis, by subcontract.

The scope of services for this report did not include a geotechnical evaluation of the existing structures.

4.0 SITE DESCRIPTION

Reseda High School is on a relatively flat irregularly shaped parcel bounded on the north by Kittridge Street, the east by Lindley Avenue, the south by Victory Boulevard, the southwest by the Los Angeles River Flood Control Channel, and on the west by Etiwanda Avenue (see Figure 1). Onsite, the existing buildings are generally on the northwestern portion of the campus with the southern and eastern portions consisting of modular classrooms and asphalt covered playground and grass fields. Grass and land-scaping is present on the western side of the school along Etiwanda Avenue and scattered between the buildings. The areas of our evaluation are shown on the attached Geotechnical Exploration Map, Plate 1.

5.0 REGIONAL GEOLOGIC SETTING

The Site is in the southwestern portion of the San Fernando Valley, an east trending structural trough within the Transverse Ranges geomorphic province of Southern California. This geomorphic province is dominated by active compressional tectonics (crustal shortening) and is characterized by east west tending ranges and ridges with intervening canyons and valleys. The San Fernando Valley has been filled from the sides with sediments from drainages of the San Gabriel Mountains (mainly) and Santa Susana Mountains to the north, the Santa Monica Mountains to the south, and the Simi Hills and Verdugo Mountains to the west and east, respectively. Being on the southern portion of the Valley, in the area near the thalweg of the L.A. River drainage, the Site is underlain by alluvial basin deposits (see Figure 2).

6.0 SITE GEOLOGIC UNITS

The Site is underlain by native soils referred to as alluvial deposits (Holocene) locally mantled with artificial fill, grass, and pavement. General descriptions of the pavement, artificial fill and alluvium as encountered in our exploratory borings are presented below with boring specific detail presented on the attached Logs of Subsurface Data (Appendix A).

6.1 PAVEMENTS

The pavement sections observed in the areas explored varied from 2 inches of asphaltic concrete (A.C.) over 2 inches of aggregate base overlying fill in boring B-6 to 3 and 4 inches of A.C. overlying native soils (B-11 and B-3) to 3 and 5 inches of A.C. overlying fill soils (B-8 and B-7). Boring B-9 encountered a 5 inch thick concrete slab-on-grade overlying native soils.

6.2 ARTIFICIAL FILL

Artificial fill soils were found to vary in thickness from 1½ feet to 5 feet. As observed the fill soils generally consist of mottled silty clay in a damp to moist and soft to very stiff condition. In boring B-8 the 2 feet of encountered fill soil consisted of silty fine to coarse sand with gravel in a moist and medium dense condition. Given the developed nature of the Site other areas of fill are likely to exist.

6.3 ALLUVIUM

The late Holocene alluvial soil profile consists predominantly of silty clays with thin layers of clayey to silty fine sand interstratified. The soils were moist to very moist and became saturated below groundwater. The alluvial soils varied in consistency from medium stiff to very stiff for the cohesive, clayey alluvial soils and medium dense to dense where sandy.

6.4 GROUNDWATER

Groundwater was encountered at depths of approximately 29 feet (B-1) and 33½ feet (B-8) bgs. Six other borings drilled to 31 feet did not encounter groundwater. As previously mentioned, historical high groundwater is on the order of 10 feet below the existing grade (CGS, 1997).

6.5 LANDSLIDES

No landslides are present within or near the site nor are any shown on regional geologic maps.

6.6 FLOOD HAZARD ZONE

The proposed site is not in a Federal Emergency Management Agency (FEMA) mapped flood hazard zone (FEMA FIRM Map, 2008). The site is adjacent to a flood control channel. The site is also not in a dam or tsunami inundation zone (City of Los Angeles Dept. of City Planning, website).

6.7 FAULTING AND SEISMICITY

Reseda High School, like other sites in the San Fernando Valley, is in a seismically active region prone to occasional damaging earthquakes. The destructive power of earthquakes can be grouped into fault-rupture, ground shaking (strong motion), and secondary effects of ground shaking (such as tsunami, liquefaction, settlement, landslides). The hazard of fault-rupture is generally thought to be associated with a relatively narrow zone along well-defined pre-existing active or potentially active faults. No doubt there is and will be exceptions to this, because it is not possible to predict the precise location of a new fault where none existed before (CDMG, 1975). No active faults are known to cross the Site. The Site is not currently within an Alquist-Priolo Earthquake Fault Zone as defined by the State Geologist (Bryant and Hart, 2007).

Geologic Time Scale			Years Before Present (Approx.)	Fault Symbol	Recency of Movement	DESCRIPTION	
						ON LAND	OFFSHORE
Quaternary	Late Quaternary	Historic				Displacement during historic time (e.g. San Andreas fault 1906). Includes areas of known fault creep.	
		Holocene	200			Displacement during Holocene time.	Fault offsets seafloor sediments or strata of Holocene age.
		Pleistocene	11,700			Faults showing evidence of displacement during late Quaternary time.	Fault cuts strata of Late Pleistocene age.
	Early Quaternary		700,000			Undivided Quaternary faults - most faults in this category show evidence of displacement during the last 1,600,000 years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age.	Fault cuts strata of Quaternary age.
Pre-Quaternary			1,600,000 - 4.5 billion			Faults without recognized Quaternary displacement or showing evidence of no displacement during Quaternary time. Not necessarily inactive.	Fault cuts strata of Pliocene or older age.

GORIAN & ASSOCIATES, INC.
APPLIED EARTH SCIENCES

Work Order: 2880-62-0-100		Date: June 2017
Scale:1"= 10 Miles	Drawn by:	Figure 3
	Approved by:	

The closest historically active surface fault is the San Fernando fault which ruptured February 9, 1971 and is approximately 7 miles north-northeast of the site. The active Hollywood fault, part of the Santa Monica-Hollywood-Raymond fault system lies approximately 10 miles southeast of the Site and the active Verdugo fault is approximately 11 miles east of the site (see Figure 3). The potential for ground rupture on site due to faulting during the life expectancy of the project is considered remote.

Although no active faults are known to exist within the site, the area will be subject to strong ground motion from occasional earthquakes in the region. Four significant earthquakes have occurred centered within 40 miles of the site within the last eight decades; the March 11, 1933 Long Beach earthquake (6.4 magnitude), the February 9, 1971 San Fernando earthquake (6.6 magnitude) with its epicenter about 16½ miles northeast of the Site, the October 1, 1987 Whittier Narrows earthquake (6.0 magnitude), and the January 17, 1994 Northridge earthquake (6.7 magnitude) with its epicenter 1½ miles southwest of the site.

It is estimated during the Northridge event, the general area of the school experienced maximum horizontal accelerations on the order of 0.45gon the alluvial soil site condition. This is based upon ground motion data obtained from ground motion contours presented in Chapter 3 of the *Preliminary Report on the Principal Geotechnical Aspects of the January 17, 1994 Northridge Earthquake* (Chang et al., 1994). Significant earthquakes will likely occur in this area within the life expectancy of the project and the site will experience strong ground shaking from these events.

Based on the latest U.S. Geological Survey (USGS) interactive web application, *Unified Hazard Tool* <https://earthquake.usgs.gov/hazards/interactive/> probabilistic seismic hazard analyses (PSHA) predict the Design Basis Earthquake (475-year return period) peak horizontal ground acceleration will be on the order of 0.62g for the alluvial soil conditions of the Site D (assumed V_S=259 m/sec). The mean magnitude from this PSHA is 6.54(Mw) with a mean distance of 14.88 km from the property. Utilizing a 2% probability of exceedance in 50 years (2,475-year return period) the peak ground acceleration is estimated to be 1.10g based on a seismic event with a mean magnitude of 6.67(Mw) at a mean distance of 12.85 km.

Additional seismic data is presented in later sections and in Appendix C. Secondary effects of strong ground motion include Tsunami, seiche, liquefaction, settlement, landslides, etc. Tsunami (seismic sea wave and seiche (standing wave) are not hazards inherent to the site due to its distant proximity to the ocean and large bodies of water. Likewise, seismically induced landsliding is not a hazard inherent to the relatively flat Site. Earthquake induced liquefaction and seismic settlement affecting the proposed site development are discussed below.

6.8 LIQUEFACTION POTENTIAL

Liquefaction is a seismic phenomenon in which saturated cohesionless soils (sands) lose strength when severely shaken and develop excess pore pressures. As stated in the CDMG (1997) report, “In order to be susceptible to liquefaction, potentially liquefiable soils should be saturated or nearly saturated. In general, liquefaction hazards are most severe in the upper 50 feet of the surface…”

The Site is in an area zoned by the State as being susceptible to liquefaction (CGS, 1998). Seismically induced settlement was evaluated using data obtained from both borings and CPTs (cone penetration tests). The computer program GeoSuite by GeoAdvanced™ was used for the liquefaction and dry sand settlement analyses. For liquefaction/seismic settlement evaluations the 2016 CBC / ASCE 7-10 designates a ground motion with a 2% chance of being exceeded in 50 years (2475 return period) be utilized. The mean magnitude from this PSHA is 6.67 (Mw) with a mean distance of 12.85 km from the property. The modal magnitude from this analysis is 6.31 (Mw) and the modal distance is 11.17 km from the prop-

erty. The peak ground acceleration in accordance with Section 11.8.3 of ASCE 7 is 0.645g. These parameters were utilized in our seismically induced settlement analyses and yielded seismically induced settlement of on the order of 1 to 3 inches in the CPT Soundings and 2½ inches in the boring (B-8), see Appendix C. Differential seismic settlement is typically anticipated to be one-half of the total seismic settlement. Based on the estimated seismic settlement, the estimated differential seismic settlement will be on the order of ¾ to 1½ inches.

Potential lateral spread was calculated using Youd, Hansen and Bartlett for the CPT closest to the Los Angeles County Flood Control Channel. The channel was assumed to be 15 feet deep. CPT-10, when subjected to the 2,475-year return period event yielded lateral spread of 1½ inches.

6.9 CORRELATION CPT AND BORING

Boring B-8 and CPT-8 were excavated in the same general area. The subsurface profiles consisted mainly of clay soils with occasional thin sand lenses. The CPT identified sand layers from 1½-2½, 17-17½, 32-33 and at 50 feet bgs. The boring encountered sand layers from ¼-2, 15½-18½, 28½-29½, 30½-32, 44-47, and at 50 feet bgs. The calculated seismic settlement was higher for the boring, 2.4 inches vs 1.3 inches for the adjacent CPT. This is likely due to the thicker sand layers in the boring as a result of the discrete rather than continuous sampling intervals. Also, the boring identified more sand layers than the CPT; and the sand layers in the boring may have been more cohesive than reported. Furthermore, the analyses of the boring used blow counts obtained from both SPT and ring samples.

6.10 HYDRO-COLLAPSE

Based on consolidation testing of the underlying soils, the cohesive and expansive nature of the preponderance of the soils, the potential for hydro-collapse of the underlying soils is low.

7.0 GEOTECHNICAL CONCLUSIONS AND RECOMMENDATIONS

From a geotechnical standpoint, our preliminary geotechnical hazards evaluation for the proposed project has found that with proper design and construction practices, the Site is suitable for future development/modernization. We understand the project is in the very early stages and no design information is available at this time. Presented below are preliminary design information which may help determine the extent of the modernization project.

7.1 SOIL EXPANSIVENESS

Soil expansion tests were performed on representative soil samples obtained from the site. Test results indicate the underlying materials have a low to medium expansion potential, in the 21-90 expansion index range.

7.2 SOIL CORROSIVITY

Two samples of on-site soils were obtained and sent to Atlantic Consultants for soil chemistry analyses. The results, attached in Appendix B, indicate the corrosion class of concrete in contact with the onsite soils is negligible to severe for sulfate exposure and negligible for chloride exposure. Further, the onsite soils are moderately corrosive to corrosive to ferrous metals and corrosive to copper piping.

7.3 GEOTECHNICAL SEISMIC DESIGN

The site may experience strong ground shaking from seismic events generated on regionally active faults. Seismic ground motion parameters were evaluated using a simplified code based approach and ground motion procedures for seismic design. The simplified code based approach follows the procedures in the 2016 California Building Code (CBC) based on ASCE/SEI 7-10 Section 11.4. Retrofit values were obtained from ASCE 41-13 using the standard of BSE-1E.

Seismic ground motion values are initially determined based on site class B (rock) conditions. The values are adjusted to obtain the maximum considered earthquake (MCE) spectral acceleration values for the site based on its site class of D. The seismic design parameters for the site's coordinates (latitude 34.18943° North and longitude 118.53011° West) were obtained from the USGS web based spectral acceleration response maps and calculator:
<http://earthquake.usgs.gov/designmaps/us/application.php>

Seismic Parameters based on ASCE/SEI 7-10

CHAPTER 16 TABLE/FIGURE NO.	SEISMIC PARAMETER	VALUE PER CA BUILDING CODE
Figure 1613.5 (3)	Short Period Mapped Acceleration (S_s)	1.760g

Table 1613.5.2	Site Class Definition	D
Table 1613.5.3 (1)	Site Coefficient (F_a)	1.0
Table 1613.5.3 (2)	Site Coefficient (F_v)	1.5
Equation 16-37	$S_{MS} = F_aS_s$	1.760g
Equation 16-38	$S_{M1} = F_vS_1$	0.930g
Equation 16-39	$S_{DS} = 2/3S_{MS}$	1.173g
Equation 16-40	$S_{D1} = 2/3S_{M1}$	0.620g

Seismic Parameters based on ASCE 41-13 Retrofit Standard, BSE-1E

Section	SEISMIC PARAMETER	VALUE
2.4.1.4	$S_{S,20/50}$	0.813g
2.4.1.4	$S_{1,20/50}$	0.291g
2.4.1.6.1	Site Class Definition	D
Table 2-3	F_a	1.175
Table 2-4	F_v	1.819
Equation 2-4	$S_{XS,BSE-1E}$	0.955g
Equation 2-5	$S_{X1,BSE-1E}$	0.529g

The purpose of the building code earthquake provisions is primarily to safeguard against major structural failures and loss of life, not to limit damage nor maintain function. Therefore, values provided in the building code should be considered minimum design values and should be used with the understanding site acceleration could be higher than addressed by code based parameters. Cracking of walls and possible structural damage should be anticipated in a significant seismic event.

7.4 SITE PREPARATION

Areas of new construction will require site preparation prior to foundation excavation or slab subgrade preparation. The following preliminary site preparation and grading recommendations are for the preparation of areas for construction of new buildings, retrofit buildings and other exterior site improvements.

These recommendations should be reviewed when plans are available for the proposed modernization of the school. Footing locations and dimensions of the existing structures are unknown; therefore, care should be taken to protect the foundations and their supporting soils at all times. The presence of the existing buildings should be considered during all design and construction activities. All aspects of grading including site preparation, grading, and fill placement should be per the applicable Building Code.

7.4.1 Site Cleanup

Existing paving, debris, structures, etc. that are not a part of the final product should be removed from the proposed construction area. Debris generated from the demolition should be hauled away. The exposed ground surface should be observed and tested by a field representative of this office to evaluate the consistency and similarity of the soils which will provide support to the proposed construction.

7.4.2 Soil Removals

Below new buildings and 5 horizontal feet beyond, non-engineered fill soils where encountered should be removed to firm in-place native soils. In addition, within the footprint of the structures and to a minimum distance of five feet beyond, at least three feet of newly compacted soils should be provided below shallow foundations. Where deep foundations (piles) are proposed, existing fill should be removed where encountered and a minimum of two feet of newly compacted fill soils should be provided for slab support.

In areas of paving, a minimum of two feet of newly compacted fill should be provided. Existing fill soils, where encountered, should be evaluated prior to placing new fill soils.

Due to possible variations in the subsurface materials, local areas of deeper removals may be necessary. After these removals are completed as addressed above, the exposed ground surface should be observed by a field representative of this office to evaluate if it is suitable for placement of certified fill. No fill soils may be placed until completion of the geotechnical observation.

Removals adjacent existing structure footings should not extend below a 2(horizontal):1(vertical) line extending down from the top of the footing or may need to be performed in slots to protect the existing foundations. Removal bottoms should be observed by a representative of this office. In addition, removals adjacent existing footings should be observed by a representative of this office as the removals are made.

Soil removal within existing buildings to be improved should be based on observations by a representative of this office of the existing soil conditions after being exposed by the general contractor. At this time, no significant soil removals are anticipated within existing buildings to be improved.

If soil removals are necessary within an existing building, removals within areas to receive fill or to provide support for the structure should expose competent materials. Removals adjacent existing structure footings should not extend below a 2(horizontal):1(vertical) line extending down from the top of the footing or may need to be performed in slots to protect the existing foundations. Removal bottoms should be observed by a representative of this office. In addition, removals adjacent footings should be observed by a representative of this office as the removals are made.

7.4.3 In-Place Soil Processing

Following removals, the underlying 8 to 12 inches should be scarified, moisture conditioned to above the optimum moisture content, and recompacted to at least 90% relative compaction.

7.4.4 Fill Placement

On-site soils may be reused as fill soils providing the soils are free of major vegetation, trash and debris. Per the applicable building code, rocks greater than 6 inches in diameter (or smallest dimension) should be excluded from all fills placed. Suitable fill soils should be placed in thin (6 to 8 inch maximum) lifts, brought to above optimum moisture content, and compacted to at least 90% relative compaction.

7.4.5 Relative Compaction
Relative Compaction is the ratio of in-place dry soil density to the maximum dry soil density determined in general conformance with ASTM test method D 1557.

7.4.6 Temporary Excavations
During construction, the contractor is responsible for the excavation and maintenance of safe and stable slope angles considering the subsurface conditions and the methods of operations. Temporary excavations should be made per the applicable requirements of the current Cal/OSHA excavation regulations. Geotechnical evaluation of temporary excavations can be provided when the excavation location is known.

7.5 SHALLOW FOUNDATION DESIGN
Geotechnical recommendations for conventional foundation systems are presented below based on soils with a medium expansion potential (51-90 expansion index range).

7.5.1 Conventional Footings
Continuous and isolated footings may be designed to impose an allowable bearing pressure of 1,500 pounds per square foot (psf). These bearing pressures apply for dead plus live loads and may be increased by one-third when considering wind or seismic loads.

Continuous and isolated footings should have minimum widths of 12 and 18 inches, respectively. The footings should be embedded a minimum of 24 inches. Embedment of exterior footings should be measured from the lowest adjacent exterior grade. Interior footings may be measured from the top of slab. Bearing values may be increased by 250 psf for each additional foot of depth above the minimum and 100 psf for each additional foot of width to a maximum of 3,000 psf. After excavation, footing bottoms should be observed by a representative of this office to evaluate if additional soil removal or recompaction is warranted.

Steel reinforcement should be per the structural engineer's recommendations; however, minimum continuous footing reinforcement should consist of two number 4 bars in the top and bottom (total of 4 bars).

7.5.2 Conventional Footings - Retrofit
The seismic retrofit may be supported on continuous and isolated footings founded in suitable existing fill soils or competent native soils and should be a minimum of 12 and 24 inches wide, respectively. The footings may be designed to impose an allowable soil bearing pressure of 1,800 psf provided they are a minimum of 24 inches below the lowest adjacent grade. The above net allowable bearing capacity may be increased by one-third for short-term wind and seismic loads.

The embedment should be a minimum of 24 inches for perimeter and interior footings, or re-evaluated to match the existing footings. The lowest adjacent grade is the lowest soil grade adjacent the footings, interior or exterior. After excavation, footing bottoms should be compacted. Interior footings may be measured from the top of slab.

Steel reinforcement should be per the structural engineer's recommendations. However, minimum reinforcement for continuous footings should consist of one #4 bar in the top and bottom (minimum total of two bars).

7.5.3 New Footing Surcharge on Existing Adjacent Footings
Where new footings are utilized for the seismic retrofit, the footings should be founded at the same depth as the existing footings. Because of the influence of the new applied load, new footings will add vertical stress to the soils underlying the existing adjacent footings. For continuous wall footings and for square

pad footings, approximately 20% and 10% of the wall or square footing load in psf, respectively, will be distributed under the adjacent existing wall footing. The resulting settlement can be calculated once footing sizes and loads along with the location of the new footings relative to existing footings are known.

The soil stresses from existing footings should not have an effect on adjacent new footing settlement since stresses from the existing footings are already applied and settlement has already occurred.

7.5.4 Resistance to Lateral Loads

Lateral forces on foundations in fill soils may be resisted by passive earth pressure and base friction. Lateral passive earth pressure may be considered equal to a fluid weighing 250 pounds per cubic foot (pcf) where the footing is on level ground. Base friction may be computed at 0.25 times the normal load. These values have a factor of safety of 1.5 and may be combined without reduction.

7.5.5 Foundation Settlement

Settlements of new shallow footings due to static loading are anticipated to be minor with settlement on the order of ½ to 1-inch. This should be confirmed when the actual foundation loads become available. Differential settlements between adjacent columns with similar static loading are anticipated to be on the order of one half the total settlements. Differential settlement between new and existing foundations should be evaluated when the actual foundation locations and loads become available.

The potential for seismic induced settlement due to liquefaction have been previously discussed in this report. Seismic induced movements are in addition to the potential for static settlement.

All structures settle during construction and minor structure settlement can occur after construction during the life of the project. Minor wall or slab cracking may also be associated with settlement or expansive soil movement. Wall cracking can also occur associated with expansion and contraction of structural wood members due to thermal or moisture changes. Settlement or soil movement could occur if the soils become saturated due to excessive water infiltration generally caused by excessive irrigation, poor drainage, etc.

7.5.6 Footing Excavations

All footings should be cut square and level and cleaned of slough and soils silted into the excavations. A representative of this office should observe the footing excavations prior to placing reinforcing steel. The footings should be cast as soon as possible to avoid deep desiccation of the footing subsoils. Soil excavated from the footing trenches should not be spread over areas of construction unless properly compacted.

7.5.7 Slabs-On-Grade

The concrete slabs-on-grade within the building interiors should be a minimum of 4 inches thick and underlain by a minimum of 4 inches of aggregate as required by the applicable building code. Reinforcement should consist of a minimum of No. 4 bars at 18 inches on centers in both directions or per the structural engineer's design. The slab steel reinforcement should be extended into the foundations to within 3 inches of the footing bottom at 36 inches on center.

7.5.8 Concrete Placement and Cracking

Minor cracking of concrete slabs is common and is generally the result of concrete shrinkage continuing after construction. Concrete shrinks as it cures resulting in shrinkage tension within the concrete mass. Since concrete is weak in tension, development of tension results in cracks within the concrete. Concrete should be placed using procedures to minimize the cracking within the slab. Shrinkage cracks can become excessive if water is added to the concrete above the allowable limit and proper finishing and curing practices are not followed. Concrete mixing, placement, finishing, and curing should be performed

per the American Concrete Institute Guide for Concrete Floor and Slab Construction (ACI 302.1R). Concrete slump during placement should not exceed the design slump specified by the structural engineer. Where shrinkage cracks would be unsightly, concrete slabs on grade including post-tensioned slabs should be provided with tooled crack control joints at 10-15 foot centers or as specified by the structural engineer.

7.5.9 Under-Slab Treatment

Where moisture sensitive floor coverings will be utilized, an appropriate moisture vapor retarder layer should be installed and maintained below the concrete slabs to reduce moisture vapor transmission through the slab. Ten-mil plastic sheeting is commonly used as a moisture vapor retarder layer. If a higher degree of moisture retarder is warranted, a retarder in general accordance with ASTM E 1745-97 *Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs* should be considered below the interior concrete slabs on-grade installed per ASTM E1643-98(2005) *Standard Practice for Installation of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs*.

Perforations through the moisture vapor retarder such as at pipes, conduits, columns, grade beams, and wall footing penetrations should be sealed per the manufacturer's specifications or ASTM E1643-98(2005) *Standard Practice for Installation of Water Vapor Retarders Used in Contact with Earth or Granular Fill under Concrete Slabs*. Proper construction practices should be followed during construction of the slab on-grade. Repair and seal tears or punctures in the moisture barrier that may result from the construction process prior to concrete placement.

Minimizing shrinkage cracks in the slab-on-grade can further minimize moisture vapor emissions. A properly cured slab utilizing low-slump concrete will reduce the risk of shrinkage cracks in the slab as described herein.

The concrete contractor should be made aware of the moisture vapor retarder and required to protect the layer. Perforations made in the layer by the concrete contractor should be properly sealed prior to concrete placement. In addition, if the concrete is placed directly on top of the layer the concrete contractor should make the necessary changes in the concrete placement and curing. Placing the concrete directly on top of the moisture vapor retarder layer allows the layer to be observed for damage directly prior to concrete placement.

The slabs should be tested for moisture content prior to the selection of the flooring and adhesives. Moisture in the slabs should not exceed the flooring manufacturer's specifications. The concrete surface should be sealed per the manufacturer's specifications if the moisture readings are excessive.

Where cuts are made into the slab for future construction, the moisture vapor retarder layer should be repaired per the manufacturer's recommendation. Information regarding the need to repair the moisture vapor retarder layer and information on the selection of acceptable floor coverings should be conveyed to the school district personnel.

7.5.10 Moisture Penetration

Conventional footings and reinforced slab-on-grade subgrade soils should be premoistened to 3% over the optimum moisture content for a depth of 18 inches. However, the subgrade soils should not be flooded or soaked creating a saturated condition. A representative of this office should observe the subgrade soil premoistening prior to casting the concrete. Soils silted into the footing excavations during the premoistening operations should be removed prior to casting the concrete.

7.6 FLAG POLE FOOTING RECOMMENDATIONS

New, remodeled or retrofit structures may be supported by flagpole footings. These footings (piles) may be designed using an allowable lateral bearing pressure of 250 psf per foot of depth for level ground (maximum pressure should not exceed 2,500 psf). This value has a factor of safety of 1.5. If deflection of pole foundations is a concern, deflection calculations can be provided when loads are known.

7.6.1 Pile Construction

Due to layers of sand, some caving or raveling should be anticipated during the pile construction. The drilling contractor should be prepared to use casing in areas where excessive caving occurs.

Groundwater was encountered in our exploratory borings at depths ranging from 29 feet to 33½ feet below ground surface. It is unlikely that water will be encountered during drilling, if piles are shorter than about 29 feet. To minimize caving potential, piles should be filled with concrete in a timely manner and not left open overnight.

Where piles are installed below groundwater, the drilling contractor should be prepared to use casing and/or drilling mud. Where concrete is placed below groundwater, it will be necessary to use a tremie pipe that extends to the bottom of the pile. While placing the concrete, the tremie pipe must be maintained below the top of the concrete while below the water table. Where casing is required, a sufficient head of concrete must be maintained inside the casing while the casing is pulled in order to maintain stability of the hole. Due to the complexity of constructing concrete piles below the groundwater table, this procedure should be carefully controlled and monitored. To minimize caving potential, we recommend that the piles which encounter groundwater should be drilled and cast in the same day.

Care should be exercised when casting adjacent piles to avoid blowout from one excavation into the other. From an engineering standpoint, the preferred method would be to excavate, cast, and let the concrete achieve initial set prior to excavating the adjacent pile. However, where spacing between adjacent piles is greater than three times the largest pile diameter, satisfactory results have been achieved by casting adjacent piles simultaneously, keeping the differential elevation of the concrete less than five feet between piles.

Pile excavations should be observed by the project geotechnical consultant prior to setting reinforcing steel to verify the anticipated geotechnical conditions or to evaluate any unanticipated conditions encountered.

7.7 RETAINING WALLS

7.7.1 General

Retaining walls may be designed using the foundation recommendations previously provided herein.

7.7.2 Lateral Earth Pressures

Retaining walls that are backfilled with granular soils having a low expansion potential (Expansion Index less than 50) and allowed to yield at the top may be designed for an active pressure of 40 and 60 pounds per cubic foot for a level and 2(horizontal):1(vertical) slope backfill condition, respectively. Aerial surcharge may be treated as additional height of backfill where one foot of additional height is assumed for each 125 psf of aerial surcharge.

7.7.3 Lateral Seismic Pressure

Lateral seismic soil pressure is not required for retaining walls under 6 feet high. Walls over 6 feet high should be designed for seismic pressure of 17 pounds per cubic foot taken as an inverted triangle.

7.7.4 Waterproofing
Retaining walls should be waterproofed prior to installing the drainage system and wall backfill.

7.7.5 Drainage
A drainage system should be constructed behind retaining walls over two feet high to mitigate possible buildup of hydrostatic pressures. The drainage system may consist of either a drainage composite or granular drain consisting of a minimum 12 inch wide zone of 3/4 ± inch rock separated from the native materials by a single layer of filter cloth. The drainage system should extend to within 2 feet of finish grade with the upper 2 feet backfilled with native material. The drainage system should be hydraulically connected to a perimeter pipe drain consisting of a minimum 4 inch diameter perforated PVC (Schedule 40) pipe or equivalent. The pipe may be laid horizontally on the footing with the pipe invert at least 6 inches below any adjacent top of slab-on-grade. The outlet pipe from the perimeter drain should be a non-perforated 4 inch diameter PVC (Schedule 40) pipe that is sloped to and connected to a storm drain system or sump. An as-built plan should be prepared detailing the location of the wall drainage system.

7.7.6 Backfilling
Retaining walls should be backfilled when possible with soils having a soil expansion of less than 50, which may require select grading or import. The backfill should be placed in 6-inch lifts at slightly over optimum moisture content and compacted to at least 90 percent relative compaction. If the backcut is flatter than ½(horizontal):1(vertical), the backfill should be benched into the backcut slope. Light equipment should be used immediately behind the walls to prevent possible over-stressing.

7.8 EXTERIOR SLABS AND WALKWAYS
All exterior concrete slabs-on-grade and walkways should be a minimum of 4 inches thick and underlain by a minimum of 4 inches of sand. Exterior slabs should be reinforced with a minimum of #3 bars on 24 inch centers in each direction. All slabs should have crack control joints (full depth joints) at intervals of 10 to 15 feet. Sidewalks may consist of unreinforced concrete provided the walks are provided with crack control joints at spacing equal to the walk width.

Concrete subgrade soils should be properly placed and compacted for the support of the concrete flat-work. Prior to placing concrete, the subgrade soils should be premoistened to a minimum of 3% over the optimum moisture content for a minimum depth of 12 inches. Proper premoistening can reduce the risk of slab subgrade expansion, if used in addition to other preventive measures. The subgrade soil premoistening should be observed by this office prior to placing the concrete.

7.9 PRELIMINARY PAVING SECTION

7.9.1 Structural Section
Structural sections consisting of asphaltic concrete (AC) placed over a compacted layer of aggregate base are provided in the table below based on an assumed R value for the subgrade soils of 5. The asphalt and base should be properly placed and compacted to a minimum of 95% relative compaction. The project civil engineer should determine the appropriate traffic index for the pavement area. If buses will be using any of the drive areas a higher traffic index and thicker pavement section should be consid-ered.

Asphalt pavements should be maintained by filling cracks that appear and with periodic application of fog sealers to replace surface oils that are lost due to weathering and wear.

PRELIMINARY PAVEMENT SECTIONS	
Traffic Index	Assumed "R" Value = 5
4.0 playground	3" AC / 7" AB
5.0	3" AC / 10" AB
6.0 light automobile traffic	3" AC / 14" AB or 4" AC / 12"
AC = Asphaltic Concrete AB = Aggregate Base	

7.9.2 Subgrade Preparation
The subgrade soils within areas of proposed paving should be moistened to slightly above the optimum moisture content and compacted to at least 90% of the laboratory standard prior to placing aggregate base.

7.9.3 Aggregate Base Preparation
The aggregate base materials should be moistened to slightly above the optimum moisture content and compacted to at least 95% of the laboratory standard prior to placing concrete.

7.10 SITE DRAINAGE
Positive drainage should be consistently provided and maintained away from structures during and after construction per the grading plan or applicable building codes. In addition, drainage should not be changed creating an adverse drainage condition.

