3. **Development Area Breakdowns for CalEEMod Modeling**

1. Air Quality and Greenhouse Gas Regulatory and Contextual Information

Regulatory Settings

Air Quality

Federal

Clean Air Act (CAA)

The Clean Air Act regulates sources of air emissions within the United States. The CAA requires U.S. Environmental Protection Agency (EPA) to set National Ambient Air Quality Standards (NAAQS) for pollutants that are common in outdoor air, considered harmful to public health and the environment, and that come from numerous and diverse sources. The six criteria pollutants regulated by the EPA through the NAAQS are: CO, NO2, O3, particulate matter (PM-10, PM-2.5), SO2, and Pb. The EPA designates areas in the nation as in attainment, nonattainment, or maintenance in regard to the NAAQS for each criteria pollutant. For nonattainment or maintenance areas states are tasked with the development of State Implementation Plans (SIPs) to bring the area into attainment. Areas must be brought into attainment by a certain date for each pollutant. This attainment date is set by the EPA according to the severity of nonattainment. Los Angeles County is currently in nonattainment for 8-Hour Ozone and PM 2.5 standards (and Pb for one small area not relevant to the Project). The EPA also establishes vehicle emission standards for vehicles sold in states other than California, which maintains stricter vehicle emission standards than the EPA.

State

California Clean Air Act (CCAA)

The California Clean Air Act (CCAA) was adopted in 1988 to require state air districts to meet California Ambient Air Quality Standards (CAAQS) developed by the California Air Resources Board (CARB), which is responsible for administering the CCAA. The CAAQS meet or exceed the NAAQS and in some cases use calculation methods that are different from the NAAQS. CARB oversees the functions of local air pollution control districts and air quality management districts, which in turn administer air quality activities at the

regional and county levels as part of the state's SIPs. The CCAA requires CARB to designate areas within California as either attainment or nonattainment for each criteria pollutant based on whether the CAAQS have been achieved. Under state standards, Los Angeles County is designated as a nonattainment area for O3, PM-10, and PM-2.5. Exceedances that are affected by highly irregular or infrequent events are not considered violations of a state standard and are not used as a basis for designating areas as nonattainment.

Ambient Air Quality Standards

National and state ambient air quality standards shown in **Table 1, Ambient Air Quality Standards,**[1] are the air quality levels that are considered safe, with an adequate margin of safety, to protect the public health and welfare of "sensitive receptors," which include the elderly, young children, the acutely and chronically ill (e.g., those with cardio-respiratory disease, including asthma), and persons engaged in strenuous work or exercise. Healthy adults can tolerate occasional exposure to air pollutant concentrations considerably above these minimum standards before adverse effects are observed.

Toxic Air Contaminants

Toxic air contaminants (TACs) are airborne pollutants identified by CARB which may cause or contribute to an increase in deaths or in serious illness, or which may pose a present or potential hazard to human health. TACs are not criteria pollutants and are regulated separately. The USEPA regulates TACs through technology-based requirements which are implemented by state & local agencies. California regulates TACs through the air toxics program (H&SC §§ 39660 et seq.) and the Air Toxics "Hot Spots" Information and Assessment Act (H&SC §§ 44300 et seq.). Sources of TACs include some industrial and commercial activities, and mobile emissions from cars and trucks, particularly diesel particulate matter (DPM). The "Hot Spots" Act applies to stationary sources and requires operators of specified facilities (those that produce TACs) to submit emission inventories to the AQMD. Those deemed as high priority must prepare a health risk assessment which may result in notification to the surrounding population and development of a risk reduction plan. There are also "industry-wide" inventories and assessed risks of small business facilities with emissions that are easily characterized such as gas stations, small auto body shops, small dry cleaners, plating shops, and fiberglass product manufacturers. This information can be used when considering siting such a facility near a sensitive receptor, or vice versa.

California Code of Regulations

The California Code of Regulations (CCR) is the official compilation and publication of state regulations. Regulations pertaining to air quality are Section 2485 of Title 13 which states the idling of all diesel-fueled commercial vehicles (weighing over 10,000 pounds) during construction shall be limited to five minutes at any location; and Section 93115 of Title 17 which states that operations of any stationary, diesel-fueled, compression-ignition engines shall meet specified fuel and fuel additive requirements and emissions standards.

