

Green Schoolyards for All Plan

Prioritization Methodology

The criteria used to prioritize capital improvements that address the District's goal of providing students with green/natural spaces, as focused in the *"Green Schools for All Resolution"*, is developed as follows:

- 1) Special focus on elementary schools with 10% or less green/natural schoolyards**
- 2) Focus on schools within communities in greatest need for the benefits of green/natural schoolyards**

Based on the established priority goals, approximately 200 elementary schools are identified as having 10% or less green/natural schoolyards. The calculation measures each elementary school's schoolyard and the green/natural features within the schoolyard. The calculation establishes an eligibility list of "Priority Schools" all having 10% or less green/natural schoolyards. The Priority Schools list is based on current information collected in the District's CAFM database. The data is continually updated and as upgrades are made at school sites and/or new information is identified school sites may move into or out of the eligibility list.

Prioritizing within the eligibility list is further accomplished by assigning a ranking based on a weighted calculation of 75% applied to the CalEnviroScreen (CES) score and 25% applied to the Extreme Heat Temperature score. These scoring factors demonstrate the priority need for targeting initial resources in communities with the greatest need for green/natural schoolyards, as follows:

- 1) "The CalEnviroScreen (CES) is a mapping tool and dataset that helps identify California communities that are most affected by many sources of pollution, and where people are often especially vulnerable to pollution's effects. It uses environmental, health, and socioeconomic information to produce scores for every census tract in the state. The scores are mapped so that different communities can be compared. An area with a high score is one that experiences a much higher pollution burden than areas with low scores. CES ranks communities based on data that are available from state and federal government sources. Latest updated was made in October 2021"**¹
- 2) "Extreme Heat Temperature is a tool and dataset that explores the temperature of extreme heat days. This data is derived from daily maximum temperature, 30-year average for 1976-2005, that includes baseline, mid-century, and late-century projections by 6km grid cell."**²

1. The Office of Environmental Health Hazard Assessment (OEHHHA) & California Environmental Protection Agency (CalEPA) - CalEPA asked OEHHHA to develop CalEnviroScreen to identify communities suffering from cumulative impacts of multiple pollutants and people who are vulnerable to pollution's effects. Source: <https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-40>

2. The Cal-Adapt Analytics Engine is a climate data platform developed for California's Fifth Climate Change Assessment. Use cloud computing resources to access downscaled CMIP6 climate data and analytics co-produced by stakeholders, policy makers, scientists and developers.