Water should not be allowed to gather or pond against foundations or hardscape allowing water migration into the subgrade. Therefore, landscape watering should be held to a minimum and irrigation systems maintained in good repair. Sprinkler or plumbing leaks should be immediately repaired. Trees should be spaced so that roots will not extend under foundations or slabs. Planters near a structure should be constructed so that irrigation water will not saturate footing and slab subgrade soils.

7.11 PLAN REVIEW
This office should review the building location, grading plans, foundation plans and specifications prior to starting construction to review conformance to recommendations in this report. Additional analysis and recommendations may be necessary based on this plan review.

This office should review the building location, grading plans, foundation plans and specifications prior to starting construction to review conformance to recommendations in this report. Additional geotechnical site evaluation may be necessary when plans are available for the modernization project. Additional analysis and recommendations may be necessary based for the plan review.

8.0 CLOSURE
This report was prepared under the direction of a registered geotechnical engineer and certified engineering geologist. No warranty, expressed or implied, is made as to conclusions and professional advice included in this report. Gorian and Associates, Inc. disclaims any and all responsibility and liability for problems that may occur if the recommendations presented in this report are not followed.

This report was prepared for Los Angeles Unified School District and their design consultants solely for the design and construction of the development described herein. This report may not contain sufficient information for other uses or the purposes of other parties. The recommendations are based on interpretations of the subsurface conditions concluded from information gained from subsurface explorations and a surficial site reconnaissance. The interpretations may differ from actual subsurface conditions, which can vary horizontally and vertically across the site. Due to possible subsurface

variations, a representative of this office should observe all aspects of field construction addressed in this report. Anyone using this report for bidding or construction purposes should perform such independent investigations as they deem necessary.

The scope of the services provided by Gorian and Associates, Inc. and its staff, excludes responsibility and/or liability for work conducted by others. Such work includes, but is not limited to, means and methods of work performance, quality control of the work, superintendence, sequencing of construction and safety in, on, or about the jobsite.

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

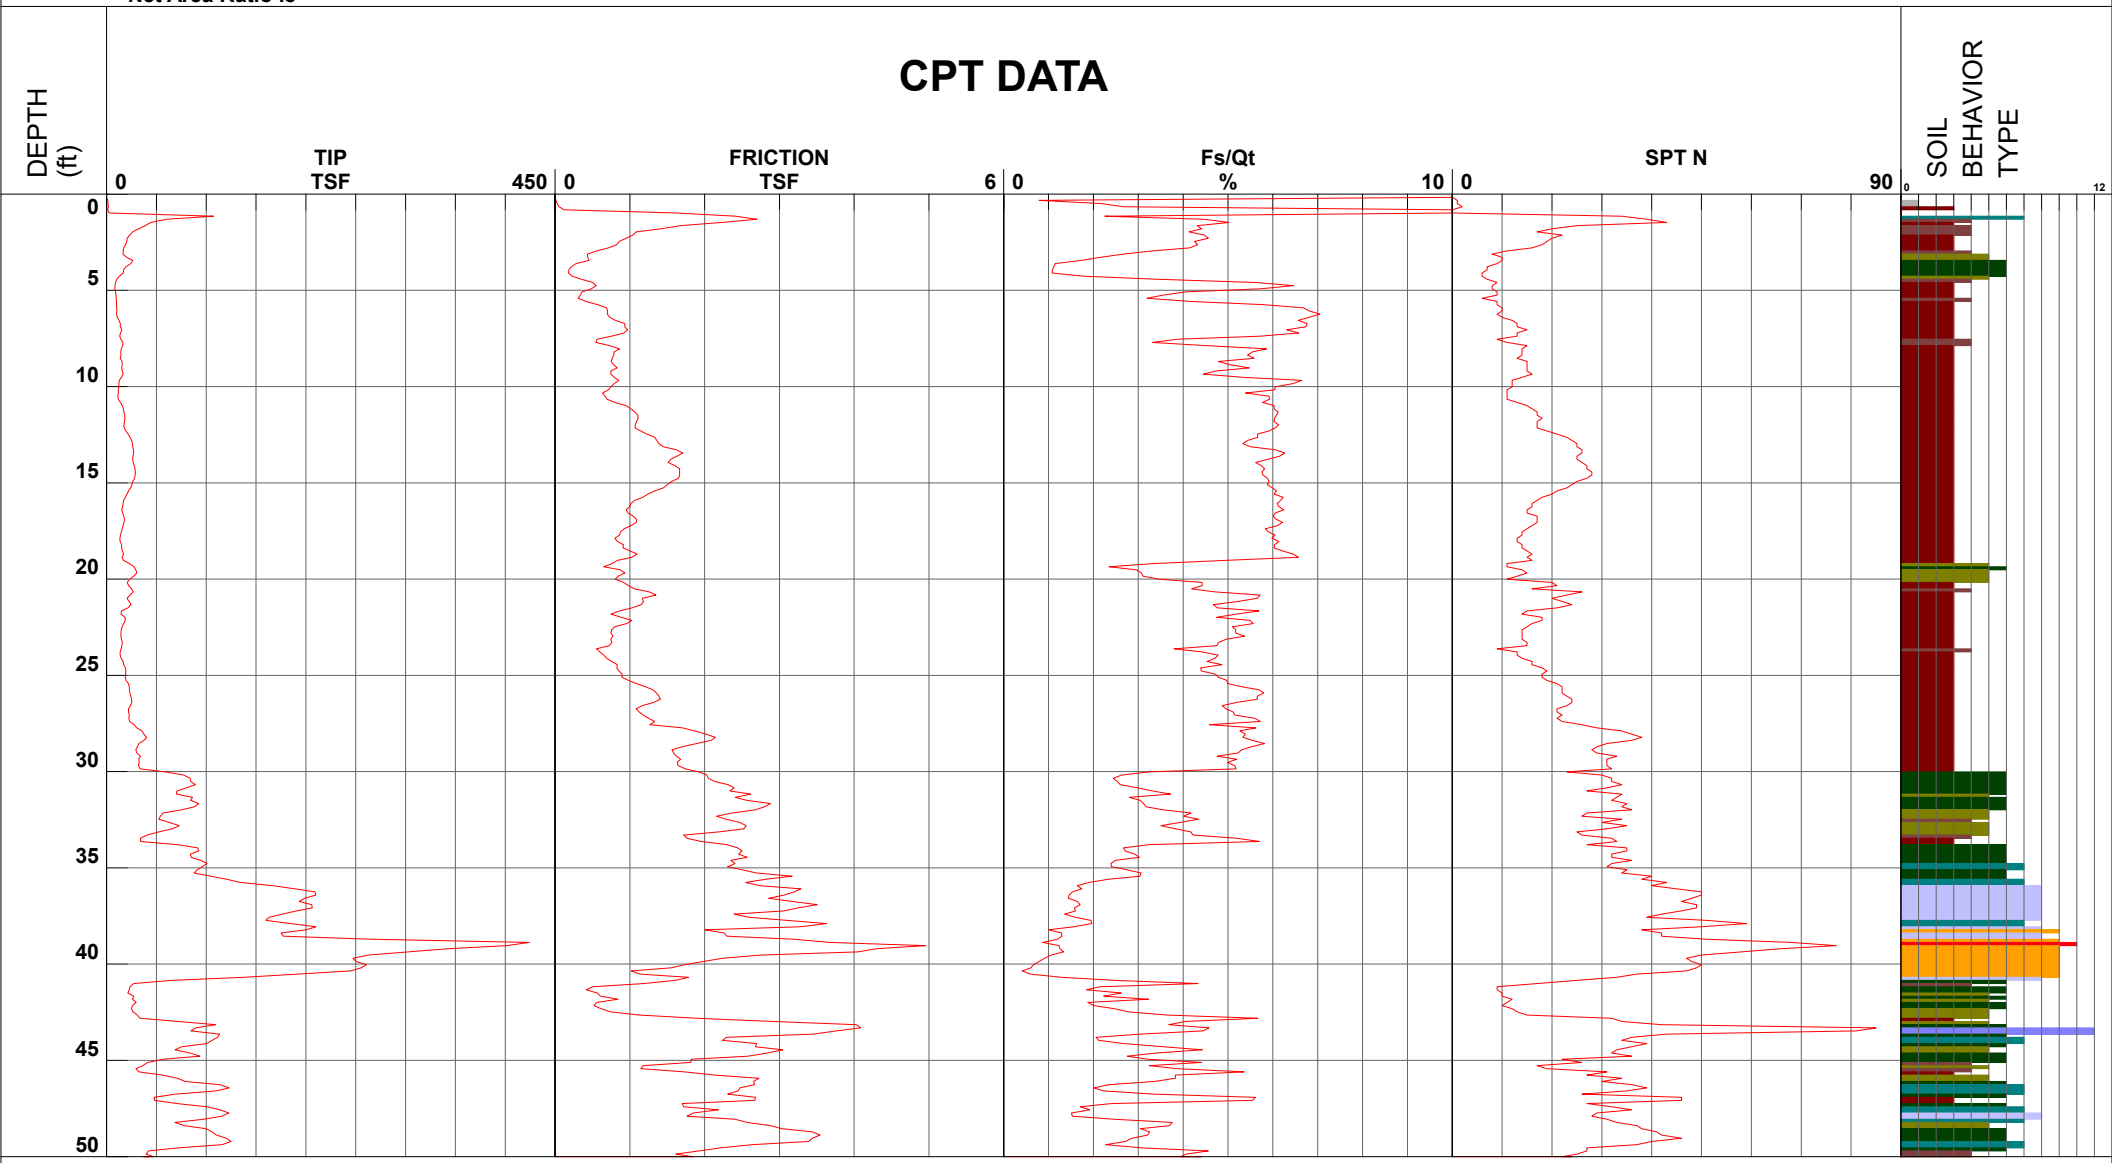
Middle Earth Geo Testing

Gorian & Associates

Project	Reseda High School	Operator	RC-JM	Filename	SDF(709).cpt
Job Number	2880-62-0-100	Cone Number	DDG1350	GPS	
Hole Number	CPT-05	Date and Time	4/12/2017 7:09:57 AM	Maximum Depth	50.52 ft
EST GW Depth During Test		31.00 ft			

Net Area Ratio .8

CPT DATA



1 - sensitive fine grained
2 - organic material
3 - clay
4 - silty clay to clay
5 - clayey silt to silty clay
6 - sandy silt to clayey silt
7 - silty sand to sandy silt
8 - sand to silty sand
9 - sand
10 - gravelly sand to sand
11 - very stiff fine grained (*)
12 - sand to clayey sand (*)

Cone Size 10cm squared

S*Soil behavior type and SPT based on data from UBC-1983

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Project ID: Gorian & Associates
Data File: SDF(709).cpt
CPT Date: 4/12/2017 7:09:57 AM
GW During Test: 31 ft

Sounding ID: CPT-05
Project No: 2880-62-0-100

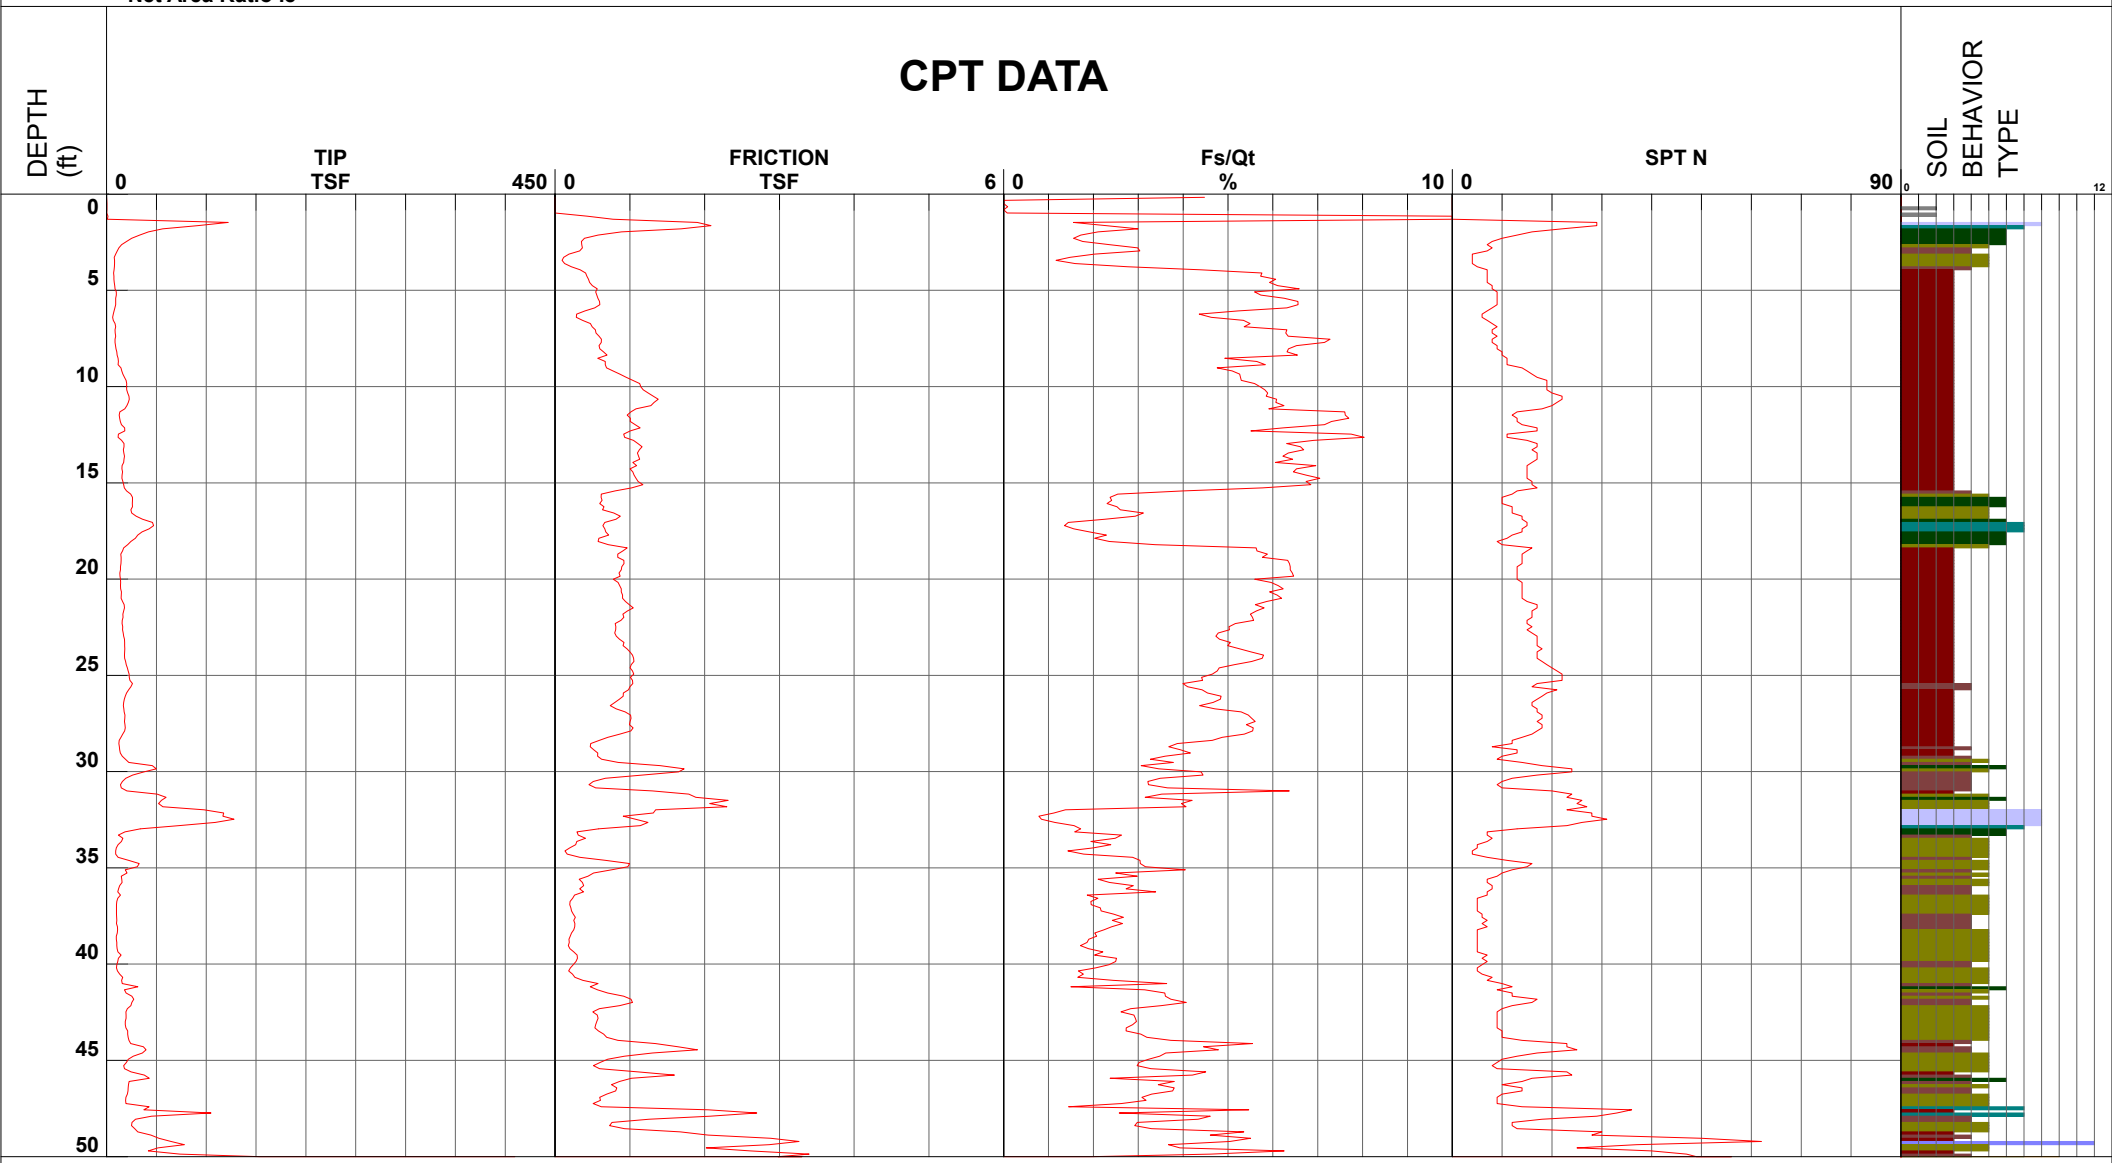
Job Number	2880-62-0-100	Cone Number	DDG1350	GPS	
Hole Number	CPT-08	Date and Time	4/12/2017 10:29:41 AM	Maximum Depth	50.52 ft
EST GW Depth During Test		31.30 ft			

Net Area Ratio .8

CPT DATA



1 - sensitive fine grained
2 - organic material
3 - clay
4 - silty clay to clay
5 - clayey silt to silty clay
6 - sandy silt to clayey silt
7 - silty sand to sandy silt
8 - sand to silty sand
9 - sand
10 - gravelly sand to sand
11 - very stiff fine grained (*)
12 - sand to clayey sand (*)

Cone Size 10cm squared

S*Soil behavior type and SPT based on data from UBC-1983

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

Reseda High School

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Reseda High School

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

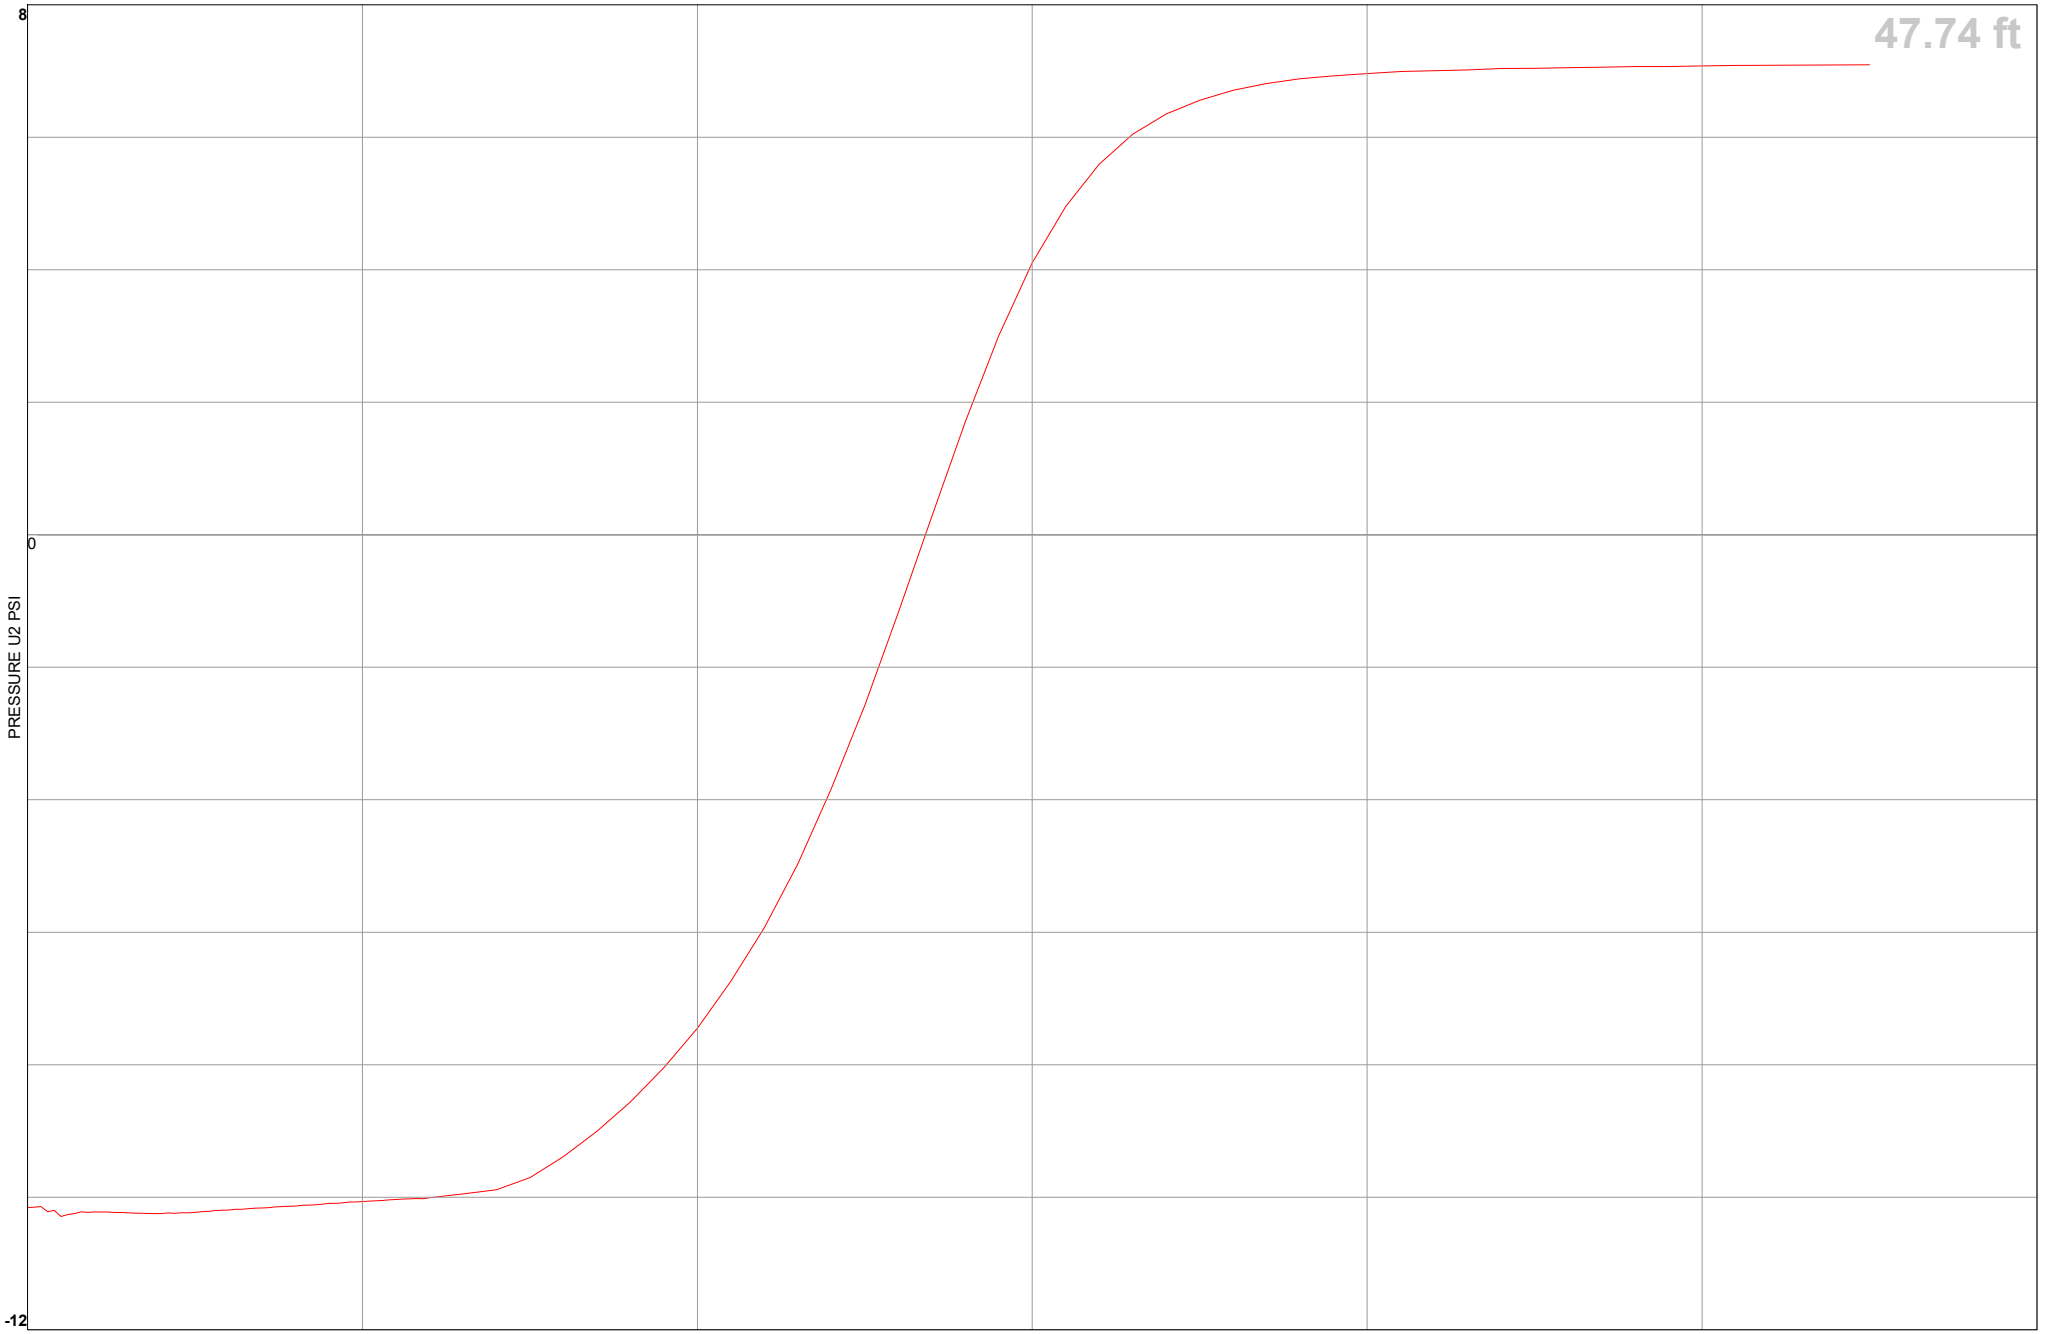
* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Gorian & Associates

Location	Reseda High School	Operator	RC-JM	GPS
Job Number	2880-62-0-100	Cone Number	DDG1350	
Hole Number	CPT-08	Date and Time	4/12/2017 10:29:41 AM	
Equilized Pressure	7.1	EST GW Depth During Test	31.3	