Table 1
Ambient Air Quality Standards

Ambient Air Quality Standards						
Pollutant	**Averaging Time**	**California Standards** [1]		**National Standards** [2]		
		Concentration [3]	**Method** [4]	**Primary** [3,5]	**Secondary** [3,6]	**Method** [7]
Ozone (O_3)[8]	1 Hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m^3)		0.070 ppm (137 µg/m^3)		
Respirable Particulate Matter (PM10)[9]	24 Hour	50 µg/m^3	Gravimetric or Beta Attenuation	150 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m^3		—		
Fine Particulate Matter (PM2.5)[9]	24 Hour	—	—	35 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m^3	Gravimetric or Beta Attenuation	12.0 µg/m^3	15 µg/m^3	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)		—	—	
Nitrogen Dioxide (NO_2)[10]	1 Hour	0.18 ppm (339 µg/m^3)	Gas Phase Chemiluminescence	100 ppb (188 µg/m^3)	—	Gas Phase Chemiluminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)		0.053 ppm (100 µg/m^3)	Same as Primary Standard	
Sulfur Dioxide (SO_2)[11]	1 Hour	0.25 ppm (655 µg/m^3)	Ultraviolet Fluorescence	75 ppb (196 µg/m^3)	—	Ultraviolet Flourescence; Spectrophotometry (Pararosaniline Method)
	3 Hour	—		—	0.5 ppm (1300 µg/m^3)	
	24 Hour	0.04 ppm (105 µg/m^3)		0.14 ppm (for certain areas)[11]	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas)[11]	—	
Lead[12,13]	30 Day Average	1.5 µg/m^3	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m^3 (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average	—		0.15 µg/m^3		
Visibility Reducing Particles[14]	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	**No National Standards**		
Sulfates	24 Hour	25 µg/m^3	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m^3)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 µg/m^3)	Gas Chromatography			

See footnotes on next page

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24 hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 $\mu g/m^3$ is equal to or less than one. For PM2.5, the 24 hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.

3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

4. Any equivalent measurement method which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.

5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.

6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

7. Reference method as described by the U.S. EPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the U.S. EPA.

8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.

9. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 $\mu g/m^3$ to 12.0 $\mu g/m^3$. The existing national 24-hour PM2.5 standards (primary and secondary) were retained at 35 $\mu g/m^3$, as was the annual secondary standard of 15 $\mu g/m^3$. The existing 24-hour PM10 standards (primary and secondary) of 150 $\mu g/m^3$ also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.

10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

11. On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

    Note that the 1-hour national standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour national standard to the California standard the units can be converted to ppm. In this case, the national standard of 75 ppb is identical to 0.075 ppm.

12. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 $\mu g/m^3$ as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

14. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Regional

The air basins are geographic areas that share common airsheds. Administratively, cities and counties either fall under the authority of a county air pollution control district (APCD) or a multi-county air quality management district (AQMD). These local districts have the responsibility of administering and enforcing the CCAA and controlling air pollution emissions from stationary sources within their jurisdictions. The air quality plans developed by these bodies are part of California's SIPs. The project site falls within the boundaries of the SCAQMD which is responsible for developing the regional Air Quality Management Plan (AQMP). The 2022 AQMP is a regional blueprint for achieving the CAAQS, and it represents a comprehensive analysis of emissions, meteorology, atmospheric chemistry, regional growth projections, and the impact of existing control measures. The Southern California Association of Governments (SCAG) develops portions of the AQMP that address transportation control measures, land use, and growth projections within districts that have not met air quality standards. The 2022 AQMP relies on the growth estimates and transportation control measures found in the SCAG 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS). The land use and transportation control measures of the RTP/SCS are a component of the SIP used to reach attainment.