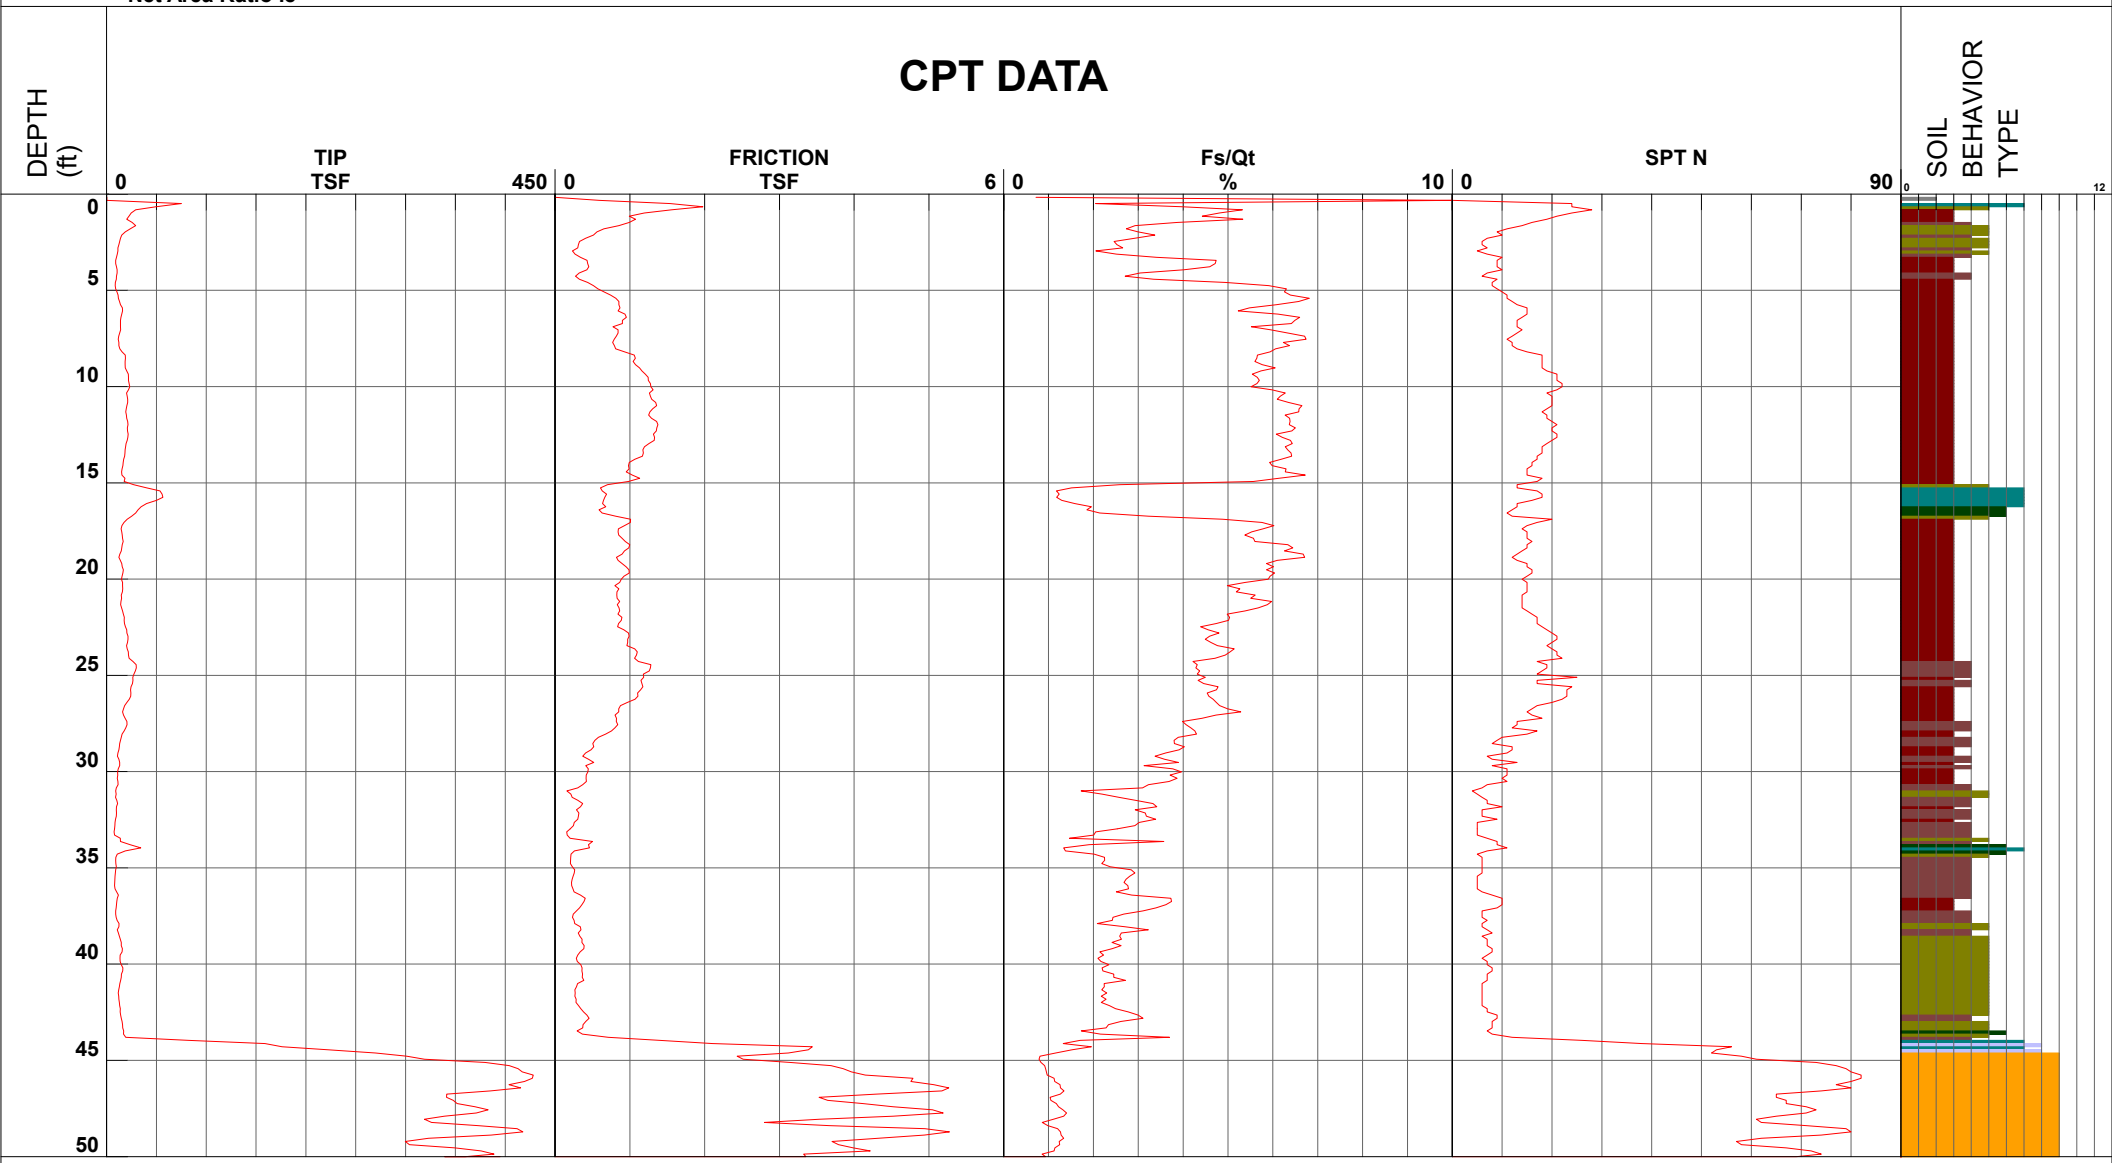


Gorian & Associates

Project	Reseda High School	Operator	RC-JM	Filename	SDF(710).cpt
Job Number	2880-62-0-100	Cone Number	DDG1350	GPS	
Hole Number	CPT-10	Date and Time	4/12/2017 7:55:05 AM	Maximum Depth	50.52 ft
EST GW Depth During Test		31.00 ft			

Net Area Ratio .8

CPT DATA



1 - sensitive fine grained
2 - organic material
3 - clay
4 - silty clay to clay
5 - clayey silt to silty clay
6 - sandy silt to clayey silt
7 - silty sand to sandy silt
8 - sand to silty sand
9 - sand
10 - gravelly sand to sand
11 - very stiff fine grained (*)
12 - sand to clayey sand (*)

Cone Size 10cm squared

S*Soil behavior type and SPT based on data from UBC-1983

Reseda High School

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

Reseda High School

Project ID: Gorian & Associates
Data File: SDF(710).cpt
CPT Date: 4/12/2017 7:55:05 AM
GW During Test: 31 ft

Sounding ID: CPT-10
Project No: 2880-62-0-100
Cone/Rig: DDG1350

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Reseda High School

Project ID: Gorian & Associates
Data File: SDF(710).cpt
CPT Date: 4/12/2017 7:55:05 AM
GW During Test: 31 ft

Sounding ID: CPT-10
Project No: 2880-62-0-100

The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

APPENDIX B
LABORATORY TESTING

General
Laboratory test results on selected samples are presented below. Test were performed to evaluate the physical and engineering properties of the encountered earth materials, including in-situ moisture and dry density, compaction characteristics, expansion potential, consolidation characteristics, grain size distribution, Atterberg limits, and shear strength parameters. Soil corrosivity testing was performed under subcontract by a corrosion engineer.

Field Density and Moisture Tests
In-situ dry density and moisture content were determined from the relatively undisturbed drive samples obtained during exploratory operations. The test results and a detailed description of the earth materials encountered are shown on the attached Logs of Subsurface Data, Appendix A.

Soil Expansion Test
Expansion Index tests were performed on selected bulk samples of the encountered materials. The results are as follows:

Sample	Expansion Index	Expansion Index Range	Expansion Potential
B-1 @ 1’	22	21 - 50	Low
B-6 @ 1’	54	51 - 90	Medium

Optimum Moisture-Maximum Density Curve
Maximum density/optimum moisture tests (compaction characteristics) were performed on selected bulk samples of the encountered materials. The results are as follows:

Sample	Visual Soil Classification	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
B-6 @ 4’	Dark brown clayey silt	110.8	16.3
B-9 @ 1’	Dark brown clayey silt and fine sand	114.7	15.5

Direct Shear Tests
Strain controlled direct shear testing was performed on three relatively undisturbed samples and two remolded sample sets. The sample sets were saturated prior to shearing under axial loads ranging from 920 to 3,680 psf. The shear strength results are presented as graphic summaries.

Load Consolidation Testing
Load consolidation tests were conducted on six relatively undisturbed drive samples. Test loads were added in increments to a maximum of 8,000 psf. Water was added at the approximate overburden pressure to study the effect of moisture infiltration on potential consolidation behavior. The consolidation results are presented on the attached figures as graphic summaries.

Atterberg Limit Tests

Atterberg Limit tests were performed on a representative sample of the fine-grained material onsite.

Sample	Liquid Limit	Plasticity Index	Soil Classification
B-8 @ 10’	49	26	CL

Grain Size Distribution

Grain size distribution analyses were performed on three bulk soil samples. The grain size was evaluated by hydrometer analysis. Hydrometer analyses were performed using a 50-gram sample. A table summarizing the results is presented below.

HYDROMETER RESULTS							
Boring	**Depth (feet)**	**% Gravel**	**% Sand**	**% Silt**	**% Clay**	**% Fines (silt and clay)**	**Classification**
B-4	6	2	23	46	29	75	ML
B-4	25	1	53	31	15	46	SM
B-8	33	--	32	42	26	68	ML

Corrosion Testing

Two soil samples were sent under separate contract to be tested for corrosive properties. The test results are attached.

Atlantic Job No.: 2017-015

Subject: Soil Chemistry Analysis for Gorian Job # 2880-62-0-100
1 Sample: LAUSD – Reseda High School (B-1 @ 4')

Sample Number	As Rec'd Resistivity (ohm-cm)	[1]Minimum Resistivity (ohm-cm)	[2] Ph	[3] Sulfate %	[3] Chloride %	[4] Ammonia %	[5] Keldahl Nitrogen %	(As Rec'd) Description
B-1	4,400	1,120	7.25	0.0049	0.0082	<0.0001	0.0317	Medium Brown, Moist

<NOTE: SAMPLES WERE ANALYZED IN ACCORDANCE WITH THE FOLLOWING METHODS.

1. MINIMUM RESISTIVITY DETERMINED BY SOIL BOX METHOD, (PER ASTM 187)
2. PH MEASURED BY POTENTIOMETRIC METHOD USING STANDARD ELECTRODES. (PER CAL TRANS. #643)
3. CHLORIDE AND SULFATE WERE ANALYZED IN ACCORDANCE WITH EPA METHODS FOR CHEMICAL ANALYSIS FOR WATER AND WASTE, NO. 300 EPA-600/4-79-020. CONCENTRATION BY WEIGHT OF DRY SOIL.
4. AMMONIA WAS ANALYZED IN ACCORDANCE WITH EPA METHOD 350.2
5. KELDAHL NITROGEN WAS ANALYZED IN ACCORDANCE WITH EPA METHOD 351.2

CONCLUSIONS:

Material	**Corrosion Class**	**Recommendation**
Concrete	Negligible for sulfate and chloride exposure. pH is neutral to slightly basic.. (ACI 318)	-Type II Portland cement for concrete with maximum water cement ratio of 0.50 and a minimum of 3 inches of cover for steel reinforcement. - It is recommended that an impermeable moisture barrier (minimum 6 mil visqueen) be installed between concrete slabs and soil to reduce penetration of moisture from the soil into concrete slabs.
Steel Cast/Ductile Iron Mortar Coated Steel	Moderately Corrosive	- Install corrosion monitoring and cathodic protection for buried metal structures and piping. - Install joint bonds on all non-welded joints for buried ferrous metal piping to facilitate proper operation of corrosion monitoring and cathodic protection systems. - Electrically isolate underground metal piping from above grade piping and other metallic structures. - Use separate ground rods for grounding interior piping.
Copper Piping	Corrosive.	- Overhead plumbing is the most effective method of corrosion control. - Copper pipe is subject to corrosion when exposed to even trace amounts of ammonia and nitrogen. - Electrical isolation between hot and cold water lines and between structural steel should be maintained.

USGS Design Maps Detailed Report

ASCE 7-10 Standard (34.18943°N, 118.53011°W)

Site Class D – "Stiff Soil", Risk Category I/II/III

Section 11.4.1 — Mapped Acceleration Parameters

Note: Ground motion values provided below are for the direction of maximum horizontal spectral response acceleration. They have been converted from corresponding geometric mean ground motions computed by the USGS by applying factors of 1.1 (to obtain S_S) and 1.3 (to obtain S_1). Maps in the 2010 ASCE-7 Standard are provided for Site Class B. Adjustments for other Site Classes are made, as needed, in Section 11.4.3.

From Figure 22-1 [1]	S_S = 1.760 g
From Figure 22-2 [2]	S_1 = 0.620 g

Section 11.4.2 — Site Class

The authority having jurisdiction (not the USGS), site-specific geotechnical data, and/or the default has classified the site as Site Class D, based on the site soil properties in accordance with Chapter 20.

Table 20.3–1 Site Classification

Site Class	$\overline{v}_S$	$\overline{N}$ or $\overline{N}_{ch}$	$\overline{s}_u$
A. Hard Rock	>5,000 ft/s	N/A	N/A
B. Rock	2,500 to 5,000 ft/s	N/A	N/A
C. Very dense soil and soft rock	1,200 to 2,500 ft/s	>50	>2,000 psf
D. Stiff Soil	600 to 1,200 ft/s	15 to 50	1,000 to 2,000 psf
E. Soft clay soil	<600 ft/s	<15	<1,000 psf
	Any profile with more than 10 ft of soil having the characteristics: • Plasticity index PI > 20, • Moisture content w ≥ 40%, and • Undrained shear strength $\overline{s}_u$ < 500 psf		
F. Soils requiring site response analysis in accordance with Section 21.1	See Section 20.3.1		

For SI: 1ft/s = 0.3048 m/s 1lb/ft² = 0.0479 kN/m²

Section 11.4.3 — Site Coefficients and Risk–Targeted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration Parameters

Table 11.4–1: Site Coefficient F_a

Site Class	Mapped MCE_R Spectral Response Acceleration Parameter at Short Period				
	$S_S \le 0.25$	$S_S = 0.50$	$S_S = 0.75$	$S_S = 1.00$	$S_S \ge 1.25$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of S_S

For Site Class = D and S_S = 1.760 g, F_a = 1.000

Table 11.4–2: Site Coefficient F_v

Site Class	Mapped MCE_R Spectral Response Acceleration Parameter at 1–s Period				
	$S_1 \le 0.10$	$S_1 = 0.20$	$S_1 = 0.30$	$S_1 = 0.40$	$S_1 \ge 0.50$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.7	1.6	1.5	1.4	1.3
D	2.4	2.0	1.8	1.6	1.5
E	3.5	3.2	2.8	2.4	2.4
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of S_1

For Site Class = D and S_1 = 0.620 g, F_v = 1.500

Equation (11.4–1):	$S_{MS} = F_a S_S = 1.000 \times 1.760 = 1.760$ g

Equation (11.4–2):	$S_{M1} = F_v S_1 = 1.500 \times 0.620 = 0.930$ g

Section 11.4.4 — Design Spectral Acceleration Parameters

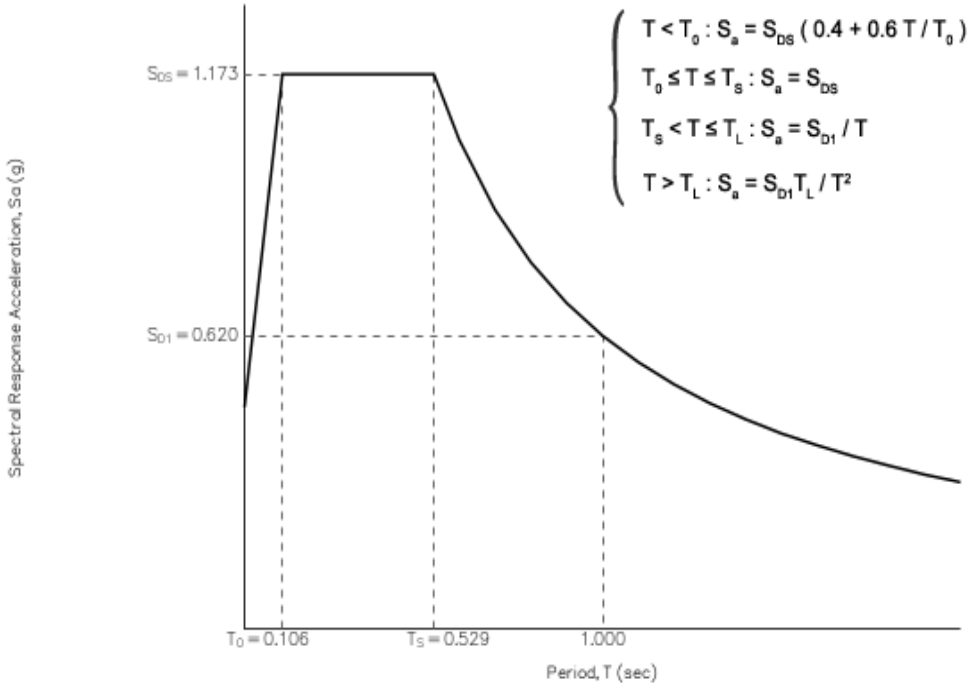
Equation (11.4–3):	$S_{DS} = ⅔ S_{MS} = ⅔ \times 1.760 = 1.173$ g

Equation (11.4–4):	$S_{D1} = ⅔ S_{M1} = ⅔ \times 0.930 = 0.620$ g

Section 11.4.5 — Design Response Spectrum

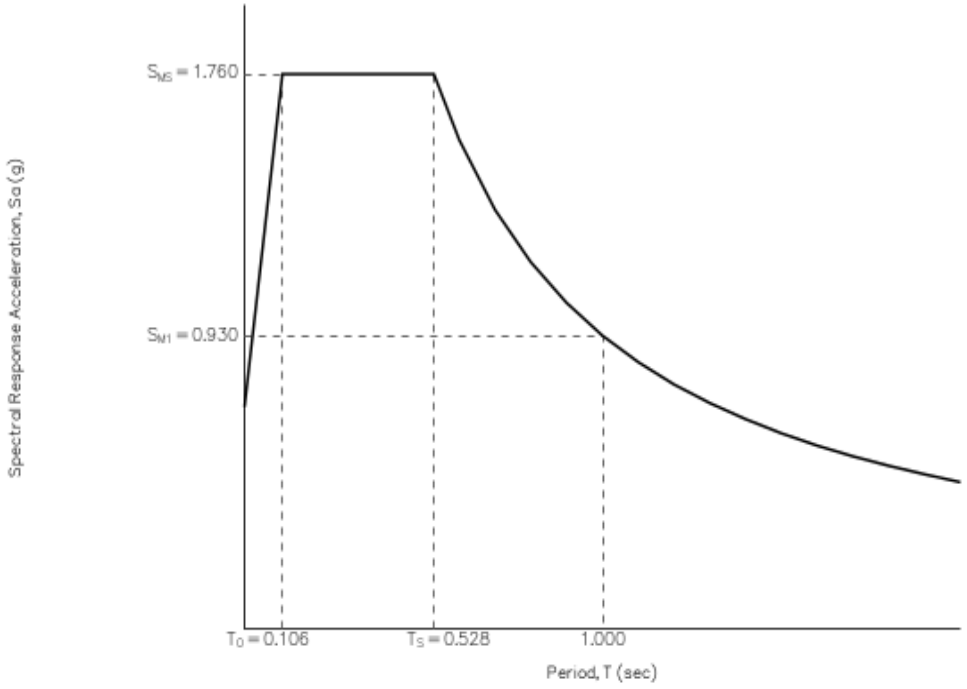
From Figure 22-12 [3]	T_L = 8 seconds

Figure 11.4–1: Design Response Spectrum



Section 11.4.6 — Risk-Targeted Maximum Considered Earthquake (MCE_R) Response Spectrum

The MCE_R Response Spectrum is determined by multiplying the design response spectrum above by 1.5.



Section 11.8.3 — Additional Geotechnical Investigation Report Requirements for Seismic Design Categories D through F

From Figure 22-7 [4] — PGA = 0.645

Equation (11.8–1): — $PGA_M = F_{PGA}PGA = 1.000 \times 0.645 = 0.645$ g

Table 11.8–1: Site Coefficient F_{PGA}

Site Class	Mapped MCE Geometric Mean Peak Ground Acceleration, PGA				
	PGA ≤ 0.10	PGA = 0.20	PGA = 0.30	PGA = 0.40	PGA ≥ 0.50
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.2	1.2	1.1	1.0	1.0
D	1.6	1.4	1.2	1.1	1.0
E	2.5	1.7	1.2	0.9	0.9
F	See Section 11.4.7 of ASCE 7				

Note: Use straight–line interpolation for intermediate values of PGA

For Site Class = D and PGA = 0.645 g, $F_{PGA} = 1.000$

Section 21.2.1.1 — Method 1 (from Chapter 21 – Site-Specific Ground Motion Procedures for Seismic Design)

From Figure 22-17 [5] — $C_{RS} = 1.028$

From Figure 22-18 [6] — $C_{R1} = 1.039$

Section 11.6 — Seismic Design Category

Table 11.6-1 Seismic Design Category Based on Short Period Response Acceleration Parameter

VALUE OF S_{DS}	RISK CATEGORY		
	I or II	III	IV
$S_{DS} < 0.167g$	A	A	A
$0.167g \le S_{DS} < 0.33g$	B	B	C
$0.33g \le S_{DS} < 0.50g$	C	C	D
$0.50g \le S_{DS}$	D	D	D

For Risk Category = I and S_{DS} = 1.173 g, Seismic Design Category = D

Table 11.6-2 Seismic Design Category Based on 1-S Period Response Acceleration Parameter

VALUE OF S_{D1}	RISK CATEGORY		
	I or II	III	IV
$S_{D1} < 0.067g$	A	A	A
$0.067g \le S_{D1} < 0.133g$	B	B	C
$0.133g \le S_{D1} < 0.20g$	C	C	D
$0.20g \le S_{D1}$	D	D	D

For Risk Category = I and S_{D1} = 0.620 g, Seismic Design Category = D

Note: When S_1 is greater than or equal to 0.75g, the Seismic Design Category is E for buildings in Risk Categories I, II, and III, and F for those in Risk Category IV, irrespective of the above.

Seismic Design Category ≡ "the more severe design category in accordance with Table 11.6-1 or 11.6-2" = D

Note: See Section 11.6 for alternative approaches to calculating Seismic Design Category.

USGS Design Maps Detailed Report

ASCE 41-13 Retrofit Standard, BSE-1E (34.18943°N, 118.53011°W)

Site Class D – "Stiff Soil"

Section 2.4.1 – General Procedure for Hazard Due to Ground Shaking

20%/50-year maximum direction spectral response acceleration for 0.2s and 1.0s periods, respectively:

From Section 2.4.1.4	$S_{S,20/50}$ = 0.813 g
From Section 2.4.1.4	$S_{1,20/50}$ = 0.291 g

Section 2.4.1.6 – Adjustment for Site Class

The authority having jurisdiction (not the USGS), site-specific geotechnical data, and/or the default has classified the site as Site Class D, based on the site soil properties in accordance with Section 2.4.1.6.1.

SITE CLASS	SOIL PROFILE NAME	Soil shear wave velocity, $\overline{v}_S$, (ft/s)	Standard penetration resistance, $\overline{N}$	Soil undrained shear strength, $\overline{s}_u$, (psf)
A	Hard rock	$\overline{v}_S$ > 5,000	N/A	N/A
B	Rock	2,500 < $\overline{v}_S$ ≤ 5,000	N/A	N/A
C	Very dense soil and soft rock	1,200 < $\overline{v}_S$ ≤ 2,500	$\overline{N}$ > 50	>2,000 psf
D	Stiff soil profile	600 ≤ $\overline{v}_S$ < 1,200	15 ≤ $\overline{N}$ ≤ 50	1,000 to 2,000 psf
E	Stiff soil profile	$\overline{v}_S$ < 600	$\overline{N}$ < 15	<1,000 psf
E	—	Any profile with more than 10 ft of soil having the characteristics: 1. Plasticity index PI > 20, 2. Moisture content w ≥ 40%, and 3. Undrained shear strength $\overline{s}_u$ < 500 psf		
F	—	Any profile containing soils having one or more of the following characteristics: 1. Soils vulnerable to potential failure or collapse under seismic loading such as liquefiable soils, quick and highly sensitive clays, collapsible weakly cemented soils. 2. Peats and/or highly organic clays (H > 10 feet of peat and/or highly organic clay where H = thickness of soil) 3. Very high plasticity clays (H > 25 feet with plasticity index PI > 75) 4. Very thick soft/medium stiff clays (H > 120 feet)		

For SI: 1ft/s = 0.3048 m/s 1lb/ft² = 0.0479 kN/m²

Table 2–3. Values of F_a as a Function of Site Class and Mapped Short-Period Spectral Response Acceleration S_s

Site Class	Mapped Spectral Acceleration at Short-Period S_s				
	$S_S \leq 0.25$	$S_S = 0.50$	$S_S = 0.75$	$S_S = 1.00$	$S_S \geq 1.25$

E	2.5	1.7	1.2	0.9	0.9
F	Site-specific geotechnical and dynamic site response analyses shall be performed				

Note: Use straight–line interpolation for intermediate values of S_S

For Site Class = D and $S_S = 0.813$ g, $F_a = 1.175$

Table 2–4. Values of F_v as a Function of Site Class and Mapped Spectral Response Acceleration at 1 s Period S_1

Site Class	Mapped Spectral Acceleration at 1 s Period S_1				
	$S_1 \leq 0.10$	$S_1 = 0.20$	$S_1 = 0.30$	$S_1 = 0.40$	$S_1 \geq 0.50$
A	0.8	0.8	0.8	0.8	0.8
B	1.0	1.0	1.0	1.0	1.0
C	1.7	1.6	1.5	1.4	1.3
D	2.4	2.0	1.8	1.6	1.5
E	3.5	3.2	2.8	2.4	2.4
F	Site-specific geotechnical and dynamic site response analyses shall be performed				

Note: Use straight–line interpolation for intermediate values of S_1

For Site Class = D and $S_1 = 0.291$ g, $F_v = 1.819$

Provided as a reference for Equation (2-4):	$F_aS_{S,20/50}$ = 1.175 x 0.813 g = 0.955 g
Provided as a reference for Equation (2-5):	$F_vS_{1,20/50}$ = 1.819 x 0.291 g = 0.529 g
Provided as a reference for Equation (2-4):	$S_{XS,BSE-1N}$ = ⅔ x $S_{XS,BSE-2N}$ = ⅔ x $F_aS_{S,BSE-2N}$ = 1.173 g
Provided as a reference for Equation (2-5):	$S_{X1,BSE-1N}$ = ⅔ x $S_{X1,BSE-2N}$ = ⅔ x $F_vS_{1,BSE-2N}$ = 0.620 g

Equation (2–4): $S_{XS,BSE-1E}$ = MIN[$F_aS_{S,20/50}$, $S_{XS,BSE-1N}$] = MIN[0.955g, 1.173g] = 0.955g

Equation (2–5): $S_{X1,BSE-1E}$ = MIN[$F_vS_{S,20/50}$, $S_{X1,BSE-1N}$] = MIN[0.529g, 0.620g] = 0.529g

Attention: Cristina Cho

Subject: **Additional Analyses, Reseda High School, 18230 Kittridge Street, Reseda, California**

Reference: Gorian and Associates, Inc., June 9, 2017, *Preliminary Geotechnical Site Evaluation, Reseda High School, 18230 Kittridge Street, Reseda, California*; Work Order: 2880-62-0-100.

Information was recently provided to us indicating the buildings at Reseda High School are constructed on pile foundations. As such the anticipated differential seismic settlement may be re-evaluated. Based on discussions with the design team, the structural engineer has specifically selected the Assembly Building to evaluate. The provided plans, from 1953, show piles ranging in length from 20 to 49 feet, with individual piles or groups supporting loads varying from 15 to 317 kips (Plan Sheet S-X14, Pile Schedules). Plan Sheet S-X12 Piling Details & Schedules indicates the piles could have been Raymond Step Taper, Union Metal Monotube or Pacific Union Metal Co. Spun Pile.

Pile Capacity

Back calculation of the pile sizes, lengths and loads leads to a shear strength on the order of 500 psf increasing with depth to approximately 1,500 psf.

The 1953 borings closest to the Assembly Building, shown on Sheet 2 of 105, Key Plot Plan are boring 3 north of the building and boring 4 south of the building, both on the west side. The 1953 boring logs indicate primarily silty to sandy clays and clayey silts in the borings, with sandy silt within the upper 5 to 8 feet and in boring 4 a layer of silty sand at about 15 feet bgs. No laboratory testing or evidence of sample collection was indicated on the boring log or Plot Plan.

Soil Strength from CPT Data

The Cone Penetrometer Test (CPT) closest to the building was CPT-5. The cone sounding and interpretation, attached, indicate sand layers from approximately 30 to 32 feet below ground surface (bgs) and from approximately 34 to 41 feet bgs. The intermediate soils are silts and clays. The undrained shear strength from the CPT averaged 1,000 to 3,000 psf.

Seismic Settlement

The previous evaluation of CPT-5 yielded seismically induced settlement of approximately 2.8 inches. The settlement primarily occurs in two regions; from 29 to 36 feet bgs and from 43 to 49 feet bgs. Therefore, for the shorter piles, less than about 30 feet in length, it should be assumed that they could experience over 2 inches of total seismic settlement. The deeper piles may experience less seismic settlement but would be subject to down drag forces.

Conclusions and Recommendations

Only one exploration point, CPT-5 was performed near the Assembly Building. The building is supported on single piles and in pile groups consisting of up to five piles. The soil conditions are suitable to support the existing static load and possibly some increased load. Since the option of three different pile types were provided with two different pile lengths, it would be useful to know which type of pile was used to support the column loads.

To evaluate differential settlement additional exploration and testing will be required. Otherwise, in general differential settlement is assumed to be one-half of the total settlement. This would yield differential seismic settlement on the order of 1.4 inches across about 40 feet.

If the soil were to settle as indicated by CPT-5, the down drag forces would be applied to the entire pile.

Further discussions regarding proposed retrofit / remediation should occur among the design consultants.

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Middle Earth Geo Testing

* Indicates the parameter was calculated using the normalized point stress.
The parameters listed above were determined using empirical correlations.
A Professional Engineer must determine their suitability for analysis and design.

Project ID: Gorian & Associates
Data File: SDF(709).cpt
CPT Date: 4/12/2017 7:09:57 AM
GW During Test: 31 ft

Sounding ID: CPT-05
Project No: 2880-62-0-100
Cone/Rig: DDG1350

1 INTRODUCTION

Ninyo & Moore was retained by Los Angeles Unified School District (LAUSD or District), herein referred to as the client to perform a Phase I Environmental Site Assessment (ESA) of the LAUSD Reseda High School located at 18230 Kittridge Street, Reseda, California (hereinafter referred to as the site). The following sections discuss the purpose, the involved parties, the scope of services, and the limitations and exceptions associated with the Phase I ESA.

1.1 Purpose

In accordance with the ASTM International (ASTM) Standard Practice for ESAs on Commercial Real Estate E1527-13, the objective of the Phase I ESA is to evaluate recognized environmental conditions (RECs). The term recognized environmental conditions means "the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."

Identification of RECs fall into the following three categories: existing RECs (as defined above); Historical RECs (HRECs); or Controlled RECs (CRECs). HRECs and CRECs are defined as follows:

- HREC – An HREC is defined as "a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations [AULs], institutional controls, or engineering controls)." An HREC is an environmental condition, which in the past, would have been considered a recognized environmental condition, but currently may or may not be considered a recognized environmental condition. An example of an HREC may be a former gas station where a release of gasoline had occurred, but the site was cleaned up to an unrestricted land use standard.

- CREC – A CREC is defined as a "recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by a regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, AULs, institutional controls, or engineering controls)." An example of a CREC could be a former gas station where a release of gasoline has been cleaned up to a commercial use standard, but does not meet unrestricted residential cleanup criteria.

1.2 Scope of Services

Ninyo & Moore's scope of services for this Phase I ESA included the activities listed below.

- Reviewed physical setting and background information.
- Performed a site and vicinity reconnaissance to visually observe areas of possibly contaminated surficial soil or surface water, improperly stored hazardous materials, suspect asbestos-containing materials (ACMs), suspect lead-based paint (LBP), possible sources of polychlorinated biphenyls (PCBs), and possible risk of contamination from activities at the site and adjacent or nearby properties.
- Reviewed federal, state, tribal, and local regulatory agency databases for the site and for properties located within a specified radius of the site.
- Reviewed reasonably ascertainable local regulatory agency files for the site, as applicable.
- Reviewed historical information for the site, such as historical aerial photographs, historical topographic maps, reverse street directories, Sanborn fire insurance maps, and building department records.
- Requested records from the local Air Quality Management District to evaluate properties within a ¼ mile radius of the site for possible activities that may reasonably be anticipated to have hazardous air emissions.
- Requested records in writing from the California State Fire Marshal regarding the possible presence of underground hazardous materials-conveying pipelines within 1,500 feet of the site along with the local natural gas utility (Southern California Gas Company) information for review and incorporation into the report.
- Reviewed user-provided information, as available.
- Interviewed the property owner representative regarding the environmental status of the site.
- Obtained an environmental lien report from a third-party vender to search for environmental liens and activity use limitations.
- Performed a preliminary vapor encroachment screen to evaluate the potential for vapor encroachment conditions.
- Prepared this Phase I ESA report, summarizing findings and providing opinions and conclusions regarding RECs at the site.

1.3 Significant Assumptions

Ninyo & Moore assumes the information sources from the third-party environmental database vendor, regulatory agencies, and interviewees utilized for this report provided adequate and accurate information. No other significant assumptions were made during the preparation of this report.

1.4 Limitations and Exceptions

The environmental services described in this report have been conducted in general accordance with current regulatory guidelines and the standard of care exercised by environmental consultants performing similar work in the project area. No warranty, expressed or implied, is made regarding the professional opinions presented in this report.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. Ninyo & Moore should be contacted if the reader requires any additional information or has questions regarding the content, interpretations presented, or completeness of this document.

The findings, opinions, and conclusions are based on an analysis of the observed site conditions and the referenced literature. It should be understood that the conditions of a site could change with time as a result of natural processes or the activities of man at the subject site or nearby sites. In addition, changes to the applicable laws, regulations, codes, and standards of practice may occur due to government action or the broadening of knowledge. The findings of this report may, therefore, be invalidated over time, in part or in whole, by changes over which Ninyo & Moore has no control. Ninyo & Moore cannot warrant or guarantee that not finding indicators of any particular hazardous material means that this particular hazardous material or any other hazardous materials do not exist on the site. Additional research, including invasive testing, can reduce the uncertainty, but no techniques now commonly employed can eliminate the uncertainty altogether.

1.5 Special Terms and Conditions

This study did not include an evaluation of geotechnical conditions or potential geologic hazards. In addition, unless otherwise indicated in this report, this Phase I ESA does not include analysis of the following, which is not intended to be all-inclusive: asbestos-containing materials, methane gas, radon, lead-based paint, lead-containing surfaces, lead in drinking water, wetlands, regulatory compliance, cultural and historic resources, industrial hygiene, health and safety, ecological resources, endangered species, or mold.

1.6 User Reliance

This report may be relied upon by, and is intended exclusively for, the client and its assigns. Any use or reuse of the findings, opinions, and/or conclusions of this report by parties other than the above-referenced client is undertaken at said parties' sole risk.

1.7 Involved Parties

Ms. Manasi Chavan, Senior Staff Engineer, conducted interviews on June 19, 2017, the site reconnaissance on June 30, 2017, and performed regulatory and historical research. Mr. Patrick Cullip, Project Engineer and Mr. Anthony Lizzi, Principal Geologist, performed quality review of the document.

2 SITE DESCRIPTION

The following table provides a general description of the subject site. Photographs taken during the site reconnaissance are provided in Appendix A.

Table 1 – General Site Setting

General Site Setting	Description
Location	The site is located at the southwest corner of the intersection of Kittridge Street and Lindley Avenue, north of the Los Angeles River (Figures 1, 2, and 3).
Assessor Parcel No.	2124-001-904 (County of Los Angeles)
Property Owner	LAUSD
Size (approximate)	29.15 acres
Site Use / Occupants	The site is developed with a school.
Structures	Sixteen permanent and several portable buildings.
Roads	Roads are not present at the site. The site is accessible via driveways along Kittridge Street and Etiwanda Avenue, adjacent to the north and west, respectively.
Heating and Cooling Systems	Roof-mounted units
Electricity and Natural Gas Provider	Los Angeles Department of Water and Power (LADWP) and Southern California Gas Company
Sewer Disposal Provider	City of Los Angeles
Potable Water Provider	LADWP
Site Vicinity Description	Primarily residential to the north and east, Los Angeles River to the south, and Reseda Park to the west.

3 RECORDS REVIEW

The following sections summarize records reviewed for the site.

3.1 Standard Environmental Record Source - Environmental Database Search

A computerized, environmental information database search was performed by EDR on June 20, 2017. The search included federal, state, tribal, and local databases. A summary of the environmental databases searched, their corresponding search radii, and number of noted properties of potential environmental concern, is presented in the EDR report (Appendix B). The review was conducted to evaluate whether the site or properties within the site vicinity have

been documented as having experienced significant unauthorized releases of hazardous substances or other events with potentially adverse environmental effects.

3.1.1 Geocoded (Mapped) Listings

The site was listed in the Facility and Manifest Data (Hazardous Materials Manifests Network [HAZNET]) database as City of Los Angeles - DPW - Bureau Sanitation and LAUSD/Reseda High School. Various hazardous wastes were removed from the site from 1993 to 2013, including household waste, laboratory waste chemicals, other inorganic solid waste, asbestos containing waste, other organic solids, alkaline solution without metals pH>=12.5, off-specification, aged or surplus organics, and waste oil and mixed oil.

The site (reported as Grey Continuation High School in EDR report) was listed on the Resource Conservation and Recovery Act (RCRA) and on the Enforcement and Compliance History Online (ECHO) databases as a large quantity generator of lead in 2008. Violations were not reported for these site listings.

The site was listed in the Facility Index System/ Facility Registry System (FINDS) database as Grey Continuation High School and LAUSD - Reseda High School pointing to other database listings discussed above. These listings are not indicative of a release and would not be considered a REC.

Off-site properties within a 1 mile radius of the site were listed on various regulatory agency databases. The following table lists databases that were searched and the number of listings (excluding non-geocoded [unmapped] properties).

Table 2 – Summary of Environmental Database Search

Database Name	Search Radius (mile)	Number of Listings
FEDERAL DATABASES		
NPL (National Priority List)	1	0
Proposed NPL	1	0
NPL LIENS (Federal Superfund Liens)	TP	0
Delisted NPL	1	0
FEDERAL FACILITY (Federal Facility Site Information listing)	1	0
SEMS (Superfund Enterprise Management System; formerly Comprehensive Environmental Response Compensation and Liability Information System)	0.5	0
SEMS-ARCHIVE (Superfund Enterprise Management System Archive)	0.5	0
CORRACTS (facilities subject to Corrective action under RCRA)	1	0
RCRA-TSDF (hazardous waste treatment, storage, or disposal facilities)	0.5	0
RCRA-LQG (large quantity generator)	0.25	1
RCRA-SQG (small quantity generator)	0.25	3
RCRA-CESQG (conditionally exempt SQG)	0.25	0
US ENGINEERING CONTROL (EC)	0.5	0
US INSTITUTIONAL CONTROL (IC)	0.5	0
ERNS (Emergency Notification System)	TP	0

Table 2 – Summary of Environmental Database Search		
Database Name	**Search Radius (mile)**	**Number of Listings**
STATE/TRIBAL DATABASES		
RESPONSE (State Response Sites, State- and Tribal- equivalent NPL)	1	0
ENVIROSTOR (The DTSC's Site Mitigation and Brownfields Reuse Program; CERCLIS-equivalent)	1	4
SWF/LF (Solid Waste Information System)	0.5	1
LUST (GeoTracker's Leaking Underground Fuel Tank Report)	0.5	12
SLIC (Spills, Leaks, Investigation and Cleanup database by the California Regional Water Quality Control Board)	0.5	1
UST (registered underground storage tanks [USTs])	0.25	0
AST (registered aboveground storage tanks [ASTs])	0.25	0
FEMA UST (Underground Storage Tank Listing)	0.25	0
VCP (Voluntary Cleanup Program Properties)	0.5	0
Notes: TP = Target Property LUST = Leaking Underground Storage Tank		

Off-site properties/facilities listed in the database report were evaluated as to their potential to impact soil and/or groundwater at the site. To supplement the information in the EDR report, the State Water Resources Control Board (SWRCB) GeoTracker online database was reviewed. Information from the EDR database report and supplemental sources is included in the facilities of potential concern summaries below. The following properties/facilities were interpreted to represent a potential environmental concern to the site, based on their proximity to the site, the nature of the database on which they are listed, and/or the assumed direction of groundwater flow in the site vicinity (east-southeast).

Table 3 – Off-Site Facilities of Potential Concern			
Facility Name / Address	**Distance/ Direction from Site**	**Database**	**Summary**
Reseda Park MTSE Ser Yard/ Rec and Parks 6503 Etiwanda Ave	Adjacent west-northwest	SWEEPS UST CA FID UST HIST UST	One active 280-gallon unleaded motor vehicle fuel UST was reported at this property. No violations were reported. Based on the absence of a release or spill, this property is not a concern to the subject site at this time.
Leon Automotive Center Inc/ Union 76/ A-1 Union 76 Service Station 18102 W Victor Blvd	143 feet south-southeast	LUST SWEEPS UST CA FID UST CHMIRS EDR Hist Auto	A gasoline station was reported at this property from 1969 to 2014. A caller reported in 2016 that the former auto shop at this property was dumping motor oil, transmission fluid, and antifreeze into the sewer system every day The former occupant, HISCO, was a small quantity generator of hazardous waste. According to GeoTracker records, this property was a former 76 gasoline station with two 12,000-gallon gasoline and one 550-gallon waste oil USTs that were removed in 2000. Several soil and groundwater sampling and monitoring activities were conducted at this property. Clean up was conducted and this property and was granted regulatory closure in 2016. Based on regulatory closure and downgradient hydrologic position relative to the site, this property is not a concern to the subject site at this time.

Table 3 – Off-Site Facilities of Potential Concern			
Facility Name / Address	**Distance/ Direction from Site**	**Database**	**Summary**
Lindley Avenue Transfer Station 6351 Lindley Avenue	370 feet south-southeast	SWF/LF RCRA-SQG	This on-acre property was listed as a limited volume transfer operation that accepts construction/ demolition, green materials, and mixed municipal waste. Inspection reports from 1993 through 2017 were available for review on the California Integrated Waste Management Board's CalRecycle website (CIWMB, 2017). Violations and Areas of Concerns were issued to the property in 1993, 1994, 195, 1997, and 2002 for housekeeping, paperwork, and permitting issues. Based on this information and downgradient hydrologic position relative to the site, this property is not a concern to the subject site at this time.

Notes:
- Distances and direction provided by EDR
- A description of each database is provided in the EDR Report (Appendix B).

It is our opinion that there is a low likelihood that the remaining listings for offsite properties listed in the database report represent a REC to the site at the current time. This opinion is based on one or more of the following factors:

- The nature of the database(s) on which the property was listed, and/or because the property was not listed on a database that reports unauthorized releases of hazardous substances;
- Reported regulatory agency status (i.e., case closed);
- Reported nature of the case (i.e., soil contamination only);
- Reported distance of the property from the site; and/or
- Location of the property in relation to the site with respect to topography or expected groundwater flow direction (east-southeast).

3.1.2 Non-Geocoded (Unmapped) Listings

This portion of the regulatory database report includes properties for which regulatory agencies did not report sufficient address information to be plotted by EDR. Four unmapped facilities were included in the EDR Radius Map™ report. Based on our reconnaissance of the site vicinity and a review of the unmapped listings, they are not within the applicable search radii. There is low likelihood that the unmapped facilities have a negative environmental effect on the subject site.

3.2 Additional Environmental Record Sources

According to the ASTM Standard, "if the property or any of the adjoining properties is identified on one or more of the standard environmental record sources, pertinent regulatory files and/or

records associated with the listing should be reviewed." Regulatory agency files from adjacent properties and other properties of potential concern were reviewed and summarized in Table 4. The review of regulatory agency records for the site is discussed in the following sections. Regulatory records for the site and properties of potential concern are provided in Appendix C.

3.2.1 Los Angeles Fire Department (LAFD)

Ninyo & Moore submitted records requests to the LAFD – UST Division and LAFD – Hazardous Materials Division. According to the LAFD – UST Division, records were not available for the site. The LAFD – Hazardous Materials Division indicated records were available for the site address.

An inventory summary for the site included inactive (since 1991) listings for several chemicals including "A B dick mimeograph correction fluid", belt cleaner, block print ink, brake fluid, CB-40, cleaner-auto parts, cleanser, commercial fertilizer, DDC, dispersant, dye for plastic laminating, Elmer's school glue, hydraulic oil tanks (up to 40 gallons), lac motor oil, printer's ink, sewing machine oil, WD-40, weed wrangler; and active listings for diesel (up to 55 gallons) and gasoline (up to 165 gallons). Based on the inactive nature of several of the listed chemicals and proper storage (55-gallon drums on sand covered floor) of gasoline and diesel at the site (see Section 4.4), this information would not be considered an environmental concern to the site.

3.2.2 Regional Water Quality Control Board, Los Angeles Region

According to a representative of the Regional Water Quality Control Board on June 26, 2017, no files were found for the site address.

3.2.3 California Department of Toxic Substances Control (DTSC)

Ninyo & Moore requested records for the site from the DTSC – Chatsworth and Cypress offices. According to the DTSC – Chatsworth and Cypress offices, records were not found for the site address.

3.2.4 Los Angeles Department of Public Works (LADPW)

Ninyo & Moore reviewed the Los Angeles Department of Public Works online file review website for information on the site addresses and closed LUST case. According to the LADPW website, records related to industrial waste, USTs, or stormwater were not found.

3.2.5 South Coast Air Quality Management District (SCAQMD)

In accordance with Section 17213 of the California Code of Education, properties located within a ¼-mile radius of the site that might reasonable be anticipated to emit hazardous air emissions should be evaluated. Ninyo & Moore reviewed records for facilities within a ¼-mile radius of the site address from SCAQMD's Facility Information Database (FIND) website.

The site was listed as LAUSD, Reseda High School for inactive boilers and two inactive permits for spray paint booths (each with a different dimension) from 1964. Notices of violation or notices to comply were not issued for the site. Boilers and/or spray paint booths were not observed during Ninyo & Moore's site reconnaissance. The former presence of spray paint booths on-site represent a REC.

Listings for two facilities were found within a ¼-mile radius of the site: Los Angeles City Recreation & Parks Department at 6503 Etiwanda Avenue, adjacent to the west of the site and Firehouse Restaurant, J Melitsopoulos Etc. at 18450 Victory Boulevard, approximately 0.22 miles southwest of the site. Firehouse Restaurant, J Melitsopoulos Etc. was listed for a natural gas charbroiler in 1990 (inactive). Los Angeles City Recreation & Parks Department was listed for an inactive 280-gallon gasoline storage tank in 1993. Notices of violation or notices to comply were not issued for these facilities. Based on the review of these listings, it is unlikely that these listings pose an environmental concern.

3.2.6 Online Regulatory Databases

Online regulatory databases were reviewed by Ninyo & Moore to supplement the environmental database search conducted by EDR. The following is a summary of pertinent information.

Table 4 – Online Regulatory Databases

Online Database/Website	Findings
California Department of Toxic Substances Control (DTSC) EnviroStor	Neither the site nor properties within 1,000 feet are listed.
State Water Resources Control Board (SWRCB) GeoTracker	The site was not listed, The property listed within 1,000 feet is discussed in Section 4.1.1 – Table 4.
California Department of Resources Recycling and Recovery (CalRecycle) Solid Waste Information System	Neither the site nor properties within 1,000 feet are listed.
United States Pipeline and Hazardous Materials Safety Administration, National Pipeline Mapping System Map Viewer	Pipelines are not depicted on or adjacent to the site. Pipelines are further discussed in Section 5.2
US Army Corps of Engineers, Formerly Used Defense Sites (FUDS), Geographic Information System	FUDS listings are not depicted within 1,000 feet of the site.

3.3 Physical Setting

The following table summarizes topographic, geologic, and hydrogeologic conditions in the vicinity of the site, based upon the referenced documents review and/or our visual reconnaissance of the site.

Table 5 – Physical Setting

Physical Settings	Reference	Summary
Topography	A	The site elevation ranges from approximately 725 feet above mean sea level (MSL). The regional topography slopes to the east-southeast.
Site Geology	B	The site is underlain generalized soil types (Q) primarily comprised of non-marine and marine (continental) sedimentary rock from the Pleistocene to Holocene periods.
Surface Water	A	The nearest surface water is the Reseda Park Lake, located approximately 500 feet to the west of the site.
Groundwater	C	Groundwater information specific to the site was not available. According to the State Water Resources Control Board (SWRCB) GeoTracker website (www.geotracker.swrcb.ca.gov), groundwater was measured at Leon Automotive Center, Inc. at 18102 Victory Boulevard, located adjacent to the south (cross-gradient) of the site, across from Victory Boulevard. Groundwater was encountered between approximate depths of 29.02 and 31.06 feet below ground surface (bgs), with groundwater flowing to the east-southeast, in the general direction of the regional topography. Groundwater levels, gradient, and flow direction can fluctuate due to seasonal variations, groundwater withdrawal or injection, changes in land use, and other factors.
Radon	D	Based on the results of California statewide radon surveys conducted in 2010 and updated in 2016 by the California Department of Health Services, the possibility that high levels of radon exist at the site is considered to be low. Radon concentrations at, or above, 4 picocuries per liter (pCi/l) are considered to be of environmental concern to the United States Environmental Protection Agency (EPA) and California EPA (Cal-EPA). Based on this survey, 142 tests for radon were conducted within the zip code in which the site is located (i.e., 91335) and 23 tests contained results with radon concentrations of 4 pCi/l or higher (up to 10.9 pCi/l). Radon testing was not performed at the site and was beyond the scope of services for this Phase I ESA.

3.4 Site Historical Use Information

Ninyo & Moore conducted a historical record search for the site. This included a review of city directories, historical fire insurance maps, historical aerial photographs, topographic maps, and building department records. The following sections summarize information obtained from the historical sources utilized for this assessment.

3.4.1 City Directories

Available historical reverse street directories from 1920 through 2014 were researched by EDR. The site address is listed as Reseda High School since 1956. The surrounding

properties were generally developed with residential and commercial. The EDR City Directory Report is provided in Appendix D.

3.4.2 Sanborn® Fire Insurance Maps

Sanborn® fire insurance maps were requested from EDR; however, according to EDR's Certified Sanborn Map Report, there is no map coverage in the site vicinity (Appendix D).

3.4.3 Historical Aerial Photographs

Historical aerial photographs were provided by EDR and reviewed online using Google Earth for select years from 1928 through 2016. A listing of the photographs reviewed and summary of notable observations from the photograph review are provided in the table below. EDR-provided aerial photographs are included in Appendix D.

Table 6 – Aerial Photographs Summary

Date	Source	Summary
1928 1938 1947	A	The site is developed as agricultural land with some structures in the northeast corner. Adjacent properties are depicted as agricultural and/or undeveloped land with scattered residential structures. The Los Angeles River is depicted adjacent to the southwest of the site. The current park to the west of the site is depicted beginning in 1938.
1952	A	The site is similar to that observed in 1947 aerial photograph, except that the structures in the northeast corner of the site are no longer present. Adjacent properties to the north and east of the site are heavily developed with residential properties.
1964 1967 1970 1972 1977 1983 1989 1995	A	The site is redeveloped with the current school improvements, except for some structures in the northeast, southeast, and southwest portions of the site. Additional residential and some commercial development is apparent to the south of the site.
2002	A	The site and adjacent properties are similar to those observed in 1995 aerial photograph, except that some additional structures are apparent in the southwest portion of the site.
2005	B	The site and adjacent properties are similar to those observed in 1995 aerial photograph, except that some additional structures are apparent in the northeast portion of the site.
2009 2010 2012 2016	A, B	The site and adjacent properties are similar to those observed in 1995 aerial photograph, except that some additional structures are apparent in the southeast portion of the site.

Sources: A – EDR
B – Google Earth

The site consisted of agricultural land (with some structures in the northeast corner from the 1920s to the 1940s) from the 1920s to 1954/1955, when the site was first developed with the current school buildings/ improvements. Based on the historical agricultural use of the property, commercial pesticides and herbicides have possibly been applied to the site and

site vicinity during the agricultural use of the land. Residual concentrations of these substances and/or their breakdown derivatives may be present in the site soils. The historical aerial photographs reviewed by Ninyo & Moore indicated the presence of some structures in the northeast portion of the site where pesticides or herbicides may have been mixed or stored. Based on our experience, it is our opinion that the former agricultural usage of the site with some structures in the northeast portion of the site is considered a REC.

3.4.4 Building Department Records

Ninyo & Moore reviewed building permits for the site on the Los Angeles Department of Building and Safety Permit and Inspection Report website (https://www.permitla.org/ipars/The_index.cfm). Several new building construction permits from 1954 and 1955 and certificates of occupancy (school) from 1955 and 1956 were noted. Review of building permit records did not indicate evidence of RECs associated with the site.

3.4.5 Historical Topographic Maps

Historical topographic maps were provided by EDR. A summary of the maps is provided in the table below and they are included in Appendix D.

Table 7 – Historical Topographic Maps Summary

Date	Summary
1903 1928	The site and surrounding area are depicted as vacant.
1928	A structure was observed in the northeast corner of the site. The surrounding area is depicted as vacant.
1944 1947	The site is developed as agricultural land in the west portion and a structure in the northeast corner. Adjacent properties are depicted with scattered residential structures. Reseda Park is depicted to the west of the site.
1952	The site was similar to that observed in 1947 topographic map, except that the structure in the northeast corner of the site is no longer present. Adjacent properties to the north and east are shown as dense urban areas.
1967	The site is depicted with current buildings. Adjacent properties are shown as dense urban areas.
2012	The site and vicinity are in their present day configurations. Individual structures are not shown.

3.4.6 Land Title Records

Historical land title records were not readily available.

3.4.7 Property Tax Records

Historical property tax records were not provided by the client for review or researched at http://assessor.lacounty.gov/.

3.4.8 Zoning/Land Use Records

According to the Los Angeles City Zone Information and Map Access System (ZIMAS) website (ZIMAS, 2017), the site is currently zoned "PF-1XL," for public facilities zone, which includes public elementary and secondary schools. Based on a review of the ZIMAS website, the following addresses are also associated with the site:

- 6500 and 6510 North Etiwanda Avenue
- 6541 and 6557 North Lindley Avenue
- 18130 West Kittridge Street

3.5 Previous Reports

Prior reports and/or documents were not provided for review.

3.6 Adjacent Property History

The adjacent properties consisted of agricultural and/or undeveloped land since the 1920s. The property to the west of the site was developed as Reseda Park in the 1940s. The properties to the north and east of the site were developed with residential structures starting in the 1950s. The properties to the south of the site were developed with residential and commercial structures starting in the 1960s.

4 SITE RECONNAISSANCE

The objective of the site reconnaissance was to obtain information indicating the potential for RECs in connection with the site. Ms. Manasi Chavan conducted the reconnaissance on June 30, 2017, and was accompanied by Mr. Diego Serrano, Plant Manager at Reseda High School. A site plan is provided as Figure 3 and photographic documentation is provided in Appendix A.

4.1 Methodology and Limiting Conditions

The site reconnaissance consisted of walking on the site and along public sidewalks (for viewing of adjacent/nearby properties). Limiting conditions were not encountered.

4.2 General Site Setting

At the time of the site reconnaissance, the site was developed with sixteen permanent and several portable buildings structures, athletic fields, and playground areas. The topography at the site is generally flat and in the site vicinity slopes to the east-southeast. Surface drainage is expected to flow to the Los Angeles River channel located to the south of the site.

4.3 Adjacent Property Observations

Adjacent properties were observed from the site and from publicly accessible vantage points (e.g., streets, sidewalks) during the site reconnaissance. The properties adjacent to the site are as follows and as depicted on Figure 2:

- **North**: Kittridge Street, followed by residential properties.
- **East**: Lindley Avenue, followed by residential properties.
- **South**: Los Angeles River, followed by ONEgeneration Senior Enrichment Center (18255 Victory Boulevard).
- **West**: Etiwanda Avenue, followed by Reseda Park.

4.4 Site Observations

Ninyo & Moore evaluated the site for evidence of the following potential environmental concerns:

Table 8 – Site Observations Summary

Conditions	Observed or Noted	Comments
Hazardous Substances/Petroleum Products	X	Three 55-gallon drums of gasoline and one 55-gallon drum of diesel were observed in a storage room of the utility building. Four propane cylinders and some paint containers were also observed in the storage room. The floor of the room was covered with sand, providing secondary containment. Minor surface staining was observed in the storage room, however cracked or degraded pavement was not observed. Small quantity (1-gallon to 5-gallon) containers of cleaning supplies, paint, and petroleum products were observed in the maintenance room of the utility building. Hazardous materials observed included ammonia, degreasers, glass cleaners, floor finish, paint, epoxy, and enamel. Minor surface staining was observed in the maintenance room; however, cracked or degraded pavement was not observed. Small quantity containers of various chemicals used for science classes were observed in storage rooms of the Science, Arts, and Industrial Arts buildings. Chemicals included ammonium sulfate, sodium iodine, potassium carbonate, acetone, acids (hydrochloric acid, acetic acid, etc.), toluene, and metals (zinc, aluminum, nickel, etc.).
Waste Generation/Storage/Disposal		Not observed
ASTs		Not observed
Potential Evidence of USTs		Not observed

Table 8 – Site Observations Summary		
Conditions	**Observed or Noted**	**Comments**
Potential PCB-Containing Equipment	X	One pad-mounted electrical transformer was observed within an electrical enclosure located south of the Industrial Arts building. Leaks or stains were not observed in the vicinity of the transformer. One pole-mounted transformer was observed on Etiwanda Avenue (off site), adjacent to the west of the site. Based on the DTSC guidelines, the presence of the transformer represents a REC.
Chemical/Petroleum Odors		Not observed
Concrete Patches/Pads		Not observed
Pools of Liquid		Not observed
Sewage Discharge Pipes		Not observed
Floor Drains/Sumps	X	Drains were observed within the former boiler room of the Utility building. The boiler room drains are not considered an environmental concern at this time.
Elevator		Not observed
Wells		Not observed
Drums	X	See discussion above.
Unidentified Substance Containers		Not observed
Stained Soil or Pavement		Not observed
Stressed Vegetation		Not observed
Pits, Ponds, or Lagoons		Not observed
Wastewater Discharges Disposal Systems	X	One inactive three-stage clarifier was observed adjacent to the south of the Industrial Arts building. The clarifier was associated with the former automotive shop. A grease trap was observed in the kitchen area of the Cafeteria building. A catch basin was observed in the ceramics classroom in the Science building. The presence of one inactive clarifier represents a REC for the site.
Septic Systems/Cesspools		Not observed
Municipal Solid Waste Disposal Areas	X	One brick incinerator (currently not in use) that was formerly used to burn trash was observed at the southwest side of the Utility building. Several dumpsters that are serviced by Republic Services were observed on the site.

5 CALIFORNIA EDUCATION CODE REQUIREMENTS AND DISTRICT BOARD RESOLUTIONS

Section 17213(a) of the California Education Code states that the governing board of a school district should evaluate if the school site contains the following where significant renovation is planned:

- A current or former hazardous waste disposal site or solid waste disposal site unless, if the site was a former solid waste disposal site, the school district concludes that the wastes have been removed.
- A hazardous substance release site identified by the State Department of Health Services in a current list adopted pursuant to Section 25356 of the Health and Safety Code.
- A site which contains one or more pipelines, situated underground or aboveground, which carry hazardous substances, acutely hazardous materials, or hazardous wastes, unless the pipeline is a natural gas pipeline which is used only to supply natural gas to that school or neighborhood.

Ninyo & Moore has assessed these conditions with respect to the site and are discussed in the following sections. California Department of Education (CDE) Checklist provides a summary of the CDE potential hazards which were evaluated as part of this Phase I ESA (Appendix E).

In addition, the California Education Code states that the governing board of a school district must identify facilities within 0.25 mile of the proposed school site which might reasonably be anticipated to emit hazardous air emissions, or to handle hazardous or acutely hazardous materials, substances, or waste; and the school board must determine that the health risks from the facilities do not and will not constitute an actual or possible endangerment of public health to persons who would attend or be employed at the school. A discussion of air emissions within 0.25 mile of the site is summarized in Section 3.2.5.

5.1 High-Voltage Electrical Transmission Lines

In accordance with Title 5, Section 14010 of the California Code of Regulations, the property line of a new school site should be at the following distance from the edge of respective power line easements: (1) 100 feet for a 50-133 kilovolt (kV) line, (2) 150 feet for a 220-230 kV line, and (3) 350 feet for a 500-550 kV line.

According to the site reconnaissance and the environmental database search performed for Ninyo & Moore by EDR, the closest overhead electrical transmission lines are located approximately 0.6 mile to the west of the site.

5.2 Underground Pipelines

The following paragraphs provide information regarding underground petroleum, natural gas, and water lines located within 1,500 feet of the site.

5.2.1 Natural Gas and Petroleum Pipelines

Hazardous liquid pipeline location information was reviewed through the U.S. Department of Transportation's Pipeline and Hazardous Materials Safety Administration's National Pipeline Mapping System (NPMS, www.npms.phmsa.dot.gov). According to the NPMS, pipelines are not depicted on or within 1,500 feet of the site.

Ninyo & Moore also reviewed the Gas Company website (http://www.socalgas.com/safety/pipeline-maps/LA.shtml) for information on pipeline location information. According to the Gas Company website, pipelines are not depicted on or within 1,500 feet of the site.

5.2.2 Water Pipelines

According to Ms. Jennifer Kurt of Los Angeles Department of Water and Power (LADWP), there are no high-pressure water pipelines within 1,500 feet of the site. There are water lines beneath Kittridge Street with lateral service, Lindley Avenue with lateral service, and Victory Boulevard, with pipe diameters ranging from 4 to 12 inches.

5.3 Railroad Tracks

During the site reconnaissance, railroad tracks were not observed within or adjacent to the site. According to the USGS Canoga Park Quadrangle map, railroad tracks are not present within 1,500 feet of the site.

5.4 Airports

According to the USGS Canoga Park Quadrangle map, Van Nuys Airport is located approximately 1.88 nautical miles northeast of the site.

5.5 Reservoirs/Water Storage Tanks

Large aboveground water storage tanks/reservoirs were not observed on or near the site during the site reconnaissance. According to Ms. Jennifer Kurt of LADWP, reservoirs/water storage tanks are not located within 1,500 feet of the site.

5.6 Asbestos and Lead-Based Paint (LBP)

Asbestos management and abatement plans are currently in place for the site. The on-site ACMs and LBP will be managed separately during the planned demolition, construction, and renovation activities by using the existing management plans as a starting point to be supplemented by additional sampling and analyses. Suspect ACMs and painted surfaces were observed to be in good condition. The presence of suspected lead from LBP in shallow soil around the buildings is a REC.

5.7 Suspected Termiticides in Soil

Based on the age of construction of school buildings, in accordance with California DTSC guidelines, the suspected presence of organochlorine pesticides (OCPs) in shallow soil around building foundations would be considered a REC.

5.8 Suspected Arsenic in Soil

Prior to 1980, it was a common practice for the District to apply herbicides containing arsenic to soil prior to placing asphaltic concrete (AC) pavement. Based on the age of the AC pavement at the site, the suspected presence of arsenic underneath said pavement would be considered a REC.

5.9 Lead in Drinking Water

According to the 2016 LADWP Annual Water Quality Report, lead in drinking water met the primary drinking water standards and therefore, is not considered a concern.

5.10 Methane

According to the ZIMAS website (ZIMAS, 2017), the site does not lie within a methane zone or methane buffer zone.

5.11 Traffic Noise

According to the CDE School Site Selection and Approval Guide (CDE, 2000), the California Department of Transportation considered sound at 50 decibels in the vicinity of schools to be the point at which it will take corrective action for noise generated by freeways. The nearest freeway is United States Route 101, approximately 1.2 miles south of the site. Based on the distance of the nearest freeway, traffic noise would not be considered a concern.

5.12 Faults

According to the ZIMAS website, the nearest fault is the Northridge fault, approximately 11.14 kilometers (6.9 miles) from the site. The site is not within an Alquist-Priolo Fault Zone.

5.13 Flooding or Inundation Area

According to the Safety Element of the Los Angeles City General Plan (City of Los Angeles, 1996), the east-southeast portion of the site is in a potential inundation area; however, the site is not in an area potentially impacted by a tsunami. According to the Safety Element and EDR Radius Report, the southern edge of the site is within the 100-year flood zone.

5.14 Liquefaction and Landslides

According to the ZIMAS website, the site is not near landslide; however, it is in a liquefaction zone.

5.15 Compatible Zoning

According to the ZIMAS website, the site vicinity is zoned to be in the River Improvement Overlay District consisting of primarily residential properties, with some commercial properties to the south of the site.

5.16 Light, Wind, and Air Pollution

Ninyo & Moore reviewed lightpollutionmap.info, which provides radiance measurements from less than 0.25 to over 40.0 x 10^{-9} watts per steradian per square centimeter (W/sr/cm^2). Data is provided by the Earth Observation Group and National Oceanic and Atmospheric Administration National Geophysical Data Center. According to the website, the site has a radiance of approximately 30.8 x 10^{-9} W/sr/cm^2.

According to the wind finder website (windfinder.com), wind statistics were available for the Van Nuys Airport, approximately 1.88 nautical miles to the northeast of the site. The average wind direction for the previous 12 months was to the northwest, and the average wind speed was 7 miles per hour.

Ninyo & Moore reviewed the historical air quality data from 2014 available from SCAQMD for the West San Fernando Valley Region. According to the SCAQMD, measurements for carbon monoxide, ozone, and nitrogen dioxide did not exceed SCAQMD maximums in 2014 (SCAQMD, 2014). The site is not listed on the District's Priority List of Schools Most at Risk from Air Pollution (Los Angeles Unified School District [LAUSD], 2008).

Since the site is an existing school, this information would not be considered a concern.

5.17 Easements

Easements restricting access or building placement were not found on the ZIMAS website.

5.18 Border Zone Property

Based on the site reconnaissance and information provided by EDR, the site is not located within 2,000 feet of a significant disposal of hazardous waste facility.

5.19 Cellular Phone Towers

According to the MapMuse website (http://find.mapmuse.com/map/cell-towers), cellular phone towers are not on or adjacent to the site.

6 VAPOR ENCROACHMENT/INTRUSION

The purpose of the preliminary vapor encroachment screen is to identify a vapor encroachment condition (VEC), which is the presence or likely presence of potential contaminants of concern (COC) vapors in subsurface soils at the site caused by the release of vapors from contaminated soil or groundwater either on or near the site. The potential for VECs beneath the site was evaluated using a Vapor Encroachment Screening Matrix (VESM) in accordance with ASTM E 2600-15 Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions. The VESM included performing a Search Distance Test to identify if there are any known or suspect contaminated properties surrounding or upgradient of the site within specific search radii, a COC Test (for those known or suspect contaminated sites identified within the Search Distance Test) to evaluate whether or not COCs are likely to be present, and a Critical Distance Test to evaluate whether or not COCs in a contaminated plume may be within the critical distance of the site (100 feet for non-petroleum hydrocarbon contaminants and 30 feet for petroleum hydrocarbon contaminants).

Based on the VESM and presence of a clarifier and historic spray paint booths on-site, a VEC cannot be ruled out. A copy of the VESM is included in Appendix F.

7 INTERVIEWS

Ninyo & Moore interviewed Mr. Diego Serrano, Plant Manager at Reseda High School. Mr. Serrrano indicated that they did not have knowledge of above or underground storage tanks or water treatment on the site. On-site hazardous waste storage, clarifiers, and other site observations are discussed in Section 4.4.

8 FINDINGS

Based upon the results of this Phase I ESA, the following findings are provided.

- The site consists of an approximately 29.5-acre parcel located at the southwest corner of the intersection of Kittridge Street and Lindley Avenue.
- At the time of the site reconnaissance, the site was developed with sixteen permanent and several portable buildings, athletic fields, and playground areas.
- One pad-mounted electrical transformer was observed within an electrical enclosure located south of the Industrial Arts building. Leaks or stains were not observed in the vicinity of the transformer. One inactive three-stage clarifier was observed adjacent to the south of the Industrial Arts building. The clarifier was associated with the former automotive shop. A grease trap was observed in the kitchen area of the Cafeteria building. A catch basin was observed in the ceramics classroom in the Science building. One brick incinerator (currently not in use) that was formerly used to burn trash was observed at the southwest side of the Utility building. The topography at the site is generally flat and in the site vicinity slopes to the east-southeast.

- Based on a review of historical resources, the site consisted of agricultural land (with some structures in the northeast corner from the 1920s to the 1940s) from the 1920s to 1954/1955, when the site was first developed with the current school buildings/ improvements.

- The site was listed in the HAZNET, RCRA-LQG, ECHO, and FINDS databases as a large quantity generator of lead in 2008. Various hazardous wastes were removed from the site from 1993 to 2013, including household waste, laboratory waste chemicals, other inorganic solid waste, asbestos containing waste, other organic solids, alkaline solution without metals pH>=12.5, off-specification, aged or surplus organics, and waste oil and mixed oil. Violations were not reported for these site listings.

- According to SCAQMD records, LAUSD, Reseda High School was issued inactive permits for boilers and an inactive permit for two spray paint booths in 1964. Notices of violation or notices to comply were not issued for the site. Boilers and/or spray paint booths were not observed during Ninyo & Moore's site reconnaissance.

- Properties of potential concern in the site vicinity were researched and were not found to have the potential to adversely impact the site.

- Based on the completion of the VESM, a VEC was not found.

9 OPINIONS

The rationale for concluding whether the conditions listed in Section 8, above, represent RECs, HRECs, or CRECs (i.e., the presence or likely presence of hazardous substances or petroleum products on a property under conditions indicative of releases, past releases, or a material threat of a release of hazardous substances, pollutants, contaminants, and/or petroleum/petroleum products at the site) is provided below.

9.1 Data Gaps

Significant data gap that would affect the ability of the environmental professional to evaluate conditions indicative of releases or threatened releases were not encountered.

9.2 Additional Appropriate Investigation

It is our opinion that additional appropriate investigation to evaluate RECs at the site should be conducted.

10 CONCLUSIONS

We have performed a Phase I ESA, in conformance with the scope and limitations of the ASTM Practice E 1527-13, of the property located at 18230 Kittridge Street, Reseda, California. Any exceptions to, or deletions from, this practice are described in Section 1.4 and in the body of this report. This assessment has revealed the following RECs in connection with the site:

- The former agricultural use of the site with some structures in the northeast portion of the site.
- One inactive clarifier associated with the former automotive shop adjacent to the south of the Industrial Arts building (including a potential vapor encroachment condition).
- The former presence of spray paint booths on-site (including a potential vapor encroachment condition) based on the potential for releases from former leaks.
- Based on the former use of the incinerator to burn solid wastes, the likely presence of burnt material surrounding the incinerator.
- Based on the age of the current site buildings, persistent termiticides (organochlorine pesticides or OCPs) and lead (from LBP) may be present in shallow soil around building foundations.
- Polychlorinated biphenyl (PCB)-containing materials may be present from the on-site pad mounted transformer installed prior to 1979.
- Arsenic in shallow soil underneath AC pavement may be present due to the LAUSD's former standard practice of applying herbicides containing this metal prior to paving.
- Based on the results of the VESM and information obtained during this Phase I ESA, a VEC cannot be ruled out beneath the site.

11 RECOMMENDATIONS

Based on the findings of the Phase I ESA, additional environmental assessment is recommended for the site, as discussed below:

- In locations of future construction, the possible presence of PCBs, OCPs, arsenic, and lead in shallow soil at the site should be assessed in the form of a Preliminary Environmental Assessment-Equivalent and in general accordance with California Department of Toxic Substances Control (DTSC) guidance documents (DTSC, 2002, 2003, and 2006).
- If construction or demolition activities are planned for buildings near the inactive clarifier, former spray booths, or incinerator, soil and soil vapor should be evaluated to determine the extent of site contamination, if any.

13 PROFESSIONAL STATEMENT

As required by 40 CFR §312.21(d) and Section 12.13 of ASTM 1527-13, the following statement is included:

> *I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined by §312.10 of 40 CFR 312. I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.*

Anthony Lizzi
Principal Geologist

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 12/12/2016 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
NEWCASTLE AVENUE ELE	6520 NEWCASTLE AVE	ENE 1/8 - 1/4 (0.135 mi.)	14	24

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 12/12/2016 has revealed that there are 3 RCRA-SQG sites within approximately 0.25 miles of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 01/30/2017 has revealed that there are 4 ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Integrated Waste Management Board's Solid Waste Information System (SWIS) database.

A review of the SWF/LF list, as provided by EDR, has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 3 SWEEPS UST sites within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there is 1 EDR Hist Auto

site within approximately 0.125 miles of the target property.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110008271985

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

RESEDA DODGE (Continued) **1000201314**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002636265

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Document Type: Phase 1
Completed Date: 10/18/2002
Comments: Pursuant to the MOU, DTSC has reviewed a Phase I Environmental Site Assessment Report and other documents for the Los Angeles Jewish Home for the Aging (LAJHA). The subject property, Eisenberg Village, is a skilled nursing and residential care facility. LAJHA has recently constructed a new building on the subject property which is being proposed for insurance by Cal-Mortgage. A Supplemental Phase I Environmental Assessment Report was prepared by DTSC and concluded that no action was needed for this property; there is no contamination on the property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/05/2017

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 04/05/2017

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 12/12/2016

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

SCRD DRYCLEANERS: State Coalition for Remediation of Drycleaners Listing

The State Coalition for Remediation of Drycleaners was established in 1998, with support from the U.S. EPA Office of Superfund Remediation and Technology Innovation. It is comprised of representatives of states with established drycleaner remediation programs. Currently the member states are Alabama, Connecticut, Florida, Illinois, Kansas, Minnesota, Missouri, North Carolina, Oregon, South Carolina, Tennessee, Texas, and Wisconsin.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 07/30/2013
Date Data Arrived at EDR: 08/19/2013
Date Made Active in Reports: 10/03/2013

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

RESEDA HIGH SCHOOL
18230 KITTRIDGE STREET
RESEDA, CA 91335

TARGET PROPERTY COORDINATES

Latitude (North):	34.188711 - 34° 11' 19.36''
Longitude (West):	118.529365 - 118° 31' 45.71''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	359070.1
UTM Y (Meters):	3783942.2
Elevation:	729 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5630737 CANOGA PARK, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

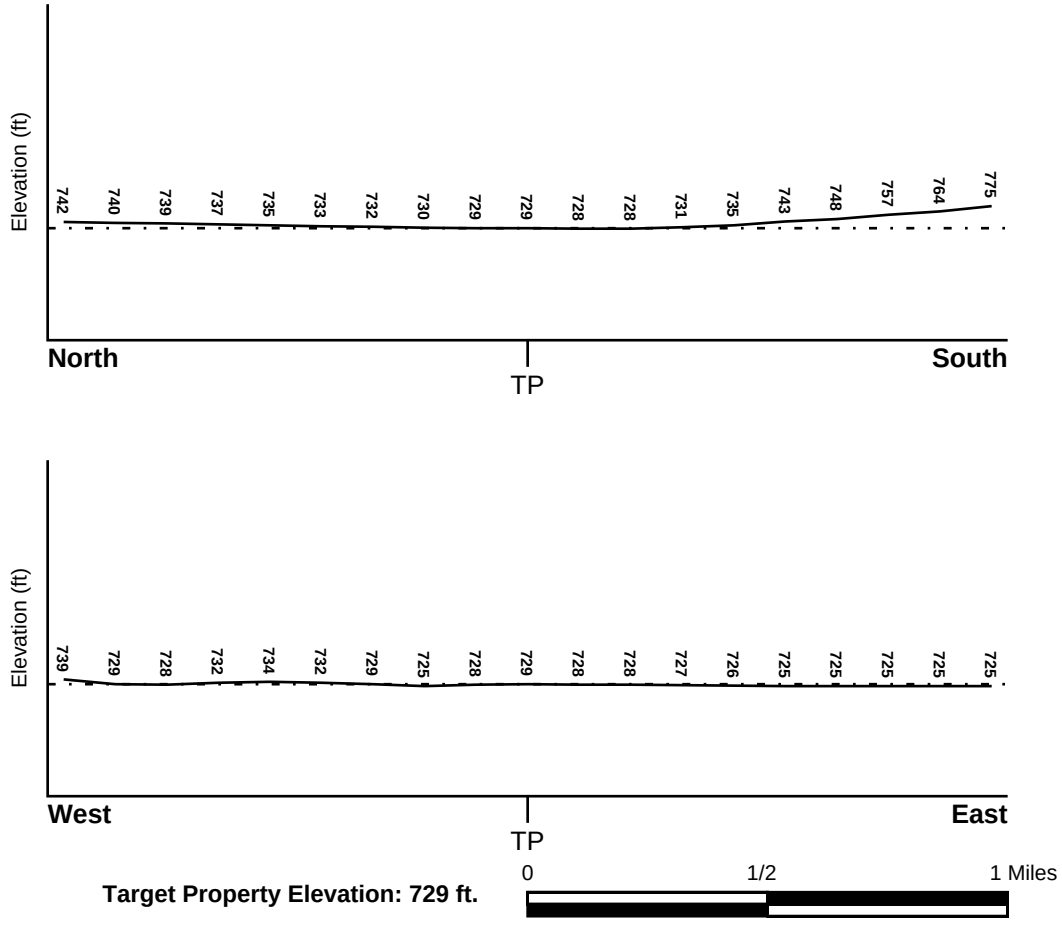
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06037C1285F	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06037C1295F	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CANOGA PARK	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: Mocho

Soil Surface Texture: loam

Hydrologic Group: Not reported

Soil Drainage Class:
Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	16 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 7.9
2	16 inches	75 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 14 Min: 4	Max: 8.4 Min: 7.9

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

Contact: Manasi Chavan

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Search Results:

Year	Scale	Details	Source

Contact: Manasi Chavan

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Ninyo & Moore were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # 6329-4D24-AE6D

PO # 210095004

Project 210095004

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 6329-4D24-AE6D

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Ninyo & Moore (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

EDR® Environmental Data Resources Inc

BUILD FAX PROPERTY HISTORY

EXECUTIVE SUMMARY: SEARCH DOCUMENTATION

A search of building department records was conducted by Environmental Data Resources, Inc (EDR) on behalf of Ninyo & Moore on Jun 19, 2017.

TARGET PROPERTY

18230 Kittridge Street
Reseda, CA 91335

SEARCH METHODS

EDR searches available lists for both the Target Property and Surrounding Properties.

RESEARCH SUMMARY

Building permits identified: **YES**

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

Status:	
Valuation:	$0.00
Contractor Company:	
Contractor Name:	WILLIAMS BROTHERS PLUMBING INC

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use(s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Sample Building Permit Data

Date: Nov 09, 2000
Permit Type: Bldg -
New Permit Number: 101000000405
Status: Valuation: $1,000,000.00
Contractor Company: OWNER-BUILDER
Contractor Name:

Description: New one store retail (SAV-ON) with drive-thru pharmacy. Certificate of Occupancy.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR Property Tax Map Report

Environmental Data Resources, Inc.'s EDR Property Tax Map Report is designed to assist environmental professionals in evaluating potential environmental conditions on a target property by understanding property boundaries and other characteristics. The report includes a search of available property tax maps, which include information on boundaries for the target property and neighboring properties, addresses, parcel identification numbers, as well as other data typically used in property location and identification.

Thank you for your business.

Office of Environmental Health & Safety Checklist

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Reseda High School

Selection Criteria	Yes	No	Comments
Powerlines/Electromagnetic Fields [CCR, Title 5, 14010(c)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from 50-133 kV powerlines/electromagnetic fields within 100 feet of the site?		X	Per EDR.
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from 220-230 kV powerlines/electromagnetic fields within 150 feet of the site?		X	Per EDR
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from 500-550 kV powerlines/electromagnetic fields within 350 feet of the site?		X	Per EDR
Railroads [CCR, Title 5, 14010(d)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from railroads within 1,500 feet of the site?		X	Per Quadrangle Canoga Park topographic map
Traffic Noise [CCR, Title 5, 14010(e)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from adjacent roads or freeways that will adversely affect the educational program?		X	Per Quadrangle Canoga Park topographic map
Faults [CCR, Title 5, 14010(f)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an active earthquake fault or fault trace which may be onsite?		X	Per ZIMAS
Flood or Inundation Area [CCR, Title 5, 14010(g)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from flooding or dam inundation?		X	Per ZIMAS
Pipelines and Above Ground Tanks [CCR, Title 5, 14010(h)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from nearby above-ground water or fuel storage tanks?		X	Per LADWP
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from above-ground or underground pipelines located within 1,500 feet of the site?		X	Per NPMS and Gas Company
Liquefaction and Landslides [CCR, Title 5, 14010(i)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from liquefaction or landslides?		X	Per ZIMAS
Traffic and Pedestrian Safety [CCR, Title 5, 14010(l)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an adjacent major arterial street?		X	

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Reseda High School

Selection Criteria	Yes	No	Comments
Compatible Zoning [CCR, Title 5, 14010(m)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from the zoning surrounding the site?		X	Per ZIMAS
Light, Wind, Air Pollution [CCR, Title 5, 14010(q)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from light, wind or air pollution?		X	Per lightpollutionmap.info, windfinder.com, and SCAQMD
Easements [CCR, Title 5, 14010(r)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from easements on or adjacent to the site which may restrict access or building placement?		X	Per ZIMAS
Border Zone Property [CCR, Title 5, 14010(t)]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a significant disposal of hazardous waste within 2,000 ft. of the site?		X	Per site reconnaissance and EDR
Cellular Phone Towers [LAUSD Board Resolution]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a cellular phone tower on or adjacent to the site?		X	Per MapMuse
Air Pollution [LAUSD Board Resolution]			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a major transportation corridor (freeway, major rail line) within 500 feet?		X	Per Quadrangle Canoga Park topographic map
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a major stationary source of emissions within 500 feet?		X	Per SCAQMD
Is the school on the Priority List of Schools Most at Risk from Air Pollution?		X	Per District
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a high-risk facility previously identified by OEHS?		X	No previously identified high-risk facilities by OEHS
Methane Zone			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from a known methane zone or oil field?		X	Per ZIMAS
Oil Wells			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an onsite oil well?		X	Per DOGGR
Airports			
Will the project create any new significant safety hazards or exacerbate any existing safety hazards to students from an airport within two nautical miles of the site?		X	Per Quadrangle Canoga Park topographic map

APPENDIX F

Vapor Encroachment Screening Matrix

Phase I ESA Vapor Encroachment Conditions (VEC) matrix includes a (1) Search Radius Test, (2) Chemicals of Concern Test (COC), and (3) a Critical Distance Test [1].

(1) Search Radius Test: Are there any known or suspect contaminated properties in the primary area of concern within the corresponding search radii?

☒ Yes ☐ No — If ***No***, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If ***Yes***, then:

(2) Chemicals of Concern Test: Are COC likely to be present within the area of concern for those known or suspect contaminated sites identified based on the Search Distance Test?

☒ Yes ☐ No — If ***No***, then screening for a VEC is complete and no VEC *currently* exists, go to #4. If ***Yes***, then:

(3) Critical Distance Test: A plume test to determine whether or not COC in the contaminated plume(s) may be within the critical distance.

☒ Yes ☐ No — (3a) Is information related to the contaminated(s) plume available (i.e., isoconcentration maps, site drawings, etc.)?

(3b) If ***No***, then a VEC cannot be ruled out; check ***Yes*** in #4 below indicating it is likely a VEC exists. If ***Yes***, then:

☐ Yes ☒ No — (3c) Is the site less than 100 feet to the nearest edge of a contaminated [non-petroleum hydrocarbon] plume(s)? If ***Yes***, then check ***Yes*** in #4 below indicating it is likely a VEC exists.

☐ Yes ☒ No — (3d) Is the site less than 30 feet to the nearest edge of a dissolved petroleum hydrocarbon plume(s)? If ***Yes***, then check ***Yes*** in #4 below indicating it is likely a VEC exists.

If the distance from the nearest edge of a contaminated plume to the nearest existing or planned structure on the site is less than 100 feet for non-petroleum hydrocarbon COC, or less than 30 feet for dissolved petroleum hydrocarbons, then it is presumed that a VEC *currently* exists beneath the site. If the distance from the nearest edge of the contaminated plume is greater than or equal to 100 feet for non-petroleum hydrocarbons, or 30 feet for dissolved petroleum hydrocarbon chemicals of concern, then it is presumed unlikely that a VEC *currently* exists beneath the site.

(4) Is it likely that a VEC *currently* exists beneath the site?

☐ Yes ☒ No — If ***No***, then the VEC screening is complete and no further investigation is recommended at this time. If ***Yes,*** Ninyo & Moore recommends performing additional assessment, such as a Tier 2 VEC assessment according to ASTM E 2600-15.

[1] Based on guidance presented in the ASTM E 2600-15 Standard.

Qualification of the Environmental Professionals

ANTHONY J. LIZZI, PG, CHG

TECHNICAL ADVISOR/PRINCIPAL GEOLOGIST

EDUCATION

MS, Geology (Hydrogeology), 2007, California State University, Fullerton

BS, Geology, 1986, Concordia University

Pure and Applied Sciences, 1984, Vanier College

REGISTRATIONS AND CERTIFICATIONS

PG 7328 (California)

CHG 799 (California)

Hazardous Materials Management

OSHA

SARA

EXPERIENCE HIGHLIGHTS

Environmental Assessments for Schools

Soil and Groundwater Remediation

Supplemental Site Investigations

Preliminary Environmental Assessments

PCB investigations per TSCA (40 CFR 761)

Landfill and Waste Industries Site Assessments

Underground Storage Tank Program Management

Phase I and Phase II Site Investigations

Mr. Anthony Lizzi is a registered geologist and certified hydrogeologist with a professional career that spans more than 27 years in the areas of site assessment and remediation and groundwater resource analysis. He is an experienced geologist specializing in conducting soil and groundwater investigations of complex sites impacted by soil, soil gas and groundwater contamination, implementing soil and groundwater remediation, preparation and implementation of soil removal/remedial action, and groundwater resource analysis. Mr. Lizzi is responsible for senior technical review of all environmental soil and groundwater documents. As a program manager, he is also experienced in interacting with regulatory agencies (city, county, state agencies [SWRCB and DTSC]) on behalf of clients to assist the agencies to understand the type of impact, and full extent of the contaminant release to expedite the approval of remedial plans, cleanup process and obtain a no further action letter.

REPRESENTATIVE CAREER EXPERIENCE

Former Dry Cleaners, Soil Vapor Extraction Tests, Los Angeles Basin, California: Conducted numerous SVE tests for current and former dry cleaner operations to determine whether PCE had been released to the subsurface. Collected soil gas and soil matrix samples for chlorinated hydrocarbons (PCE and TCE). Remediated PCE-impacted soil using an internal combustion engine operated SVE system in vapor wells down to 70 feet below grade. Used the SVE data to calculate effective radius of influence, intrinsic soil permeability, and projected duration of the cleanup effort.

Former Fuel Service Stations, Dual Phase Extraction Remediation, Los Angeles Basin, California: Principal Geologist conducted many dual phase extraction (DPE) tests to evaluate the viability of vacuum enhancement as a means of increasing liquid production rates from low-permeability soils. DPE remediation were conducted using a high vacuum pressure and high flow pumping system on groundwater monitoring wells at various fuel service stations in Los Angeles County and Orange County. Results of the tests were used for the design of in situ remediation systems to address LNAPL floating on groundwater, dissolved constituents within the groundwater, and volatiles within the vadose zone. Recovered impacted groundwater was pumped in aboveground polytanks whereas the soil vapors were extracted into 55-gallon granular activated carbon (GAC) drums. Mr. Lizzi also obtained site closure for most sites.

Shell Oil, Soil and Groundwater Remediation, Los Angeles, California: Project manager for field program that included the installation of 15 groundwater monitoring wells, 18 soil vapor extraction wells, and four dual completion air sparge and vapor wells at a former gas station in which free-product has migrated more than 250 feet downgradient of the site. Managed design and implementation of multiphase remediation in accordance with the Los Angeles Regional Water Control Board requirements. Provided oversight of funding and expenditures, compliance with contracted scope of work, preparation of cost estimates and contract modifications, and maintained routine communication with LARWQCB personnel.

State of California Department of General Services, Phase II Subsurface Investigation, Hollywood, California: Project manager for a Phase II subsurface investigation at a downtown parcel to assess recognized environmental conditions. Managing development of a field sampling and analysis program to evaluate the nature of any hazardous materials or substances that may be present in soil, soil gas, and groundwater at the subject site.

Air Products and Chemicals, Soil Vapor Extraction Pilot Testing, Vernon, California: Conducted numerous pilot-scale SVE tests to evaluate the technology's applicability at sites with petroleum and chlorinated hydrocarbons. Analyzed test data. Obtained site closure from the Vernon Fire Department.

REPRESENTATIVE CAREER EXPERIENCE (continued)

Port of Long Beach, On-Call Environmental Consulting Services Contract: Under the new, three-year-term contract, Mr. Lizzi is the Principal Geologist for the environmental services being performed in the areas of, but not limited to, identification of hazardous materials used in the construction of buildings and appurtenance, including, but not limited to, asbestos, PCBs, and lead-based paint, or stored within or outside of any facilities; physical and chemical sampling and analyses for detection and delineation of surface and subsurface contamination of soil and groundwater; and small scale removal and/or abatement of asbestos-containing materials and lead-based paint from structures scheduled for demolition or renovation.

Los Angeles World Airports (LAWA), Los Angeles International Airport (LAX), Pedestrian Tunnel Between Terminals 6 & 7 Historical Environmental Reports Review, Los Angeles, California: Principal Geologist retained for reviewing historical environmental soil, air and groundwater reports and analytical data obtained for the pedestrian tunnel with respect to health risk assessment issues. The investigations were conducted to determine whether the subsurface conditions have been impacted with petroleum hydrocarbons resulting from site operations at LAX facilities (underground fuel pipelines). The focus of the review was on factors that would have been or likely to impinge on enhancement or mitigation of exposures relative to reasonably complete exposure pathways involving occupational and visitor/pedestrian receptors.

Various Clients, Underground Storage Tank Program Management, Various Service Station Sites, California: Program manager for multiple service station sites, consisting of site investigations, installing groundwater and remediation wells, soil vapor extraction system pilot-testing, full-scale system design and installation, remediation system operations and maintenance, and preparation of work plans and reports. Projects were completed as part of the California UST Fund reimbursement program.

Los Angeles Unified School District (LAUSD), Carson Gore Academy, Soil and Groundwater Remediation, Los Angeles, California: In 2013, Project Manager for the Soil Remediation and Environmental Monitoring of two large soil excavations as part of the DTSC-approved remedial action plan to excavate VOC- and TPH-impacted soil down to approximately 45 feet below ground surface (bgs), totaling approximately 20,000 cubic yards. Due to the depth of the excavation and proximity to adjacent private and public right-of-ways, an engineered shoring system was constructed. Project tasks involved oversight of the shoring system installation of soldier pile and board-lagging techniques; supervision of the application of Liquid Boot® along the eastern shoring wall of excavation to approximately 5 feet bgs to prevent potential off-site VOC impacts from migrating onto the site and of the application of BIOX® on the bottom of excavation in the capillary fringe area to address the residual impact; and oversight of the post-excavation soil sampling to confirm that the cleanup goals were met, as well as supervised the quarterly sampling of soil gas and groundwater monitoring wells under DTSC oversight and the soil vapor extraction (SVE) well installation and pilot tests to determine radius of influence and level of vacuum response. Also oversaw the sampling of indoor air in the four buildings to determine the potential presence of tetrachloroethene (PCE) and its degradation products and determine whether there was any difference between the indoor air and outdoor air sampling results; performed senior review of environmental technical documents; and obtained no further action letter from DTSC.

Los Angeles Department of Water and Power (LADWP), On-Call Environmental Consulting Services Contract Los Angeles, California: Principal Geologist for environmental projects for this on-call contract at various sites throughout the LADWP footprint. Reviewed Phase I ESA reports on numerous sites in Southern California ranging from vacant, undeveloped land to industrial properties. Managed the Phase II field activities at numerous LADWP sites for soil, soil gas, and groundwater investigations. Performed senior review of technical documents.

Former Fuel Service Stations, Dual Phase Extraction Remediation, Los Angeles Basin, California: Conducted many dual extraction tests to evaluate the viability of vacuum enhancement as a means of increasing liquid production rates from low-permeability soils. DPE remediation were conducted using a high vacuum pressure and high flow pumping system on groundwater monitoring wells at various fuel service stations in Los Angeles and Orange counties. Results of the tests were used for the design of in situ remediation systems to address nonaqueous phase liquid hydrocarbon floating on groundwater, dissolved constituents within the groundwater, and volatiles within the vadose zone. Recovered impacted groundwater was pumped in aboveground polytanks whereas the soil vapors were extracted into 55-gallon granular activated carbon (GAC) drums. Obtained site closure for most sites.

PATRICK CULLIP, EIT

TASK LEADER: FACILITIES ENGINEERING

EDUCATION

B.S. Mechanical Engineering, Loyola Marymount University, Los Angeles

REGISTRATIONS AND CERTIFICATIONS

Loss Prevention System (LPS)
OSHA HAZWOPER with annual 8-hour refreshers
OSHA HAZWOPER Site Supervisor Training
OSHA Excavation Competent Person Certification
First Aid and CPR Training
BNSF Contractor Orientation Safety certified

EXPERIENCE HIGHLIGHTS

Phase I Environmental Site Assessments
Sampling Surveys
1166 Soil Monitoring
Preliminary Environmental Assessment

Mr. Patrick Cullip has over three years experience performing environmental remediation, operations and maintenance (O&M), remediation system installation, groundwater/soil vapor sampling, well installation, underground storage tank (UST) removal, soil contamination removal, dual-phase extractions, aerially-deposited lead (ADL) sampling, geological and geotechnical logging, quarterly groundwater monitoring reports, pilot test reports, design, and oversight projects; conducting environmental site assessments (ESAs) and feasibility testing; and evaluating regulatory compliance.

REPRESENTATIVE PROJECT EXPERIENCE

Port of Los Angeles, Wilmington, California: Senior Staff Environmental Engineer, conducted groundwater monitoring on numerous existing monitoring wells, using hand bailers.

Long Beach Unified School District, Long Beach, California: Senior Staff Environmental Engineer, collected soil samples using hand-auger and direct-push methods, to assess lead and pesticide contamination from lead based paint and termiticides along the edges of classroom and administrative buildings at Jordan High School, and prepared reports for government agencies. Sample results were used to determine the extent of contamination and potential associated health risks to field personnel participating in planned remodeling/demolition activities. Prepared the preliminary environmental assessment (PEA) report for sampling and associated remedial action work plan (RAW) for required soil remediation.

City of Los Angeles, Temescal Canyon Park Storm Water Project, Pacific Palisades, California: Senior Staff Environmental Engineer, conducted South Coast Air Quality Management District Rule 1166 air monitoring of soil being excavated for future storm water holding tank. The soil consists of undocumented fill found to contain petroleum hydrocarbons.

Caltrans, Various Locations, Southern California: Senior Staff Environmental Engineer, collected soil samples, using hand-auger methods, of roadside soils to assess aerially deposited lead (ADL) impacts of soil from years of contamination from leaded gasoline. Sample results were used to determine the waste classification for proper disposal and handling of road and highways improvements.

Phase I ESAs – Various Sites, Southern California: Field Manager, performed numerous Phase I ESAs of commercial, industrial, and residential properties throughout Southern California for various financial institutions, land developers, and government agencies. The Phase I ESAs included reviewing regulatory files of various government agencies to evaluate the extent and type of impacts at sites, conducting site walks and owner/operator interviews, and preparing reports.

Los Angeles Unified School District (LAUSD), Los Angeles, California: Oversaw groundwater/soil vapor extraction tests at various sites to determine extent of contamination. Field Manager for a complex site excavation for future school; tasks included lead/hydrocarbon soil testing, hazardous/non-hazardous soil removal, and air quality monitoring. Directed cleaning/removal of USTs, soil contamination chase-out, and removal. Supervised installation of groundwater/soil vapor monitoring wells. Directed maintenance on groundwater/soil vapor systems. Organized, managed, and operated numerous dual-phase extraction tests to remove site contaminants. Executed various O&M visits for existing soil vapor and groundwater remediation systems. Tracked effluent readings for various sites to ensure permitting compliance. Prepared dozens of environmental reports including quarterly groundwater monitoring reports, pilot tests, site assessments, remedial action plans, and RECAPs.

EXECUTIVE SUMMARY

This document presents the results of a *Preliminary Endangerment Assessment – Equivalent Report* (Report) conducted in support of a Comprehensive Modernization Project (CMP) for the Los Angeles Unified School District's (LAUSD) Reseda High School (Site). This report has been prepared for LAUSD to present a summary of the sampling and analysis activities conducted for the proposed CMP on the school campus, located at 18230 Kittridge Street, Reseda, California.

The Preliminary Endangerment Assessment-Equivalent (PEA-E) was conducted to assess environmental conditions at selected areas within the CMP footprint, identified by Ninyo & Moore's Phase 1 conducted in 2017, prior to the beginning of demolition, modernization and construction activities. Ninyo & Moore identified existing Recognized Environmental Conditions (RECs), historical RECs and controlled RECs at the Site. The PEA-E was conducted in accordance with the PEA-E Work Plan (Work Plan) that was prepared by Ninyo & Moore on behalf of LAUSD. It was also conducted in accordance with applicable regulatory guidance, including the *Preliminary Environmental Assessment Guidance Manual* prepared by the California Department of Toxic Substances Control (DTSC).

The Work Plan identified the following five areas of concern (AOCs);

- AOC1 - Lead-based paint, OCPs and PCBs may be present in shallow soil based on the age of the current site buildings. Arsenic may be present in shallow soil due to LAUSD's former standard practice of applying herbicides for weed control containing metal prior to paving.
- AOC2 - Potential impacts in shallow soil from PCBs near the on-site pad-mounted transformer that was installed prior to 1979.
- AOC3 - Potential impacts in shallow soil from dioxins and furans near the existing (inactive) incinerator that was previously used to burn solid waste.
- AOC4 – Potential impacts in soil from TPH, metals, PCBs and VOCs near the inactive clarifier associated with the former automotive shop adjacent to the Industrial Arts Building. Evaluate potential impacts in soil vapor from VOCs near the clarifier.
- AOC5 – Potential impacts in soil vapor from VOCs near the suspected location of historical spray paint booths.

At AOC1, soil from 107 initial boring locations was analyzed for lead and arsenic to a maximum depth of 3.5-feet (ft) below ground surface (bgs). Soil from 10% of the initial borings at 0.5-ft bgs was analyzed for PCBs. Soil samples from 0.5-ft bgs were composited by the analytical laboratory and analyzed for OCPs. Each sample was a composite of soil from 0.5 ft bgs in four to six adjacent borings or borings surrounding a building. Based on the analytical results ninety-two step-out borings to a maximum depth of 3.5-ft bgs were completed to delineate arsenic exceedances and

four step-out borings to a maximum depth of 2.5-ft bgs were completed to delineate lead exceedances in soil.

At AOC2, soil from two borings was analyzed for PCBs to a maximum depth of 0.5-ft bgs.

At AOC3, soil from one boring was analyzed for dioxins and furans to a maximum depth of 0.5-ft bgs.

At AOC4, soil from two initial boring locations was analyzed for VOCs, TPH, PCBs, and Title 22 Metals to a maximum depth of 5-ft bgs. Soil vapor probes were installed and analyzed for VOCs at 5- and 15-ft bgs at the two initial boring locations. Based on the soil vapor analytical results soil vapor probes were installed and sampled for VOCs at 5- and 15-ft bgs at eleven step-out boring locations to delineate PCE. Three sub-slab soil vapor probes were also installed within the western portion of the industrial arts building to evaluate VOCs immediately beneath the foundation slab.

At AOC5 soil vapor probes were installed at 5- and 15-ft bgs at two boring locations. The soil vapor probes were sampled and analyzed for VOCs.

The following conclusions were derived from the soil and soil vapor sampling and analyses conducted at the Reseda High School:

- PCBs were not detected above their respective laboratory reporting limits in any of the soil or soil vapor samples analyzed. Therefore, PCBs are not considered a Site chemical of concern (COC).
- Five OCPs (4,4'-DDD, 4,4'-DDE, 4,4'-DDT, chlordane, and dieldrin) were detected above their respective reporting limits in one or more composite soil samples. OCP concentrations were all below preliminary screening levels (PSLs); therefore, OCPs are not considered Site COCs.
- The measured concentrations of dioxins/furans in the soil samples did not exceed PSLs. Therefore, dioxins and furans are not considered a Site CoC.
- TPH-g and TPH-d were not detected in the soil samples collected at the Site. TPH-o was detected above the laboratory reporting limit in eleven soil samples but was below the PSLs. Therefore, TPHs are not considered Site COCs.
- Title 22 metals were below PSLs except for arsenic and lead.
- Lead results from soil samples collected in the proposed development areas are below the PSL (80 mg/kg) in 103 of the 107 initial boring locations. The highest exceedance of lead was 170 mg/kg at location AOC1-B6 at 0.5 ft bgs. Step-down and lateral step-out sampling was conducted until the detected lead concentrations were less than the PSL of 80 mg/kg, a building foundation was reached, access was limited, or a subsurface utility was encountered.
- Arsenic results from soil samples collected in the proposed development area are below the PSL (12 mg/kg) in 95 of the 107 initial boring locations. The highest exceedance of

arsenic at the initial sample locations was 32 mg/kg at AOC1-B10 at 0.5-ft bgs. Step-down and lateral step-out sampling was conducted until the detected arsenic concentrations were less than the PSL of 12 mg/kg, a building foundation was reached, access was limited, or a subsurface utility was encountered.

- An estimated 266 cubic yards of soil are impacted by lead and/or arsenic based on the results of the field investigation. Approximately 261 cubic yards can be managed as non-hazardous waste and approximately 5 cubic yards can be managed as non-RCRA hazardous waste.
- PCE was detected above the current PSL in soil vapor at 5- and 15-ft bgs at AOC4-SV1, AOC4-SV3, AOC4-SV4, AOC4-SV8, AOC4-SV10 and AOC4-SV11. PCE was detected above the current PSL in soil vapor at sub-slab locations AOC4-SS1, AOC4-SS2 and AOC4-SS3. The elevated PCE soil-vapor impact has been delineated to the west by AOC4-SV6 and AOC4-SV9; to the east by AOC4-SV5; to the south by AOC4-SV12, and; to the north by AOC4-SV13. PCE in soil vapor is likely to represent a potential risk at the Site.
- Benzene was detected above the current PSL in soil vapor at 15-ft bgs at AOC4-SV12, but benzene was not detected in the 5 ft bgs sample at the same location. This likely indicates that benzene is degrading as it migrates through the soil column and that benzene in soil vapor at AOC4-SV12 does not represent a potential risk. Benzene was detected above the current PSL in soil vapor at sub-slab locations AOC4-SS1, AOC4-SS2 and AOC4-SS3. Overall, benzene in sub-slab soil vapor at the Site does indeed exceed PSLs but is only likely to represent a slight risk above background exposures.

The following are recommendations based on the above conclusions:

- A Removal Action Workplan (RAW) should be developed for the Site to address shallow soils impacted with lead and/or arsenic.
- The RAW should also address PCE and benzene soil vapor impacts above the current PSLs.

1.0 INTRODUCTION

This document presents the results of a *Preliminary Endangerment Assessment – Equivalent Report* (Report) conducted in support of a Comprehensive Modernization Project (CMP) for the Los Angeles Unified School District's (LAUSD) Reseda High School (Site). This report has been prepared for LAUSD to present a summary of the sampling and analyses activities conducted for the proposed CMP on the school campus, located at 18230 Kittridge Street, Reseda, California (**Figure 1**). **Figure 2** shows the area of the high school subject to the CMP and the buildings/portable trailers that will be removed.

The Preliminary Endangerment Assessment-Equivalent (PEA-E) was conducted to assess environmental conditions at selected areas within the CMP footprint prior to the beginning of demolition, modernization and construction activities. LAUSD commissioned Ninyo & Moore to prepare a Phase 1 Environmental Site Assessment (ESA) for the Site (Ninyo & Moore, 2017a). Based on the findings of the ESA, LAUSD recommended that a PEA-E be performed at the Site.

The PEA-E was conducted in accordance with the Preliminary Environmental Assessment-Equivalent Work Plan (Work Plan) that was prepared by Ninyo & Moore on behalf of LAUSD (Ninyo & Moore, 2017b). It was also conducted in accordance with applicable regulatory guidance, including the *Preliminary Environmental Assessment Guidance Manual* (DTSC, 2015a) prepared by the California Department of Toxic Substances Control (DTSC). Field work was conducted in areas within the planned CMP footprint including Site buildings, a pad-mounted transformer, an existing (non-operational) incinerator, an existing (non-operational) clarifier, and historical paint booths. The field program included soil and soil vapor sampling and analyses. A human health screening evaluation (HHSE) was conducted for the Site based on the soil and soil vapor analytical data generated during the field investigation.

1.1 PEA-E OBJECTIVES

The objective of the PEA-E was to document subsurface environmental conditions at the Site and assess potential human health risks based on the analytical data generated during the field investigation. Specific objectives of the PEA-E are presented below.

- Investigate Areas of Concern (AOCs) identified in the Work Plan (Ninyo & Moore, 2017b) based on recognized environmental conditions (RECs) stated in the ESA (Ninyo & Moore, 2017b).
- Evaluate potential health risk to students and faculty in the subsurface that will be disturbed during the proposed construction activities.

- Evaluate the general extent of soil and soil vapor impacts in order to determine immediate potential health threats, and to scope future impacted media removal and remediation actions.

1.2 SCOPE OF WORK

The PEA-E scope of work consisted of the following:

- Preparation and distribution of an English and Spanish fieldwork notice. The fieldwork notice was distributed to line-of-sight neighbors, faculty, parents of Reseda High School students and posted on the school fence line.
- Notification of planned subsurface investigation to DigAlert. Locations were marked in the field using chalk-based paint and a geophysical survey was conducted prior to advancement of soil borings.
- Preparation of a Site-Specific Health and Safety Plan.
- Implementation of the Work Plan (Ninyo & Moore, 2017b) as follows:
  - Completion of 115 soil borings (AOC1-B1 through AOC1-B115) to a maximum depth of 2.5-feet (ft) below ground surface (bgs) to evaluate potential impacts in shallow soil from lead-based paint (LBP), arsenic, organochlorine pesticides (OCPs), and polychlorinated biphenyls (PCBs) near the Site buildings. Per the Work Plan, 10% of the samples were analyzed for PCBs and four to six samples were composited for OCP analysis. The 0.5-ft depth soil sample was analyzed and the step-down samples at 1.5-ft and 2.5-ft depths were placed on hold at the analytical laboratory. Multiple step-out sampling events were conducted based on exceedances encountered during the primary sample event.
  - Completion of two soil borings (AOC2-B1 and AOC2-B2) to a depth of 2.5-ft bgs to evaluate potential impacts in shallow soil from PCBs near a pad-mounted transformer. The 0.5-ft depth sample was analyzed and the step-down samples at 1.5-ft and 2.5-ft were placed on hold.
  - Completion of one soil boring (AOC3-B1) to a depth of 2.5-ft bgs to evaluate potential impacts in shallow soil from dioxins and furans near an existing (non-operational) incinerator. The 0.5-ft sample was analyzed and the step-down samples at 1.5-ft and 2.5-ft were placed on hold.
  - Completion of two soil borings (AOC4-B1 and AOC4-B2) to depth of 15-ft bgs to evaluate potential impacts in soil from total petroleum hydrocarbon (TPH), Title 22 Metals, PCBs, and volatile organic compounds (VOCs) near an existing (non-operational) clarifier. The 5-ft depth soil sample was analyzed, and the 10-ft and 15-ft samples were placed on hold.
  - Installation of two dual-nested soil vapor probes (AOC4-SV1 and AOC4-SV2) at depths of 5- and 15-ft bgs near the AOC4 boring locations to evaluate potential impacts in soil vapor from VOCs near the clarifier. The dual-nested soil vapor probes were purged and sampled by a certified mobile laboratory. Three subsequent step-out probe

installation and vapor sampling events were conducted based on the vapor data generated during the initial vapor sample event.

  - Installation of two dual-nested soil vapor probes (AOC5-SV1 and AOC5-SV2) at depths of 5- and 15-ft bgs to evaluate potential impacts in soil vapor from VOCs near suspected locations of historical spray paint booths. The dual nested soil vapor probes were purged and sampled by a mobile lab.

- Conducted a human health screening evaluation based on the analytical data generated during the field investigation.
- Preparation of the PEA-E Report.

2.0 SUMMARY OF SITE BACKGROUND

2.1 SITE DESCRIPTION

The Site is located at 18230 Kittridge Street, Reseda, CA 91335. The campus is bound to the south by Victory Boulevard and the Los Angeles River, Etiwanda Avenue to the west, Kittridge Street to the north, and Lindley Avenue to the east (**Figure 1**). The property is identified by the Los Angeles County Assessor's Office with Assessor's Identification Number (AIN) 2124-001-904. The approximate size of the school is 29.15 acres. The school was established in 1955.

The Site is developed with buildings associated with Reseda High School (**Figure 2**). There are currently sixteen permanent and portable classroom structures, athletic fields, and playground areas. The Site vicinity is primarily occupied by single-family residential structures to the north and east, bound by Reseda Park to the west and the Los Angeles River to the south.

2.2 SITE BACKGROUND

The results of the historical research for the Site conducted by Ninyo & Moore indicate that the Site consisted of agricultural land with some structures in the northeast corner from the 1920s to 1954/1955, when the Site was first developed with school buildings/improvements (Ninyo & Moore, 2017a). Based on aerial photographs additional structures were added to the Site as follows: 1) structures were added to the southwest portion of the Site between 1995 and 2002; 2) structures were added to the northeast portion of the Site between 2002 and 2005; and 3) structures were added to the southeast portion of the Site between 2005 and 2009. The Site address has been listed as Reseda High School since 1956. Grey Continuation High School is also listed as an occupant at the same address.

2.3 ADJACENT PROPERTY HISTORY

The adjacent properties were agricultural and/or undeveloped land since the 1920s. Reseda Park was established west of the Site in the 1940s. Residential structures first appear near the Site in the 1920s. Large residential communities were built to the north and east of the Site in the 1950s. Heavy residential development to the south of the Site, on the other side of the Los Angeles River, first appear in the 1960s. A summary of the off-site properties/facilities that Ninyo & Moore evaluated for potential impact to soil and/or groundwater at the Site can be found in the ESA (Ninyo & Moore, 2017a).

2.4 PHASE 1 ESA (2017)

A Phase 1 ESA was performed at the Site by Ninyo & Moore in 2017. Ninyo & Moore identified existing RECs, historical RECs and controlled RECs were identified at the Site. The ESA included a review of the physical setting and background information, a site reconnaissance to visually

observe Site conditions, a review of regulatory agency databases (federal, state, tribal and local), an Environmental Data Resources (EDR) standard environmental database search report, historical research (aerial photographs, topographic maps, Sanborn maps, building department records, etc.), a preliminary vapor encroachment screening to evaluate the potential for vapor encroachment conditions, and an interview with the property owner representative regarding the environmental status of the Site. No other significant assumptions were made during the presentation of the report (Ninyo & Moore, 2017a).

The ESA concluded the following:

- The former agricultural use with some structures in the northeast portion of the Site.
- One existing but inactive clarifier associated with the former automotive shop adjacent to the south of the Industrial Arts building (including a potential vapor encroachment condition).
- The former presence of spray paint booths on-site (including a potential vapor encroachment condition) based on the potential for releases from former leaks.
- Based on the former use of the incinerator to burn solid wastes, the likely presence of burnt material surrounding the incinerator.
- Based on the age of the current Site buildings, persistent termiticides (organochlorine pesticides or OCPs) and lead (from LBP) may be present in shallow soil around building foundations.
- PCB-containing materials may be present from the on-site pad mounted transformer installed prior to 1979.
- Arsenic in shallow soil underneath AC pavement may be present due to the LAUSD's former standard practice of applying herbicides containing this metal prior to paving.
- Based on the results of the vapor encroachment screening matrix (VESM) and information obtained during this Phase I ESA, a vapor encroachment condition (VEC) cannot be ruled out beneath the site.

The ESA recommended additional environmental assessment for the Site based on the findings, including; 1) assess PCBs, OCPs, arsenic, and lead in shallow soil at locations that future construction is planned; and 2) conduct soil and soil vapor investigations near the inactive clarifier, former spray booths, or incinerator if construction or demolition activates are planned in these areas.

2.5 PEA-E WORK PLAN (2017)

A PEA-E work plan was prepared by Ninyo and Moore in 2017 to evaluate the RECs that were reported in the ESA. The scope of work presented in the work plan consisted of collecting soil and soil vapor samples in areas of planned demolition, modernization, and construction activities associated with the CMP. The work plan was prepared to outline the field procedures and sampling and analysis program that would be used to conduct the PEA-E investigation at the Site. The PEA-E Work Plan was approved by LAUSD and is presented in **Appendix A**.

3.0 ENVIRONMENTAL SETTING

The information presented in this section is partially summarized from the ESA Report previously prepared for the Site (Ninyo & Moore, 2017a).

3.1 REGIONAL PHYSIOGRAPHIC SETTING

3.1.1 Topographic Setting

According to the 2012 United States Geological Survey (USGS) Los Angeles Quadrangle, the center of the school has an approximate latitude (North) of 34.188711 and longitude (West) of -118.529365. The school elevation is on average approximately 725 feet above mean sea level. The subject school property is essentially flat, with a slight surface gradient toward the east/southeast.

3.1.2 Nearest Surface Water Body

The nearest surface water body to the school is the Reseda Park Lake, located approximately 500 feet west of the western edge of the school property. A concrete-lined portion of the Los Angeles River channel is adjacent to the southern property line of the school. The Los Angeles River flows southeast toward the Pacific Ocean.

3.2 REGIONAL GEOLOGY

The 1992 Dibblee Geological Foundation Map "DF-36 Geologic Map of the Oat Mountain and Canoga Park (north ½) Quadrangle" shows the school property and surrounding vicinity to be underlain with alluvium (Qa) consisting of alluvial gravel, sand and clay of valley and floodplain areas.

3.2.1 Nearest Known Earthquake Faults

The nearest fault to the school site is the Northridge Fault, which is greater than six miles away.

3.2.2 Potential for Liquefaction and Landslides

According to the State of California Special Studies Zones Canoga Peak Quadrangle Map (Dated February 1, 1998) from the California Department of Conservation, the school property is within a liquification zone. These zones are classified as "areas where historical occurrence of liquefaction, or local geological, geotechnical and groundwater conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required." The school property does not fall within an identified earthquake-induced landslide zone.

According to the City of Los Angeles Planning Department's ZIMAS interactive mapping tool (http://zimas.lacity.org) accessed on February 23, 2018, the school property is within a potentially liquefiable zone. This is based on soil type and historical depth to groundwater, not site-specific

investigation. The school property is not within a potential landslide area per the City of Los Angeles ZIMAS database.

3.2.3 Potential for Flooding

The school property is not located within a designated 100-year or 500-year flood plain, according to the City of Los Angeles' Flood Hazard Map, dated August 9, 2016 (Prepared by Land Development & GIS Division, Bureau of Engineering, Dept. of Public Works).

3.2.4 Radon

The California Geologic Survey's Radon Potential Zone Map (prepared for the California Department of Health Services, Environmental Health Division, for Southern Los Angeles County dated January 2005) indicates the school property is within an area estimated to have low potential for indoor radon levels above 4.0 Picocuries per liter (P/L). Radon information for Los Angeles County indicates that the United States Environmental Protection Agency (USEPA) has categorized Los Angeles County as Zone 2 for radon. A Zone 2 classification is for areas with indoor average radon levels of greater than or equal to 2 P/L, but less than or equal to 4 P/L. The USEPA radon recommended action level is 4 P/L.

3.2.5 Methane

According to the City of Los Angeles Planning Department's ZIMAS interactive mapping tool (http://zimas.lacity.org) accessed on February 23, 2018, the school property is not identified as or within a Methane Hazard Site (LAPD, 2018).

3.2.6 Oil Fields and Wells

No known oil wells are located on-Site or adjacent to the school property per State of California Department of Conservation Division of Oil, Gas, and Geothermal Resources (DOGGR) Online Mapping System (https://maps.conservation.ca.gov/doggr/wellfinder/#close). A review of the DOGGR oil well tracking maps (accessed February 23, 2018) did not identify any oil wells or natural gas fields located on the school property. The closest oil well is located approximately more than one mile south/southeast of the school property. This nearest well is listed as plugged oil & gas well #1, API: 03705841; the well's former operator was San-Val Oil Co. Ltd. The next nearest well is greater than two miles to the northeast of the school property.

Additionally, according to the Oil Wells, Oil Fields and Landfill Sites Map produced by the City of Los Angeles, Bureau of Engineering (2007), the school property is not located within a boundary of a productive oil field.

3.3 REGIONAL HYDROGEOLOGY

3.3.1 Groundwater Flow Direction

State of California's Geotracker database (accessed on February 23, 2018) nearest monitoring wells are associated with a closed environmental case (Leon Automotive Center at 18102 Victory Boulevard, which is several hundred feet south of the school property, across Victory Boulevard to the south) which was granted closure by the Los Angeles Regional Water Quality Control Board

in 2016. The groundwater flow direction as determined in 2011 and 2012, by others during groundwater gauging, was toward the east. The nearest hydrogeologic data to the school property, provided in the EDR GeoCheck Report, is approximately ¾-mile northwest and across the Los Angeles River, and would not be considered representative of hydrogeologic conditions beneath the school property. The hydrogeologic information provided in the EDR GeoCheck report for properties listed in the vicinity (1/2- to 1 mile) of the school property suggest that groundwater flow direction may be southwest or northwest; no gradients are reported. Review of documents on the Geotracker website for nearby sites with groundwater flow direction and gradient information indicates that approximately 600 yards east of the school property, a formerly open leaking UST case "Vega Auto Service" at 1869 East 1st Street had a southeast groundwater flow direction at their property in 2008, and south/southwest from about 2009 through 2011 when case closure was granted by the RWQCB. The last gradient measured in November 2011 was 0.003 ft/ft.

3.3.2 Groundwater Wells Within a 1-Mile Radius of the School Property

The nearest groundwater well identified in the County of Los Angeles Department of Public Works production well location database (accessed February 23, 2018) is active well #3670, located near the intersection of Hartland Street and Hesperia Avenue, approximately 1,575 feet north/northeast of the school property. The most recent depth to water measurement was 66.70 feet below grade, on September 30, 2008. The next nearest well is active well #3681A, which had a reported depth to water measurement of 33 feet below grade, measured on May 27, 2015. This well is located more than 4,000 feet to the east of the school property, in the Sepulveda Flood Control District property.

State of California's Geotracker database (accessed on February 23, 2018) nearest monitoring wells are associated with a closed environmental case (Leon Automotive Center at 18102 Victory Boulevard, which is several hundred feet south of the school property, across Victory Boulevard to the south) which was granted closure by the Los Angeles Regional Water Quality Control Board in 2016. Depth to water was approximately 30 feet below ground surface prior to the well abandonment.

4.0 AREAS OF CONCERN (AOCS)

The PEA-E field investigation was conducted to evaluate RECs identified in the Phase 1 ESA and the following five AOCs identified in the Work Plan:

- **AOC1** – Evaluate potential impacts in shallow soil from lead-based paint, arsenic, OCPs, and PCBs around foundations of structures that will be removed as part of the planned CMP. Lead-based paint, OCPs and PCBs may be present in shallow soil based on the age of the current site buildings. Arsenic may be present in shallow soil due to LAUSD's former standard practice of applying herbicides for weed control containing metal prior to paving.
- **AOC2** – Evaluate potential impacts in shallow soil from PCBs near the on-site pad-mounted transformer that was installed prior to 1979.
- **AOC3** – Evaluate potential impacts in shallow soil from dioxins and furans near the existing (inactive) incinerator that was previously used to burn solid waste.
- **AOC4** – Evaluate potential impacts in soil from TPH, metals, PCBs and VOCs near the inactive clarifier associated with the former automotive shop adjacent to the Industrial Arts Building. Evaluate potential impacts in soil vapor from VOCs near the clarifier.
- **AOC5** – Evaluate potential impacts in soil vapor from VOCs near the suspected location of historical spray paint booths.

5.0 SAMPLING ACTIVITIES

The following sections describe the sampling strategy, methods and procedures, sample handling, decontamination procedures, and management of investigation-derived waste (IDW) for the field investigation. Soil sampling and soil vapor probe installation was conducted December 18– December 22, 2017, and on February 19th and 24th, March 26, and May 12, 2018. Soil vapor sampling was conducted on January 3, February 27, April 21, and May 22, 2018.

Site access and fieldwork notifications to school administrative personnel were coordinated with the LAUSD-OEHS Project Manager, the LAUSD Complex Project Manager, and the Reseda High School Plant Manager. The following subcontractors supported the fieldwork: Pacific Coast Locators (subsurface utility clearance), Rice General (concrete coring and hand augering), Gregg Drilling (direct push soil sampling and soil vapor probe installation), Jones Environmental (soil vapor sample collection/analysis), and Belshire Environmental Services, Inc. (IDW transport and disposal).

5.1 SAMPLING STRATEGY

The PEA field program consisted of soil and soil vapor sampling to investigate the RECs at the AOCs identified in Section 4. The sample locations proposed in the Work Plan, sample depths, analytical parameters, and sample location rationale are presented in **Table 1**. A description of the sample locations and analytical parameters completed at each AOC is provided below; sample locations are shown on **Figures 3 - 7**:

AOC1 – A total of 107 of the originally 115 proposed soil borings were initially completed around the exterior of the buildings within the footprints of future redevelopment activities. Eight of the originally proposed borings could not be completed as detailed in Section 7. Soil samples were collected from depths of 0.5-, 1.5-, and 2.5-ft bgs at each boring and either analyzed for lead and arsenic or archived by the laboratory. The step-down samples at 1.5-ft and 2.5-ft were analyzed if there was an exceedance of a screening level at 0.5-ft. The 1.5-foot and 2.5-foot sample was analyzed at twelve initial boring locations for arsenic and at four initial boring locations for lead. Additional step-down samples were collected and analyzed at 3.5-ft bgs due to an exceedance at 2.5-ft bgs at two of the initial boring locations.

Step-out soil sampling was conducted based on an exceedance of the screening criteria for lead and/or arsenic. In general, step-out soil samples were collected 5-ft and 10-ft in each direction from the initial soil sample exceedance unless there was a sample restriction (i.e., utility trench, fence line, building, or raised planter). The direction of the step-out soil sample was identified in the sample identification with a N for north, S for south, E for east and W for west. The step-out soil samples were only analyzed for the same compound as the initial sample exceedance compound.

A total of 80 step-out soil borings were advanced to delineate arsenic at the 12 initial locations in which there was an arsenic exceedance. A total of 22 step-out borings were advanced to delineate lead at the four initial location in which there was a lead exceedance. Samples were collected at each step-out boring at 0.5-, 1.5-, and 2.5-ft bgs and either analyzed for lead or arsenic or archived by the laboratory. Samples at the step-out boring locations were analyzed down to the depth of the initial sample depth with an exceedance. If there was an exceedance in a shallow sample (i.e., 0.5-ft bgs) at a step-out location the step-down samples at that step-out location were analyzed until no exceedances were detected.

A total of 10% of the initial soil samples collected at 0.5-ft bgs were analyzed for PCBs. Soil samples from 0.5-ft bgs were composited by the analytical laboratory and analyzed for OCPs. Each sample was a composite of soil from 0.5-ft bgs in four to six adjacent borings or borings surrounding a building.

AOC2 - Two soil borings were completed adjacent to the pad-mounted transformer. Soil samples were collected from depths of 0.5-, 1.5-, and 2.5-ft bgs at each boring and either analyzed for PCBs or archived by the laboratory.

AOC3 – One soil boring was collected near the inactive incinerator. Soil samples were collected from depths of 0.5-, 1.5-, and 2.5-feet bgs and either analyzed for dioxins and furans or archived by the laboratory.

AOC4 – Two borings were initially completed near the inactive clarifier. The borings were advanced to a total depth of 16-ft bgs. Soil samples were collected from depths of 5.0-, 10.0-, and 15.0- ft bgs at each boring and either analyzed for TPHs, Title 22 Metals, PCBs and VOCs or archived by the laboratory.

The two AOC4 soil borings were converted to soil vapor probe sampling locations. Soil vapor probes were installed at 5- and 15-ft bgs. A mobile laboratory sampled and analyzed soil vapor samples from the probes for VOCs.

Ten additional soil vapor probe locations were installed in step-out locations and sampled, based on the results of the initial sampling event, which had an exceedance of the DTSC's residential soil vapor screening criteria for tetrachloroethene (PCE) at location AOC4-SV1. Soil vapor probes were installed at 5- and 15-ft bgs at each location and soil vapor was sampled and analyzed by a mobile laboratory for VOCs. Soil samples were collected at seven of the ten additional vapor probe boring locations at 5- and 15-feet bgs and analyzed for TPH, PCBs and VOCs.

Three sub-slab soil vapor probes were installed within the western portion of the industrial arts building to evaluate VOCs immediately beneath the foundation slab.

AOC5 – Two soil vapor probe locations were completed near suspected (Ninyo & Moore, 2017a) locations of historical spray paint booths. Soil vapor probes were installed at 5- and 15-ft bgs. A mobile laboratory sampled and analyzed soil vapor samples from the vapor probes for VOCs.

5.2 PRELIMINARY SCREENING LEVELS

Analytical results for the soil and soil vapor samples were compared with risk-based screening levels to determine if the analytes are present at the Site at concentrations that may represent a potential health risk. The derivation of the screening levels used for the various chemical constituents is described in the following sub-sections. The screening levels are referred to here and after as PSLs (preliminary screening levels).

5.2.1 Screening Levels For Soil

For direct exposures to soils, the DTSC's (2015a) *Preliminary Endangerment Assessment Manual* states that risk-based screening levels used should be "the USEPA Regional Screening Level (RSL) for residential land use, modified as necessary by the DTSC in HHRA Note 3." Thus, the screening levels used here are, in general, the USEPA RSLs (2018) unless DTSC (2018) has published a screening value of its own, termed the DTSC-SLs. Chemicals with special considerations are discussed in more detail below.

Arsenic: The residential risk-based screening levels from USEPA (2018) and DTSC (2018) of 0.68 and 0.11 milligrams per kilogram (mg/kg) are well below background concentrations. Therefore, several toxicologists at DTSC (Chernoff et al. 2008) conducted a statistical evaluation of background data for arsenic in soils from Los Angeles, Orange, Riverside, San Bernardino, and San Diego Counties to derive an upper bound background threshold value for arsenic. Based on an evaluation of 1,086 data points, the authors derived a background threshold value for arsenic of 12 mg/kg, which is used here as the arsenic screening level.

Lead: Adverse health effects associated with exposure to lead have been correlated with concentrations of lead in whole blood. Although USEPA uses 10 micrograms per deciliter (µg/dl) as the threshold level of concern, California (OEHHA 2007) uses 1 µg/dl. A screening level of 80 mg/kg protective of a 90th percentile estimate of 1 µg/dl blood lead concentration in children was calculated by Cal EPA (OEHHA 2009), which is used by DTSC (2018). This standard represents the concentration of lead in soil that will result in a 90th percentile estimate of a 1 µg/dl increase in blood lead in the most sensitive receptor (i.e., child or fetus). DTSC (2018) states that individual samples may exceed 80 mg/kg, as long as the 95% UCL is below 80 mg/kg and hot spots are not present.

Dioxins/furans: Of the dioxin/furan congeners measured via USEPA Method 8290, toxicity data is only available for 2,3,7,8-tetrachlorodibenzodioxin (2,3,7,8-TCDD). However, the carcinogenicity of the other congeners relative to 2,3,7,8-TCDD is known. Therefore, the measured concentrations of dioxins/furan congeners in a sample are converted to a 2,3,7,8-TCDD

equivalent concentration using the toxicity equivalence factors in USEPA (2010) guidance and compared to the USEPA (2018) residential RSL, as modified by the DTSC (2018). In this conversion, nondetected congeners are represented by a zero.

OCPs: In general, the USEPA (2018) residential RSLs, as modified by the DTSC (2018) residential SLs, were used. However, as the soil samples analyzed for pesticides were composited from six individual samples, the screening levels were divided by six to ensure that no pesticides may have been present in any of the increments that were composited above the screening levels.

Petroleum hydrocarbons: Neither DTSC (2018) nor USEPA (2018) provide risk-based screening levels for petroleum hydrocarbons as measured by USEPA 8015. Instead, DTSC (2015) recommends that the risk-based screening levels derived by the San Francisco Regional Board (2016) for direct contact be used.

5.2.2 Screening Levels For Soil Vapor

Soil vapor screening levels were based on the USEPA (2018) residential RSLs for air, as modified by the DTSC (2018) residential SLs for air. However, these screening levels are for indoor and/or ambient air. To convert them to soil vapor and sub-slab soil vapor screening levels, the indoor air screening levels are divided by an attenuation factor. Both DTSC (2011) and USEPA (2015) recommended different attenuation factors. Further, Parsons has been unofficially informed by DTSC that the USEPA (2015) attenuation factors will be adopted by DTSC in its upcoming vapor intrusion guidance, which is scheduled to be released in August of 2018. However, as that guidance has not yet been released, both sets of attenuation factors are used to derive soil vapor screening levels. The screening levels derived are presented in **Table 11**.

5.3 PRE-FIELD ACTIVITIES

5.3.1 Notifications and Permitting

Prior to intrusive fieldwork, pre-field notifications were made. A work notice was prepared in English and Spanish and provided to all students and faculty members. The work notice was distributed to the line-of-sight residences of the school along Kittridge Street, Etiwanda Avenue, Victory Boulevard, and Lindley Avenue near where the work was being conducted. Work notices were also posted on all sides of the school perimeter fence within view from the public right-of-way. No permits were required to perform the work.

5.3.2 Utility Clearance

Soil boring locations were pre-marked with white paint and Underground Service Alert of Southern California (DigAlert) was notified of the proposed boring locations prior to initiating boring activities. DigAlert contacted all utility owners of record within the Site vicinity and notified them of the planned subsurface investigation. All utility owners of record, or their designated agents, clearly marked the position of their utilities on the ground surface on the public right-of-way sidewalks and street adjacent to the area designated for investigation, up to the school

property line. LAUSD provided several available as-built plans depicting locations of subsurface structures and utilities which were also reviewed prior to marking the boring locations.

The proposed sampling area was surveyed by Pacific Coast Locators, a private utility locator, for the presence of underground utilities using geophysical methods (including ground-penetrating radar, electromagnetic utility locating, and deep search metal detector). Based on the presence of subsurface utilities identified in several locations, each affected boring location was relocated slightly or cancelled, to avoid causing damage to the utility.

5.4 SAMPLING PROCEDURES

5.4.1 Soil Sample Collection

Soil samples were collected on December 18 – 22, 2017, and February 19th and 24th, March 26, and May 12, 2018. Boring locations in asphalt or concrete were cored prior to soil sample collection. Shallow soil samples were collected using a hand auger. Each soil sample was collected in a manner that minimized disturbance and allowed the sample to retain as much of the original structure as possible. Soil samples were collected directly from the hand auger at each depth interval and placed in a laboratory-provided 8-ounce (oz) glass jar.

A Marl 2.5T direct push rig operated by Gregg Drilling and Testing, Inc. was used to collect soil samples at three of the fifteen soil vapor probe locations. The soil samples were collected in 4-ft long acetate sleeves placed inside the direct push rods. Upon removal from the subsurface, the soil-filled acetate tube was opened length-wise and each sample was collected from the desired depth and placed in an 8 oz jar for laboratory analysis. VOC samples were collected by driving a TerraCore sampler into the soil and placing each sample in the proper laboratory provided sample container. Soil vapor probe locations AOC4-SV2 and AOC4-SV9 through AOC4-SV13 were hand augured to total depth due to site conditions (see Section 7 for details). At locations that were hand augured, soil samples were collected at the desired depths directly from the hand auger.

Soil samples were collected in new laboratory-provided glass jars, which were then placed in individual sealable plastic bags. Each sample jar was labeled individually, stored in an ice chest containing ice, and delivered to a certified laboratory with a chain-of-custody form. Borings were backfilled with clean sand and the surface material placed to match the existing surface.

5.4.2 Soil Vapor Sample Collection

Soil Vapor Probe Construction

Soil vapor probes AOC4-SV1 through AOC4-SV13, AOC5-SV1 and AOC5-SV2 were installed as dual-nested probes. The direct push rig was used to install the dual-nested probes at AOC4-SV1, AOC4-SV3 through AOC4-SV6, AOC4-SV8 and AOC5-SV1. A hand auger was used to install the dual-nested probes at AOC4-SV2, AOC4-SV9 through AOC4-SV13 and AOC5-SV2. A 6-inch long stainless-steel inlet screen was connected to ¼-inch outer diameter Teflon tubing, which extended from ground surface to approximately 14.5- to 15-ft bgs and 4.5- to 5-ft bgs. The

screens were centered within approximately 1 foot of #2/16 sand so that approximately 3 inches of sand extended above and below the screen. The borings were backfilled from total depth to 15-ft bgs with granular bentonite. One foot of dry granular bentonite was placed immediately above each sand interval and then overlain with hydrated granular bentonite. Granular bentonite extended from 14.25- to 5.25-ft bgs, and from 4.25-ft bgs to 1-foot bgs. The vapor monitoring probe tips were placed in a plastic bag and the top of the tubing was coiled within the concrete/asphalt core. The core was capped with temporary asphalt patch. A copy of the boring log is located in **Appendix A**.

Sub-Slab Probe Construction

Sub-slab soil vapor sampling was conducted by installing a VAPOR PIN® at three locations inside the industrial arts building (AOC4-SS1, AOC4-SS2, AOC4-SS3). A hammer drill was used to drill a 1 ½-inch diameter hole into the concrete a minimum of 1 ¾-inches into the slab. A 5/8-inch diameter hole was drilled through the slab and approximately 1-inch into the underlying soil to form a void. The lower end of the VAPOR PIN® assembly was placed in the hole and the pin was tapped into place using a dead hammer. The VAPOR PIN® was protected using the flush mount cover.

Soil Vapor Sampling

The vapor monitoring probes and sub-slab probes were allowed to equilibrate at least 48 hours prior to purging and sampling. The probes were sampled in accordance with *Department of Toxic Substances Control (DTSC) 2015 Advisory – Active Soil Gas Investigations* (DTSC, 2015). Purge volumes were calculated at each vapor probe using the volume of the soil vapor probe, filter pack, dry bentonite, and the tubing in the purge/sampling train to the purge pump.

Prior to purging and sampling at each soil vapor probe or sub-slab probe, a shut-in test was conducted to check for leaks in the above ground fittings. The shut-in test was performed on the above ground apparatus by evacuating the line to a vacuum of approximately 100 inches of water, sealing the entire system and observing the vacuum for a minimum of 1 minute. A vacuum gauge, connected in parallel to the apparatus, was used to measure the vacuum. The above-ground fittings were adjusted until there was no noticeable change in the vacuum.

The purge and sampling flow rate was approximately 200 cubic centimeters per minute (cc/min), as noted on the laboratory provided analytical reports and chain of custody (CoC) forms. A default of 3 purge volumes was used as recommended by July 2015 DTSC/RWQCB guidance documents. Purging was completed using a pump except if noted on the CoC. Soil vapor samples were collected in glass gas-tight syringes equipped with Teflon plungers.

A tracer gas of n-pentane, n-hexane, and n-heptane was used as leak-test compounds to determine if there were surface leaks into the subsurface due to lack of annular space probe seals. The tracer

gas was placed at the tubing-surface interface before sampling. The tracer gas was included as a target analyte during the VOC analysis.

Soil vapor samples were analyzed for VOCs by a mobile laboratory using EPA Method 8260. The quality assurance quality control (QA/QC) documents are provided with the soil vapor laboratory reports.

5.5 EQUIPMENT DECONTAMINATION

Down-hole equipment used during soil sampling activities was decontaminated prior to use at each sampling point to reduce the potential for cross-contamination. Reusable sampling equipment was decontaminated between each sampling event using the following procedures:

- Wash with Liquinox and brush to remove excess contaminants;
- Rinse with distilled water; and
- Rinse twice with distilled water.

5.6 INVESTIGATIVE DERIVED WASTE

Used personal protective equipment and disposable equipment was double-bagged and placed in the on-site dumpster. These wastes are not considered hazardous and were sent to a municipal landfill.

Nine (9) 55-gallon drums of soil cuttings were generated during the field activities. The soil was temporarily stored on-site in properly labeled Department of Transportation-approved drums pending disposal profiling. Seven drums were removed by Belshire Environmental Services, Inc. (BESI) on March 16, 2018, and two drums were removed by BESI on June 22, 2018. The drums were disposed of at Soil Safe in Adelanto, California. Drum disposal documentation is provided in **Appendix B**.

6.0 RESULTS

6.1 INTRODUCTION

This section discusses the results of the soil and soil vapor sampling. Soil samples were analyzed by TestAmerica Laboratories, Inc., an Environmental Laboratory Accreditation Program (ELAP)-certified laboratory located in Irvine, California. The data were reviewed and are considered acceptable for decision-making purposes. Copies of the soil analytical laboratory reports are provided in **Appendix C**. Soil vapor samples were collected and analyzed by Jones Environmental mobile laboratory. Copies of the soil vapor analytical laboratory reports are provided in **Appendix D**.

6.2 SOIL SAMPLING RESULTS

Soil analytical results for the field investigation are summarized in the following sections. The results are discussed for each compound that was analyzed in soil at the five AOCs. The analytical data are compiled in **Tables 3 – 9** and the initial soil sample locations are presented on **Figures 3 – 7**. The step-out soil sample locations are identified in **Table 11** and presented in **Figures 8 - 18**.

The samples were analyzed by Test America by the following methods:

- Lead and arsenic by US EPA Method 6010B
- PCBs by US EPA Method 8082
- OCPs by US EPA Method 8081A
- Dioxins and Furans by US EPA Method 8290
- TPH by US EPA Method 8015M
- VOCs by US EPA Method 8260B
- Title 22 Metals by US EPA Method 6010B and 7471A

6.2.1 Arsenic

At AOC1, shallow soil samples (0.5-ft bgs) at the 107 initial boring locations in AOC1 (AOC1-B1 through AOC1-B115) were analyzed for arsenic. Eleven duplicate samples were collected from the set of initial samples at 0.5-ft bgs. The analytical results for arsenic are presented on **Table 2** with a comparison to the arsenic PSL of 12 mg/kg. Detected arsenic concentrations ranged from 2.7J mg/kg (AOC1-B80) to 32 mg/kg (AOC1-B10). The arsenic concentrations at 12 initial locations in the shallow soil samples (i.e., 0.5-ft bgs) (AOC1-B1, AOC1-B8, AOC1-B10, AOC1-B22, AOC1-B58, AOC1-B64, AOC1-B77, AOC1-B78, AOC1-B81, AOC1-B91, AOC1-B108, AOC1-B112) exceeded the PSL.

To bound the vertical extent of arsenic at each initial boring location where there was an exceedance at 0.5-ft bgs, the step-down sample at 1.5-ft bgs and 2.5-ft bgs was also analyzed. Arsenic concentrations ranged from 5.3 mg/kg (AOC4-B8-2.5) to 37 mg/kg (AOC4-B77-D1.5) in the step-down samples analyzed at the initial boring locations. Soil samples were collected and analyzed at 3.5-ft bgs at AOC4-B77 and AOC4-B81 due to an arsenic exceedance at 2.5-ft bgs. The arsenic concentration in the two samples analyzed at the 3.5-ft depth were below the PSL for arsenic.

A total of 80 step-out samples and24 duplicate samples were collected at 0.5-ft bgs to delineate arsenic at the 12 initial locations with an arsenic exceedance. Detected arsenic concentrations ranged from 1.9 mg/kg (Duplicate at AOC1-B91-E10) to 33 mg/kg (AOC1-B81-NE20) in the step-out samples at 0.5-ft bgs. A total of 35 step-out samples exceeded the PSL for arsenic. Ninety-two step-downs and three duplicate samples were analyzed at the step-out sample locations. Detected arsenic concentrations ranged from 3.2 mg/kg (AOC1-B91-N20 at 2.5-ft bgs) to 31 mg/kg (AOC1-B77-SW5 at 1.5-ft bgs) in the step-down samples. The maximum depth that soil samples were collected and analyzed for arsenic was 3.5-ft bgs. **Table 11** presents the step-out samples collected in each direction from the initial sample, distance from the initial sample location, maximum depth of a step-out sample exceedance in each direction from the initial sample location, and the step-out restrictions (if any) at each location. **Figures 8 - 18** show the step-out sampling locations for arsenic.

6.2.2 Lead

At AOC1, shallow soil samples (0.5-ft bgs) at the 107 initial boring locations identified in AOC1 (AOC1-B1 through AOC1-B115) were analyzed for lead. Eleven duplicate samples were collected from the set of initial borings at 0.5-ft bgs. The analytical results for lead are presented on **Table 2** with a comparison to the lead PSL of 80 mg/kg. Lead concentrations in the 107 initial shallow soil samples ranged from 3.7 mg/kg (AOC1-B80) to 170 mg/kg (AOC1-B6). The lead concentrations at four of the initial shallow soil sample locations (AOC1-B6, AOC1-B34, AOC1-B100, AOC1-B108) exceeded the PSL for lead.

To bound the vertical extent of lead at each boring location in which there was an exceedance at 0.5-ft bgs, the step-down samples at 1.5-ft and 2.5-ft bgs sample were also analyzed. Lead concentrations ranged from 6.2 mg/kg (AOC4-B6-2.5) to 29 mg/kg (AOC4-B34-D2.5) in the step-down samples analyzed at the initial boring locations.

A total of 24 step-out samples and three duplicate samples were collected at 0.5-ft bgs to delineate lead at the 4 initial locations with a lead exceedance. Detected lead concentrations ranged from 5.3 mg/kg (AOC1-B6-W10) to 120 mg/kg (AOC1-B23-N5) in the step-out samples. The lead concentration at AOC1-B23-N5 exceeded the PSL for lead. Two step-down samples were analyzed at the step-out locations. Both step-down samples analyzed at AOC1-B23-N5 were below the PSL for lead.

Lead concentrations at four initial shallow sample locations and one step-out sample location exceeded 80 mg/kg. These four samples were analyzed for soluble lead for waste characterization purposes. The four samples were analyzed for soluble lead by the California Soluble Threshold Limit Concentration (STLC) test method and one sample (AOC1-B34) was analyzed by the USEPA Toxicity Characteristic Leaching Procedure (TCLP) test method.

The STLC results did not exceed the 5 mg/L threshold used by the State of California to define a waste as non-Resource Conservation and Recovery Act (RCRA) hazardous at sample locations AOC1-B6-D0.5, AOC1-B34-N5-D0.5, AOC1-B100-D0.5, and AOC1-B108-D0.5. The STLC result of 6.1 mg/L at sample location AOC1-B34-D0.5 exceeded the 5 mg/L threshold, but the TCLP result of 0.15 mg/L did not exceed the 5 mg/L threshold that would require soil to be managed as a RCRA hazardous waste. Results of the STLC and TCLP analysis are presented in **Table 2** and copies of the analytical laboratory reports are provided in **Appendix C**.

6.2.3 PCBs

Fifteen non-biased discrete shallow soil samples (0.5-ft bgs) representing 10% of the initial AOC1 sample locations, two 0.5-ft bgs soil samples from AOC2, six 5-ft bgs soil samples at AOC4, and four 15-ft bgs soil samples at AOC4 were collected and analyzed for PCBs. PCBs were not detected above their respective laboratory reporting limits in any of the samples analyzed. Three samples (AOC1-B21, AOC1B-33, AOC1-B54) and a duplicate sample (AOC1-B21) had laboratory J-qualifiers between the laboratory reporting limit and minimum detection limit for PCB-1260. As presented on **Table 3**, none of the PCB sample compounds exceeded their respective PSLs. Based on these results, PCBs are not considered a Site chemical of concern (COC).

6.2.4 OCPs

At AOC1, composite samples from four to six adjacent borings, or borings surrounding a building, all from the same depth, were prepared by the laboratory, and analyzed for OCPs. A total of 26 composite samples were prepared by the laboratory. The laboratory results indicate the only OCP detections above the laboratory reporting limit in the soil samples collected at AOC1 were for 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, chlordane (technical), and dieldrin, which are under the PSLs of 317, 333, 317, 73 and 5.7 µg/kg, respectively, for composites of a maximum of six discrete samples (DTSC, 2006). The OCP results are presented in **Table 4**. Based on these results, OCPs are not considered a Site COC.

6.2.5 Dioxins and Furans

One shallow soil sample and a corresponding duplicate soil sample from AOC3 were analyzed for dioxins and furans. The measured concentrations of dioxins/furans in the samples were converted to a 2,3,7,8-TCDD equivalent concentration using the toxicity equivalence factors in USEPA (2010) guidance. The results for AOC3-B1-D0.5 (1.2 picograms per gram [pg/g]) and AOC3-B1-D0.5-DUP (1.0 pg/g) did not exceed the USEPA residential PSL of 4.8 picograms per gram (pg/g)

and the DTSC residential RG of 5 pg/g. The dioxin and furan results are presented in **Table 5**. Based on these results, dioxins and furans are not considered a Site COC.

6.2.6 TPH

At AOC4, sixteen soil samples and three duplicate samples were analyzed for TPH in the gasoline range (TPH-g), diesel range (TPH-d), and oil range (TPH-o). TPH-o was detected above the laboratory reporting limit in eleven soil samples ranging in concentration from 2.4J mg/kg (AOC4-SV13-5) to 21B mg/kg (AOC4-SV8-5). Detections of TPH-o were below the San Francisco RWQCB RSL of 10,746 mg/kg San Francisco Regional Board (2016). The analytical results are provided in **Table 5**. Based on these results, TPH is not considered a Site COC.

6.2.7 VOCs in Soil

At AOC4, sixteen soil samples and three duplicate samples were analyzed for VOCs. Seven VOC compounds were detected in soil with maximum concentrations as follows: benzene (3.2 µg/kg); 2-Butanone (6.1J µg/kg); ethylbenzene (2.0 µg/kg); naphthalene (1.7J µg/kg); PCE (1.2J µg/kg); toluene (3.9 µg/kg); 1,2,3-trichlorobenzene (0.97J µg/kg). The concentrations of detected VOCs were below PSLs. The analytical results are provided in **Table 7**. All other VOCs were not detected above their respective laboratory reporting limits.

6.2.8 Title 22 Metals

At AOC4, two primary soil samples and one duplicate sample were analyzed for Title 22 metals. Antimony, selenium, silver, and thallium were not detected above their respective laboratory reporting limits in the samples. Maximum detected concentrations of the remaining metals were as follows: arsenic (9 mg/kg), barium (200 mg/kg), beryllium (1.2 mg/kg), cadmium (3.0 mg/kg), chromium (43 mg/kg), cobalt (9.9 mg/kg), copper (37 mg/kg), lead (7.1 mg/kg), mercury (0.028 mg/kg), nickel (45 mg/kg), vanadium (88 mg/kg), and zinc (94 mg/kg). The detections of Title 22 metals were below PSLs at AOC4. The analytical results are provided in **Table 8**.

6.3 SOIL VAPOR SAMPLING RESULTS

6.3.1 VOCs in Soil Vapor at AOC4

A total of four initial soil vapor samples and one duplicate sample were collected from AOC4 and analyzed by a mobile laboratory for VOCs on January 3, 2018. PCE was detected above the current PSL at AOC4-SV1-5 and AOC4-SV1-15. PCE ranged from 196 micrograms per cubic meter (µg/m^3) (AOC4-SV2-5) to 322 µg/m^3 (AOC4-SV1-15). No other VOCs were detected above their respective PSLs. The analytical results are provided in **Table 9** and the soil vapor probe locations are presented on **Figure 3**.

Dual-nested soil vapor probes were installed at three additional locations (AOC4-SV3 through AOC4-SV5) to delineate PCE in soil vapor. Ten soil vapor samples and one duplicate sample were collected from AOC4-SV1 through AOC4-SV5 on February 27, 2018 and analyzed for VOCs by a mobile lab. PCE concentrations ranged from non-detect (ND) at (AOC4-SV5-5) to

448 µg/m^3 (AOC4-SV3-15). PCE exceeded the current PSL at AOC4-SV1-15, AOC4-SV3-5 and AOC4-SV3-15. No other VOCs were detected above their PSLs.

Dual-nested soil vapor probes were installed at four additional locations (AOC4-SV6, AOC4-SV8 through AOC4-SV10) to further delineate PCE in soil vapor. Twelve soil vapor samples and two duplicates were collected from AOC4-SV1, AOC4-SV3, AOC4-SV6, and AOC4-SV8 through AOC4-SV10 on April 21, 2018 and analyzed for VOCs by a mobile lab. PCE concentrations ranged from 93 µg/m^3 (AOC4-SV6-5) to 489 µg/m^3 (AOC4-SV3-15). PCE exceeded the current PSL at AOC4-SV1-5, AOC4-SV1-15, AOC4-SV3-5, AOC4-SV3-15, AOC4-SV8-5, AOC4-SV8-15, AOC4-SV10-5 and AOC4-S10-15. No other VOCs were detected above their PSLs.

Dual-nested soil vapor probes were installed at three additional locations (AOC4-SV-11 through AOC4-SV-13). Three sub-slab soil vapor probes (AOC4-SS1 through AOC4-SS3) were installed within the industrial arts building to evaluate PCE in the slab of the foundation. Nine soil vapor samples and one duplicate sample were collected from AOC4-SV11 through AOC4-SV13 and AOC4-SS1 through AOC4-SS3 and analyzed for VOCs by a mobile lab on May 22, 2018. PCE concentrations in the soil vapor probes ranged from 17 µg/m^3 (AOC4-SV13-5) to 296 µg /m^3 (AOC4-SV11-5). PCE concentrations in the sub-slab samples ranged from 144 µg /m^3 (AOC4-SS1) to 523 µg /m^3 (AOC4-SS3). PCE exceeded the current RSLs at AOC4-SV11-5, AOC4-SV11-15, AOC4-SS1, AOC4-SS2 and AOC4-SS3. Benzene exceeded the current RSL at AOC4-SV12-5, AOC4-SS1, AOC4-SS2 and AOC4-SS3. The step-out soil vapor probe and sub-slab sample locations are presented on **Figure 19**.

6.3.2 VOCs in Soil Vapor at AOC5

A total of four initial soil vapor samples were collected from AOC5 and analyzed by the mobile laboratory for VOCs by USEPA Method 8260B on January 3, 2018. Toluene was the only VOC detected above the laboratory detection limits at AOC5. Toluene was detected in soil vapor at AOC5-SV1-15, AOC4-SV2-5 and ACO4-SV2-15 ranging from 9 µg/m3 to 15 µg/m3. The toluene concentrations detected in soil vapor are below the current PSLs. The analytical results are provided in **Table 9** and the soil vapor probe locations are depicted on **Figure 4**. VOCs in soil vapor are not considered a COC at AOC5.

6.4 DELINEATION OF IMPACTS IN SOIL

Arsenic concentrations at 11 locations (AOC1-B1, AOC1-B8, AOC1-B10, AOC1-B22, AOC1-B58, AOC1-B64, AOC1-B77, AOC1-B78, AOC1-B81, AOC1-B91, and AOC1-B112) in shallow soil (0.5-ft bgs) exceeded the PSL of 12 mg/kg. Lead concentrations in soil at three locations (AOC1-B6, AOC1-B34, and AOC1-B100) exceeded the PSL of 80 mg/kg. At location AOC1-B108 both arsenic and lead exceeded their respective PSLs in soil. The areas of impacted soil are shown on **Figures 8 – 18**. Step-out sampling conducted at the locations in which soil samples exceeded RSLs delineated the lateral extent of impacted soil at the Site. At the direction of the LAUSD Project Manager, the boundary of lateral impacts in soil were determined by establishing

a clean (i.e., non-detect) step-out sample location or a sample restriction (i.e.: building, utility, fence, etc.). **Table 11** identifies step-out distances and restrictions.

The vertical extent of soil exceedances was defined by conducting step-down sampling. Vertical impacts of lead and/or arsenic do not extend below 1.5-ft bgs at the following locations: AOC1-B1, AOC1-B6, AOC1-B8, AOC1-B10, AOC1-B34, AOC1-B58, AOC1-B64, AOC1-B100, AOC1-B108, and AOC1-B112. Vertical impacts do not extend below 2.5-ft bgs at AOC1-B22 and AOC1-B78. Vertical impacts do not extend below 3.5-ft bgs at AOC1-B77, AOC1-B81 and AOC1-B91.

The depths and dimensions of impacted soil at each location are shown on **Figures 8 - 18**. The estimated volumes of impacted soil are summarized in **Table 11**. An estimated 266 cubic yards of soil are impacted by lead and/or arsenic based on the results of the field investigation. Approximately 261 cubic yards can be managed as non-hazardous waste and approximately 5 cubic yards can be managed as non-RCRA hazardous waste.

6.5 DELINEATION OF IMPACTS IN SOIL VAPOR

The PCE soil vapor concentration exceeded the current PSLs at AOC4-SV1, AOC4-SV3, AOC4-SV8, AOC4-SV10 and AOC4-SV11. Soil vapor exceeded the current PSL for benzene at AOC4-SV12 at 15-ft bgs. The elevated PCE soil-vapor impact has been delineated to the west by AOC4-SV6 and AOC4-SV9; to the east by AOC4-SV5; to the south by AOC4-SV12, and; to the north by AOC4-SV13.

7.0 FIELD VARIANCES

Field conditions caused the following variances from the original scope of work:

- Boring locations around existing buildings were adjusted to account for access ramps and other obstructions (e.g., stored equipment, fencing, trees and bushes, etc.). Further adjustments to some boring locations were made to provide an adequate distance from subsurface utility lines identified by the geophysical survey. Final boring locations are presented on **Figures 3 - 19**.

- Borings were not completed at AOC1-B49, AOC1-B53 or AOC1-B56 due to the presence of extensive subsurface utilities.

- Borings were not completed at AOC1-B32, AOC1-B35, AOC1-B42 or AOC1-B50 due to the presence of wooden fencing between buildings preventing access.

- Boring location AOC1-B7 was not sampled because there was a void space immediately below the concrete.

- Access issues at AOC4-SV2, AOC4-SV9 through AOC4-SV13 and AOC5-SV2 provided insufficient clearance to use the Marl 2.5T direct-push drill rig. These locations were hand-augured to total depth.

- Step-out borings north and south of primary boring locations AOC1-B58 and AOC1-B64 were adjusted 3 feet to the east and west, respectively, to account for wheel chair ramps.

- Step-out location AOC1-B58/B64 was located equi-distant from primary boring location AOC1-B58 and AOC1-B64. This location served as the 10-foot step-out sample for each primary location.

8.0 HUMAN HEALTH SCREENING EVALUATION

This section presents the human health screening evaluation (HHSE) portion of the PEA. The HHSE evaluates potential impacts to human health from exposure to the chemicals detected in soil and soil vapor at the Site. Following the PEA Guidance Manual (DTSC, 2015a), the HHSE is performed within the context of a health risk assessment that addresses an unrestricted future residential land-use scenario, which is more health-protective than the existing and continued use of the Site as a school.

8.1 SOILS

For soils, arsenic and lead are the only chemicals that were detected above PSLs in soils at the Site (**see Table 2**). Arsenic was detected at a maximum concentration of 37 mg/kg, while lead was detected at a maximum concentration of 170 mg/kg. These exceed the PSLs of 12 mg/kg and 80 mg/kg, respectively.

Any concentrations above PSLs may pose an unacceptable health risk for a residential land use scenario. To further evaluate the potential risks from exposures to arsenic and lead, site-wide 95% upper confidence limits on the mean (UCLs) were calculated using USEPA's (2015) ProUCL v5.1.002 for several depth intervals. The UCLs recommended by ProUCL are shown in **Table 9.1** below. The ProUCL output is provided in **Appendix E**.

Table 8.1. UCLs for arsenic and lead in soil by depth interval.

Depth interval (ft bgs)	Arsenic (mg/kg)	Lead (mg/kg)
0-0.5	12.22	30.52
0-1.5	10.83	29.97
0-2.5	10.41	29.55
0-3.5	10.37	*

Notes: no soil samples from >2.5-3.5 ft bgs were analyzed for lead.

For arsenic, the results above indicate that, on a site-wide average, arsenic does not exceed the upper bound background value of 12 mg/kg below the surface and only slightly exceeds it in surface (0-0.5-ft bgs). Nonetheless, arsenic was detected at concentrations greater than background in 12 initial locations. Multiple step-out and step-down samples were collected at each initial location. At three of the initial locations (i.e., AOC1-B58, AOC1-B64, and AOC1-B108), arsenic was not detected above background in any of the step-out and step-down samples

and the maximum detected concentration was only slightly above background (i.e., 13, 13, and 17 mg/kg for the three previously listed borings, respectively), indicating that the area of elevated arsenic is relatively small and may not warrant remediation. However, at the other initial locations, at least one step-out/step-down sample also exceeded background, indicating that remediation may be warranted.

For lead, DTSC (2018) guidance states that individual samples may exceed the screening level of 80 mg/kg as long as the UCL is less than the screening level and there are no hotspots. Given that only 5 samples (of 153) had lead concentrations greater than 80 mg/kg and those exceedances were not co-located, it does not appear that there are any "hot spots" and further action does not appear to be warranted.

8.2 SOIL VAPOR

In both the soil vapor and sub-slab soil vapor samples collected at the site, only benzene and PCE were detected at concentrations above both the current and (likely) future screening levels (see **Tables 9 and 10**).

Benzene. Outside of the buildings at the site, there was a detection of benzene above the PSLs at 15-ft bgs at sample location AOC4-SV12, but benzene was not detected in the 5-ft bgs sample at the same location. This likely indicates that benzene is degrading as it migrates through the soil column and that benzene in soil vapor at AOC4-SV12 does not represent a potential risk. However, benzene was also detected above the PSLs in two sub-slab soil vapor samples at up to 23 times the current PSL. It should be noted that using the default DTSC (2011) and USEPA (2015) sub-slab soil vapor attenuation factors, the maximum detected sub-slab soil vapor benzene concentration of 209 micrograms per cubic meter ($\mu g/m^3$) corresponds to indoor air concentrations of 10.45 and 6.27 $\mu g/m^3$, respectively. This is not substantially greater than the ambient concentrations at the two nearest Air Resources Board monitoring stations; i.e., Simi Valley (0.16 to 1.41 $\mu g/m^3$ for 2016-2017) and Burbank (0.50 to 4.79 $\mu g/m^3$ for 2013). Lastly, it should be noted that the screening levels used here are for residents and not school-based receptors and are likely to be over protective of exposures and risks at the site. Overall, benzene in sub-slab soil vapor at the Site does exceed screening levels but is only likely to represent a slight risk above background exposures.

Tetrachloroethene (PCE). In the sub-slab soil vapor samples, PCE was detected at up to 523 $\mu g/m^3$, which is 57 times the current (and more conservative) PSL. In the soil vapor probes installed outside of the buildings, PCE was detected at up to 489 $\mu g/m^3$, which is 2 times the current PSL but 33 times the (likely) future RSL. Using the default DTSC (2011) and USEPA (2015) sub-slab soil vapor attenuation factors, the maximum detected sub-slab soil vapor concentration of 523 $\mu g/m^3$ corresponds to indoor air concentrations of 26.15 and 15.69 $\mu g/m^3$, respectively. These concentrations are substantially greater than the ambient concentrations at the two nearest Air Resources Board monitoring stations; i.e., Simi Valley (0.034 to 0.54 $\mu g/m^3$ for

2016-2017) and Burbank (0.14 to 1.15 µg/m^3 for 2013). While the PSLs used here are likely to be over protective of school-based receptors (as explained above), the detections of PCE exceed the PSLs by a large margin and the estimated concentrations in indoor air are well above background. Thus, PCE in soil vapor is likely to represent a potential risk at the Site.

9.0 CONCLUSIONS AND RECOMMENDATIONS

9.1 CONCLUSIONS

The following conclusions were derived from the soil and soil vapor sampling and analyses conducted at the Reseda High School:

- PCBs were not detected above their respective laboratory reporting limits in any of the soil or soil vapor samples analyzed. Therefore, PCBs are not considered a Site COC.
- Five OCPs (4,4'-DDD, 4,4'-DDE, 4,4'-DDT, chlordane, and dieldrin) were detected above their respective reporting limits in one or more composite soil samples. OCP concentrations were all below PSLs; therefore, OCPs are not considered Site COCs.
- The concentrations of dioxins/furans in the soil samples did not exceed PSLs. Therefore, dioxins and furans are not considered Site CoCs.
- TPH-g and TPH-d were not detected in the soil samples collected at the Site. TPH-o was detected above the laboratory reporting limit in eleven soil samples but was below the PSLs. Therefore, TPHs are not considered Site COCs.
- Title 22 metals were below PSLs except for arsenic and lead.
- Lead results from soil samples collected in the proposed development areas are below the PSL (80 mg/kg) in 103 of the 107 initial boring locations. The highest exceedance of lead was 170 mg/kg at location AOC1-B6 at 0.5-ft bgs. Step-down and lateral step-out sampling was conducted until the detected lead concentrations were less than the screening level of 80 mg/kg, a building foundation was reached, access was limited, or a subsurface utility was encountered.
- Arsenic results from soil samples collected in the proposed development area are below the PSL (12 mg/kg) in 95 of the 107 initial boring locations. The highest exceedance of arsenic at the initial sample locations was 32 mg/kg at AOC1-B10 at 0.5-ft bgs. Step-down and lateral step-out sampling was conducted until the detected arsenic concentrations were less than the PSL of 12 mg/kg, a building foundation was reached, access was limited, or a subsurface utility was encountered.
- An estimated 266 cubic yards of soil are impacted by lead and/or arsenic based on the results of the field investigation. Approximately 261 cubic yards can be managed as non-hazardous waste and approximately 5 cubic yards can be managed as non-RCRA hazardous waste.
- PCE was detected above the current PSLs in soil vapor at 5- and 15-ft bgs at probe locations AOC4-SV1, AOC4-SV3, AOC4-SV4, AOC4-SV8, AOC4-SV10 and AOC4-SV11. PCE was detected above the current PSL in soil vapor at sub-slab locations AOC4-SS1, AOC4-SS2 and AOC4-SS3. The elevated PCE soil-vapor impact has been delineated to the west by AOC4-SV6 and AOC4-SV9; to the east by AOC4-SV5; to the south by AOC4-SV12,

and; to the north by AOC4-SV13. PCE in soil vapor is likely to represent a potential risk at the Site.

- Benzene was detected above the current PSL in soil vapor at 15-ft bgs at AOC4-SV12, but benzene was not detected in the 5-ft bgs sample at the same location. This likely indicates that benzene is degrading as it migrates through the soil column and that benzene in soil vapor at AOC4-SV12 does not represent a potential risk. Benzene was detected above the current PSL in soil vapor at sub-slab locations AOC4-SS1, AOC4-SS2 and AOC4-SS3. Overall, benzene in sub-slab soil vapor at the Site does indeed exceed PSLs but is only likely to represent a slight risk above background exposures.

9.2 RECOMMENDATIONS

The following are recommendations based on the above conclusions:

- A Removal Action Workplan (RAW) should be developed for the Site to address shallow soils impacted with lead and/or arsenic above their respective RSLs.
- The RAW should also address PCE and benzene soil vapor impacts above the current PSLs.

NOTES:
mg/kg = millgrams per kilogram
Arsenic and lead analyzed by EPA Method 6010B
Derivation of the screening level is explained in text
Yellow highlighted cell = lead value >80 mg/kg or arsenic value >12 mg/kg
Grey hightlighted cell indicates step-out sample
NA = not analyzed

Notes:

ND = Not detected

µg/kg = micrograms per kilogram

Samples analyzed by Environmental Protection Agency Method 8081A.

All samples are composite samples which were composited by the laboratory

*Screening Levels from USEPA RSLs (2018) unless DTSC (2017) has published a screening value of its own, termed the DTSC-SLs Screening levels were divided by six to ensure that no pesticides may have been present in any of the increments that were composited above the screening levels.

APPENDIX A

Ninyo & Moore
Geotechnical & Environmental Sciences Consultants

August 24, 2017
Project No. 210095004

Mr. Patrick Schanen
Los Angeles Unified School District
333 South Beaudry Avenue, 21st Floor
Los Angeles, California 90017

Subject: Preliminary Environmental Assessment Equivalent Work Plan
Reseda High School
18230 Kittridge Street
Reseda, California

Dear Mr. Schanen:

Ninyo & Moore has prepared this Preliminary Environmental Assessment-Equivalent (PEA-E) work plan on behalf of the Los Angeles Unified School District (LAUSD or District) for Reseda High School located at 18230 Kittridge Street in Reseda, California (site, Figure 1). The scope of work consists of collecting soil and soil vapor samples in areas of planned demolition, modernization, and construction activities associated with the Reseda High School Comprehensive Modernization Project (Project; Figure 2).

BACKGROUND

The Los Angeles Unified School District (LAUSD) is planning demolition, modernization, and construction activities associated with the Reseda High School Comprehensive Modernization Project. As part of this effort, Ninyo & Moore prepared a Phase I Environmental Site Assessment (ESA) for the site, dated July 31, 2017. Review of the Phase I ESA reported the following areas of environmental concern (AOCs; Table 1) as defined in ASTM International Standards E1527 13 currently or historically located on site. Site and building locations are shown on Figures 1 and 2, respectively.

Table 1 – Areas of Concern (AOCs)		
AOC	**Reference**	**REC**
Site Concerns		
1. Potential LBP material, arsenic, termiticides, and PCBs in shallow soils.	Phase I ESA (Ninyo & Moore, 2017).	1. OCPs, LBP, arsenic, and PCBs around the exterior of the buildings and in shallow soil surrounding the buildings.
2. Potential PCBs in shallow soils from pad-mounted transformer.	Phase I ESA (Ninyo & Moore, 2017).	2. PCBs in shallow soil surrounding pad-mounted transformer.
3. Area near incinerator.	Phase I ESA (Ninyo & Moore, 2017).	3. Dioxins and Furans potentially in soil.
4. Area near clarifier.	Phase I ESA (Ninyo & Moore, 2017).	4. TPHs, VOCs, Title 22 Metals, and PCBs potentially in soil or soil vapor.
5. Area near suspected location of historical spray paint booths.	Phase I ESA (Ninyo & Moore, 2017).	5. TPHs and VOCs potentially in soil or soil vapor.

Notes:
AOC – area of concern
ESA – Environmental Site Assessment
LBP – lead based paint
OCPs – organochlorine pesticides
PCBs – polychlorinated biphenyls
REC - recognized environmental condition
TPHs – total petroleum hydrocarbons
VOCs – volatile organic compounds

The above AOCs were identified based on the following recognized environmental conditions (RECs) for the site within the planned Project limits:

- Based on the age of the current site buildings, persistent termiticides (organochlorine pesticides [OCPs]), lead (from lead based paint [LBP]), and polychlorinated biphenyls (PCBs) may be present in shallow soil around building foundations.
- PCB-containing materials may be present in soil from on-site pad mounted transformer installed prior to 1979.
- Based on the former use of the incinerator to burn solid wastes, the likely presence of burnt material surrounding the incinerator.
- One inactive clarifier associated with the former automotive shop adjacent to the south of the Industrial Arts building (including a potential vapor encroachment condition).
- The former presence of spray paint booths on-site (including a potential vapor encroachment condition) based on the potential for releases from former leaks.
- Arsenic in shallow soil underneath asphaltic concrete pavement may be present due to the LAUSD's former standard practice of applying herbicides for weed control containing this metal prior to paving.

For the RECs mentioned above, Ninyo & Moore recommended the following:

- In locations of future construction, the possible presence of PCBs, OCPs, arsenic, and lead in shallow soil at the site should be assessed in the form of a PEA-E work plan and in general accordance with California Department of Toxic Substances Control (DTSC) guidance documents.

- If construction or demolition activities are planned for buildings near the clarifier, soil and soil vapor should be evaluated to determine the extent of site contamination, if any.
- This Preliminary Environmental Assessment-Equivalent (PEA-E) work plan is meant to evaluate the RECs reported in the Phase I ESA within the planned Project limits.

PEA FIELD SAMPLING PLAN (FSP)

This field sampling plan (FSP) has been prepared to generally describe the procedures that will be used to conduct the PEA-E investigation at the site. The results from this PEA-E will be used to provide sufficient information to evaluate the potential health risk to students and faculty at the site using the PEA screening evaluations. The sampling rationale is designed to evaluate those locations that will be disturbed during the proposed construction activities and that would likely contain the highest concentrations of constituents of potential concern, if present.

The secondary objective of the sampling is to evaluate the general extent of impact in order to evaluate immediate potential threats and scope removal and remediation needs. Sample results from the FSP will be used to evaluate the need for expedited response/mitigation, locate those areas with the highest levels of impact, and evaluate site remediation, if needed.

The boring locations, sample depths, rationale, and proposed analyses for each sampling location are provided in Table 2. Sampling locations are shown on Figures 3 through 7.

Table 2 – Soil and Soil Vapor Sampling Rationale

Sample Location	Sample ID	Depth (feet bgs)	Proposed Analyses*	Sample Location Rationale
AOC1				
AOC1-B1 through AOC1-B115	AOC1-B1 through AOC1-B115-0.5	0-0.5	LBP, arsenic, OCPs (composite 4 to 6 samples). 10% samples for PCBs	Evaluate potential impacts in shallow soil from LBP, arsenic, OCPs, and PCBs near the site buildings
	AOC1-B1 through AOC1-B115-1.5	1.0-1.5	Archive sample	
	AOC1-B1 through AOC1-B115-2.5	2.0-2.5	Archive sample	
Total Soil Samples from AOC1		**345**		
Total Borings		**115**		
AOC2				
AOC2-B1 and AOC2-B2	AOC2-B1 and AOC2-B2-0.5	0-0.5	PCBs	Evaluate potential impacts in shallow soil from PCBs near pad-mounted transformer
	AOC2-B1 and AOC2-B2-1.5	1.0-1.5	Archive sample	
	AOC2-B1 and AOC2-B2-2.5	2.0-2.5	Archive sample	
Total Soil Samples from AOC2		**6**		
Total Borings		**2**		

Table 2 – Soil and Soil Vapor Sampling Rationale

Sample Location	Sample ID	Depth (feet bgs)	Proposed Analyses*	Sample Location Rationale
AOC3				
AOC3-B1	AOC3-B1-0.5	0-0.5	Dioxins and Furans	Evaluate potential impacts in shallow soil from dioxins and furans near incinerator
	AOC3-B1-1.5	1.0-1.5	Archive sample	
	AOC3-B1-2.5	2.0-2.5	Archive sample	
Total Soil Samples from AOC3		**3**		
Total Borings		**1**		
AOC4				
AOC4-B1 and AOC4-B2	AOC4-B1 and AOC4-B2-5.0	5.0-5.5	TPHs, Title 22 Metals, PCBs, VOCs	Evaluate potential impacts in soil from TPHs, Title 22 Metals, PCBs, and VOCs near clarifier
	AOC4-B1 and AOC4-B2-10.0	10.0-10.5	Archive sample	
	AOC4-B1 and AOC4-B2-15.0	15.0-15.5	Archive sample	
AOC4-SV1 and AOC4-SV2	AOC4-SV1 and AOC4-SV2-5.0	5.0	VOCs	Evaluate potential impacts in soil vapor from VOCs near clarifier
	AOC4-SV1 and AOC4-SV2-15.0	15.0	VOCs	
Total Soil Samples from AOC4		**6**		
Total Soil Vapor Samples from AOC4		**4**		
Total Borings		**2**		
AOC5				
AOC5-SV1 and AOC5-SV2	AOC5-SV1 and AOC5-SV2-5.0	5.0	VOCs	Evaluate potential impacts in soil vapor from VOCs near suspected location of historical spray paint booths
	AOC5-SV1 and AOC5-SV2-15.0	15.0	VOCs	
Total Soil Vapor Samples from AOC5		**4**		
Total Borings		**2**		

Notes:
*OCPs (composite a maximum of 4 samples, around same building at same depth)
*Archive sample for possible future analysis
Duplicate samples will be collected and analyzed at a rate of 10 percent
Equipment blanks will be collected each day for each test method and sampling technique
AOC – area of concern
EPA – United States Environmental Protection Agency
ID – identification
LBP – lead-based paint
OCPs – organochlorine pesticides
PCBs – polychlorinated biphenyls
SV – soil vapor
TPHs – total petroleum hydrocarbons
VOCs – volatile organic compounds

The following table summarizes the requested analyses and the requirements for sample containers, preservations, and holding times.

Table 3 – Soil and Soil Vapor Collection Requirements

Parameter	Methods	Sample Container	Preservative	Holding Time
Soil				
OCPs	EPA 8081A	4-oz glass jar or sleeve	None, 4 °C	14 days
PCBs	EPA 8082	4-oz glass jar or sleeve	None, 4 °C	14 days
Lead	EPA 6010B	4-oz glass jar or sleeve	None, 4 °C	180 days
Arsenic	EPA 6010B	4-oz glass jar or sleeve	None, 4 °C	180 days
Dioxins and Furans	EPA Method 8290A	4-oz glass jar or sleeve	None, 4 °C	30 days
Title 22 Metals	EPA 6010B/7471	4-oz glass jar or sleeve	None, 4 °C	180 days
TPHs	EPA 8015M	4-oz glass jar or sleeve	None, 4 °C	14 days
VOCs	EPA 8260B/5035	3-40 ml glass VOA vials	Sodium bisulfate, methanol	14 days
Soil Vapor				
VOCs	8260B	Gas-tight glass syringes with Teflon® seals	None	30 minutes

Notes:
EPA - United States Environmental Protection Agency
ml - milliliter
OCPs – organochlorine pesticides
oz - ounce
PCBs – polychlorinated biphenyls
TPHs – total petroleum hydrocarbons
VOA – volatile organic analysis
VOCs – volatile organic compounds
°C - degrees Celsius

Field duplicates will be collected and analyzed at a rate of ten percent of primary soil and soil vapor samples. For OCPs, where composite samples will be prepared and analyzed, every 10th composite sample will be prepared (independently) in duplicate and analyzed. Equipment blanks will be collected each day for each test method and sampling technique. A trip blank will be collected at the rate of one per piece of equipment used per day and submitted to the laboratory for analysis.

Ninyo & Moore appreciates the opportunity to be of service to you on this project.

Respectfully submitted,
NINYO & MOORE

Laboratory: TestAmerica Irvine

Narrative

Job Narrative
440-198798-1

Comments
No additional comments.

Receipt
The samples were received on 12/19/2017 1:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 0.4º C and 2.2º C.

Receipt Exceptions
The Chain-of-Custody (COC) was incomplete as received and/or improperly completed. No analysis requested for sample E121817 (440-198798-91). Sample was put on hold. Client emailed request for analysis of this sample, but the request was missed originally. Sample was removed from hold and tests were peformed, but the 7-day extraction hold time for EPA 8081A-Pesticides and EPA 8082 PCBs was missed.

GC Semi VOA
Method(s) 8081A / 8082: The following sample was prepared outside of 7-day preparation holding time due to missing requests on original COC, and laboratory oversight for revised COC: E121817 (440-198798-91).

Method(s) 8082: The matrix spike duplicate (MSD) recoveries for the following sample associated with preparation batch 440-447926 and analytical batch 440-448043 was outside control limits for 1260 due to matrix: (440-198797-G-1-C MSD). The associated laboratory control sample (LCS) recovery met acceptance criteria.

Method(s) 8081A / 8082: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-448689. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method(s) 3510C / 8081A / 8082: Slightly elevated reporting limits are provided for the following sample due to insufficient sample volume (less than 250ml) provided for preparation: E121817 (440-198798-91).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
H	Sample was prepped or analyzed beyond the specified holding time

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Parsons Corporation
Project/Site: LAUSD Reseda H.S., CA

TestAmerica Job ID: 440-198798-1

Laboratory: TestAmerica Irvine

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	EPA Region	Identification Number	Expiration Date
Alaska	State Program	10	CA01531	06-30-18
Arizona	State Program	9	AZ0671	10-14-18
California	LA Cty Sanitation Districts	9	10256	06-30-18
California	State Program	9	CA ELAP 2706	06-30-18
Guam	State Program	9	Cert. No. 17-003R	01-23-18 *
Hawaii	State Program	9	N/A	01-29-18 *
Kansas	NELAP	7	E-10420	07-31-18

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other _____

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☐ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☐ Disposal by Lab ☐ Archive for_____ Months

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	See case narrative.
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
440-198799-1

Comments
No additional comments.

Receipt
The samples were received on 12/19/2017 6:55 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 5.7º C and 5.9º C.

GC Semi VOA
Method(s) 8082: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-448026 and analytical batch 440-448300.The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method(s) 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries and/or precision of Lead for preparation batch 440-448040 and analytical batch 440-448405 were outside control limits. The associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Method Summary

Client: Parsons Corporation
Project/Site: LAUSD Reseda H.S., CA

TestAmerica Job ID: 440-198799-1

Method	Method Description	Protocol	Laboratory
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	TAL IRV
6010B	Metals (ICP)	SW846	TAL IRV

Protocol References:

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery is outside acceptance limits.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Parsons Corporation
Project/Site: LAUSD Reseda H.S., CA

TestAmerica Job ID: 440-198799-1

Laboratory: TestAmerica Irvine

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	EPA Region	Identification Number	Expiration Date
Alaska	State Program	10	CA01531	06-30-18
Arizona	State Program	9	AZ0671	10-14-18
California	LA Cty Sanitation Districts	9	10256	06-30-18
California	State Program	9	CA ELAP 2706	06-30-18
Guam	State Program	9	Cert. No. 17-003R	01-23-18 *
Hawaii	State Program	9	N/A	01-29-18 *
Kansas	NELAP	7	E-10420	07-31-18
Nevada	State Program	9	CA015312018-1	07-31-18
New Mexico	State Program	6	N/A	01-29-18 *
Northern Mariana Islands	State Program	9	MP0002	01-29-17 *
Oregon	NELAP	10	4028	01-29-18 *
USDA	Federal		P330-15-00184	07-08-18
Washington	State Program	10	C900	09-03-18

* Accreditation/Certification renewal pending - accreditation/certification considered valid.

440-198799 Chain of Custody

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other _____

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☒ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☒ Disposal by Lab ☐ Archive for _____ Months

Special Instructions/QC Requirements & Comments:

5.9 5.7
6.1 5.9

Custody Seals Intact: ☐ Yes ☐ No | Custody Seal No.: | Cooler Temp. (°C): Obs'd: 6.1 Corr'd: 5.9 | Therm ID No.: 1284

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
440-198799-2

Comments
No additional comments.

Receipt
The samples were received on 12/19/2017 6:55 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 5.7º C and 5.9º C.

Dioxin
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Dioxin Prep
Method(s) 8290, HRMS-Sox: Due to the matrix, the initial volume used for the following samples deviated from the standard procedure: AOC3-B1-D0.5 (440-198799-49) and AOC3-B1-D0.5-DUP (440-198799-52). The reporting limits (RLs) have been adjusted proportionately.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

Dioxin

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
q	The reported result is the estimated maximum possible concentration of this analyte, quantitated using the theoretical ion ratio. The measured ion ratio does not meet qualitative identification criteria and indicates a possible interference.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other 1

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☑ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☑ Disposal by Lab ☐ Archive for _____ Months

Special Instructions/QC Requirements & Comments:

Custody Seals Intact: ☐ Yes ☐ No | Custody Seal No.: | Cooler Temp. (°C): Obs'd:_____ Corr'd:_____ Therm ID No.:_____

Comments
No additional comments.

Receipt
The samples were received on 12/20/2017 6:25 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 2.0º C and 2.7º C.

Receipt Exceptions
The following samples were received at the laboratory without a sample collection date documented on the chain of custody: AOC1-B4-D0.5 (440-198876-72), AOC1-B4-D1.5 (440-198876-73), AOC1-B4-D2.5 (440-198876-74), AOC1-B5-D0.5 (440-198876-75), AOC1-B5-D1.5 (440-198876-76), AOC1-B5-D2.5 (440-198876-77), AOC1-B8-D0.5 (440-198876-78), AOC1-B8-D1.5 (440-198876-79), AOC1-B8-D2.5 (440-198876-80), AOC1-B13-D0.5 (440-198876-81) and AOC1-B13-D1.5 (440-198876-82). The client was contacted and sampling date of 12/20/17 was confirmed.

GC Semi VOA
Method(s) 8081A, 8082: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-448247. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method(s) 3510C / 8081A / 8082: Elevated reporting limits are provided for the following sample due to insufficient sample volume (less than 250ml) provided for preparation: E122017 (440-198876-12).

Method(s) 3546 / 8082: The following samples had smaller initial amount used due to the nature of the sample matrix: AOC1-B21-D0.5 (440-198876-1), AOC1-B21-D0.5DUP (440-198876-4), AOC1-B18-D0.5 (440-198876-5), AOC1-B18-D0.5DUP (440-198876-8), AOC1-B17-D0.5 (440-198876-9), AOC1-B28-D0.5 (440-198876-19), AOC2-B2-D0.5 (440-198876-22), AOC2-B1-D0.5 (440-198876-25), AOC1-B12-D0.5 (440-198876-48). Elevated reporting limits (RLs) are provided.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Surrogate Legend

DCB = DCB Decachlorobiphenyl (Surr)

Method: 8082 - Polychlorinated Biphenyls (PCBs) by Gas Chromatography

Matrix: Water **Prep Type: Total/NA**

		Percent Surrogate Recovery (Acceptance Limits)									
		DCB2									
Lab Sample ID	Client Sample ID	(26-115)									
440-198876-12	E122017	79									
LCS 440-448247/4-A	Lab Control Sample	82									
LCSD 440-448247/5-A	Lab Control Sample Dup	84									
MB 440-448247/1-A	Method Blank	89									

Surrogate Legend

DCB = DCB Decachlorobiphenyl (Surr)

Method Summary

Client: Parsons Corporation
Project/Site: LAUSD Reseda H.S., CA

TestAmerica Job ID: 440-198876-1

Method	Method Description	Protocol	Laboratory
8081A	Organochlorine Pesticides (GC)	SW846	TAL IRV
8082	Polychlorinated Biphenyls (PCBs) by Gas Chromatography	SW846	TAL IRV
6010B	Metals (ICP)	SW846	TAL IRV

Protocol References:

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Parsons Corporation
Project/Site: LAUSD Reseda H.S., CA

TestAmerica Job ID: 440-198876-1

Laboratory: TestAmerica Irvine

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	EPA Region	Identification Number	Expiration Date
Alaska	State Program	10	CA01531	06-30-18

Subject: FW: Reseda 2017-12-20 CoCs
Attachments: SKMBT_36317122116180.pdf

-External Email-

I just looked and realized my tech did not list OCPs on the equipment blank. Can you please add? This is for the samples collected yesterday (12/20).
Thanks
J

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	No sample date on page 7of10 of COC, logged in per container labels.
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	False	No date page 7 of 10 of COC, logged in per container labels.
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
440-199093-1

Comments
No additional comments.

Receipt
The samples were received on 12/21/2017 7:12 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 0.4º C and 1.5º C.

Receipt Exceptions
The matrix for the following sample did not match the information listed on the Chain-of-Custody (COC): E122117 (440-199093-67). The matrix of sample listed on COC is solid but sample is water.

GC Semi VOA
Method(s) 8081A, 8082: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 440-448689. The laboratory control sample (LCS) was performed in duplicate to provide precision data for this batch.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
Method(s) 3510C / 8081A / 8082: Slightly elevated reporting limits are provided for the following sample due to insufficient sample volume (less than 250ml) provided for preparation: E122117 (440-199093-67).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Parsons Corporation
Project/Site: LAUSD Reseda H.S., CA

TestAmerica Job ID: 440-199093-1

Laboratory: TestAmerica Irvine

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	EPA Region	Identification Number	Expiration Date
Alaska	State Program	10	CA01531	06-30-18
Arizona	State Program	9	AZ0671	10-14-18

440-199093 Chain of Custody

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other _____

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☑Non-Hazard ☐Flammable ☐Skin Irritant ☐Poison B ☐Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐Return to Client ☑Disposal by Lab ☐Archive for _____ Months

Special Instructions/QC Requirements & Comments:

Custody Seals Intact: ☐ Yes ☐ No | Custody Seal No.: | Cooler Temp. (°C): Obs'd:_____ Corr'd:_____ Therm ID No.:_____

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Refer to Job Narrative for details.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Job Narrative
440-198798-2

Comments
Only the additional total Lead or Arsenic results, and the STLC Lead results are included in this report, per client's 1/3/18 email request.

Receipt
The samples were received on 12/19/2017 1:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 0.4° C and 2.2° C.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Accreditation/Certification Summary

Client: Parsons Corporation
Project/Site: LAUSD Reseda H.S., CA

TestAmerica Job ID: 440-198798-2

Laboratory: TestAmerica Irvine

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

Authority	Program	EPA Region	Identification Number	Expiration Date
Alaska	State Program	10	CA01531	06-30-18
Arizona	State Program	9	AZ0671	10-14-18

Dennis
Can you have Pb run for STLC for the following soil samples?
AOC1-B6-D0.5
AOC1-B34-D0.5
AOC1-B108-D0.5
AOC1-B100-D0.5
Thanks,
Justin

Good morning Justin,

AOC3-B1, primary and dup, are going to be reported separately as job J198799-2.

I will go ahead and make the changes you have outlined in the email below; this email should be sufficient enough.

DENNIS TRAN

-External Email-

Hi Dennis
Patty is the project manager for a job that we conducted at the Reseda High School. I had a question regarding the analysis of dioxin and furans for lab report J198799. We requested a primary sample and dup to be analyzed but it was not reported.
I also submitted number of samples to be held. I would like to run some of those samples as outlined below. Do you need me to amend the original COC to request the analysis or submit a new COC? Or will this email suffice? (Lab ID numbers for the samples are J198798, J198799, J198876, J199093). Please let me know if you need further clarification.
Thanks

Justin King

Subject: Reseda

Hi Patty
I did not see the results of the dioxin and furan testing for AOC3-B1. Were you going to report that separately?
Also, I will need the follow held samples analyzed.

- AOC1-B1-D1.5 and AOC1-B1-D2.5 for Arsenic.
- AOC1-B6-D1.5 and AOC1-B6-D2.5 for Lead
- AOC1-B8-D1.5 and AOC1-B8-D2.5 for Arsenic
- AOC1-B10-D1.5 and AOC1-B10-D2.5 for Arsenic
- AOC1-B22-D1.5 and AOC1-B22-D2.5 for Arsenic
- AOC1-B34-D1.5 and AOC1-B34-D2.5 for Lead
- AOC1-B58-D1.5 and AOC1-B58-D2.5 for Arsenic
- AOC1-B64-D1.5 and AOC1-B64-D2.5 for Arsenic
- AOC1-B77-D1.5 and AOC1-B77-D2.5 for Arsenic
- AOC1-B78-D1.5 and AOC1-B78-D2.5 for Arsenic

- AOC1-B81-D1.5 and AOC1-B81-D2.5 for Arsenic
- AOC1-B91-D1.5 and AOC1-B91-D2.5 for Arsenic
- AOC-B100-D1.5 and AOC1-B100-D2.5 for Lead
- AOC1-B108-D1.5 and AOC1-B109-D2.5 for Arsenic and Lead
- AOC1-B112-D1.5 and AOC1-B112-D2.5 for Arsenic

Please let me know if I need to amend the individual COCs to include the analysis request or send you a new COC.
Thanks
Justin

Comments
Only the results for additional TCLP test that was requested on 1/12/18 are included in this report.

Receipt
The samples were received on 12/19/2017 1:10 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 0.4º C and 2.2º C.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

No problem. When do you think they will be ready?
Also, Can you run TCLP on **AOC1-B34-D0.5.**
It is over 5 for STLC.
Thanks
Justin

Subject: RE: TestAmerica additional metals report files from 440-198799-3 LAUSD Reseda H.S., CA

Justin,

Sorry! We ran the wrong samples! We tested the AOC3-B1 sample set instead of the AOC1-B1 set. I need to add the tests to job 440-198876 which has the correct samples in it. I just double-checked and all the other samples were correct, only the B1 samples were wrong. I will get the tests started on the correct B1 samples right away.

Sorry again for the mistake!

Thanks,

PATTY MATA
Project Manager

List Number: 1

Creator: Soderblom, Tim

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	N/A	Not present
Sample custody seals, if present, are intact.	N/A	Not Present
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	False	See case narrative.
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Comments
This report was revised on 1/12/18 to correct the list of additional samples reported for Arsenic.

Only the additional total Arsenic results are included in this report, per client's 1/3/18 email request.

Receipt
The samples were received on 12/19/2017 6:55 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 2 coolers at receipt time were 5.7º C and 5.9º C.

Metals
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

440-198799 Chain of Custody

Preservation Used: 1= Ice, 2= HCl; 3= H2SO4; 4=HNO3; 5=NaOH; 6= Other _____

Possible Hazard Identification:
Are any samples from a listed EPA Hazardous Waste? Please List any EPA Waste Codes for the sample in the Comments Section if the lab is to dispose of the sample.

☒ Non-Hazard ☐ Flammable ☐ Skin Irritant ☐ Poison B ☐ Unknown

Sample Disposal (A fee may be assessed if samples are retained longer than 1 month)

☐ Return to Client ☒ Disposal by Lab ☐ Archive for _____ Months

Special Instructions/QC Requirements & Comments:

5.9 5.7
6.1 5.9

Custody Seals Intact: ☐ Yes ☐ No | Custody Seal No.: | Cooler Temp. (°C): Obs'd: 6.1 Corr'd: 5.9 | Therm ID No.: 1284