The SCAQMD has also promulgated rules for the regulation of air pollution sources within the air basin. These include:

- Rule 402 – Nuisance: This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material, which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.
- Rule 403 – Fugitive Dust: This rule requires projects to prevent, reduce or mitigate fugitive dust emissions from a site. Rule 403 restricts visible fugitive dust to the project property line, restricts the net PM_{10} emissions to less than 50 micrograms per cubic meter ($\mu g/m^3$), and restricts the tracking out of bulk materials onto public roads. Additionally, projects must utilize one or more of the best available control measures (identified in the tables within the rule). Best available control measures may include adding freeboard to haul vehicles, covering loose material on haul vehicles, watering, using chemical stabilizers, and/or ceasing all activities. Finally, a contingency plan may be required if so determined by the USEPA.
- Rule 1113 – Architectural Coatings: This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories.
- Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities: This rule requires owners and operators of any demolition or renovation activity and the associated disturbance of asbestos-containing materials, any asbestos storage facility, or any active waste disposal site to implement work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials.

SCAQMD Emissions Thresholds

The SCAQMD's 2022 AQMP is the region's applicable air quality plan. The AQMP is partly implemented through SCAGs 2020-2045 RTP/SCS as the land use assumptions underlying the AQMP are derived from the RTP/SCS. However, compliance with the AQMP is primarily measures through project-level significance thresholds the SCAQMD has established. These significance thresholds are used to assess regional and localized impacts of project-related criteria pollutant emissions. Non-exceedance of these thresholds is used to determine consistency with the AQMP.

Local

Local governments are responsible for land use planning and review, mitigation of any air quality impacts that result from development projects, development and maintenance of local transportation infrastructure, and development and implementation of local air quality programs, if any. The Project is exempt from local land use regulations and as such is subject to applicable state and regional regulations in this regard.

Greenhouse Gasses

Federal

Clean Air Act

The U.S. Environmental Protection Agency (EPA) is responsible for implementing federal policy to address GHGs. In Massachusetts v. EPA (549 US 497 [2007]) the U.S. Supreme Court found that CO_2 and other greenhouse gases (GHGs) are pollutants under the Clean Air Act (CAA) and could be regulated by the EPA. The Court did not require the EPA to regulate GHG emissions, but indicated the agency must decide whether GHGs cause or contribute to air pollution that is reasonably anticipated to endanger public health or welfare. On December 7, 2009 the EPA administrator made two finding regarding GHGs under Section 202(a) of the CAA:

> Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed greenhouse gases (CO2, methane [CH_4], nitrous oxide [N_2O], hydrofluorocarbons [HFCs], perfluorocarbons [PFCs], and sulfur hexafluoride [SF_6]) in the atmosphere threaten the public health and welfare of current and future generations.
>
> Cause or Contribute Finding: The Administrator finds that the combined emissions of these well-mixed greenhouse gases from new motor vehicles and new motor vehicle engines contribute to the greenhouse gas pollution that threatens public health and welfare.

These findings did not impose any requirements; however, the action was a prerequisite for implementing GHG emissions standards for vehicles and other sectors.[2] Subsequently these findings were used to modify existing Corporate Average Fuel Economy (CAFE) standards.

[2] United States Environmental Protection Agency, Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act, Accessed March 13, 2023 at: https://www.epa.gov/climate-change/endangerment-and-cause-or-contribute-findings-greenhouse-gases-under-section-202a.

In March 2020, the U.S. Department of Transportation (USDOT) and the EPA issued the Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule, which further amended existing CAFE standards and tailpipe CO2 emissions standards for passenger cars and light trucks and established new standards covering model years 2021 through 2026.

Corporate Average Fuel Economy (CAFE) Standards

First enacted by Congress in 1975, the purpose of the Corporate Average Fuel Economy (CAFE) standards was to reduce energy consumption by increasing the fuel economy of passenger cars and light trucks. On April 1, 2010, the National Highway Traffic Safety Administration (NHTSA) and EPA issued a joint final rule establishing a new national program to regulate passenger cars and light trucks in order to improve fuel economy and reduce GHG emissions. In 2012, NHTSA established final passenger car and light truck CAFE standards for model years 2017-2021, which the agency projected would require an average combined fleet-wide fuel economy of 40.3-41.0 mpg in model year 2021. As part of the same rulemaking action the EPA issued GHG standards which were projected to require an average of 163 grams/mile of CO_2 in model year 2025. In March 2022 the NHTSA finalized CAFE Standards for model years 2024-2026 which require an industry-wide fleet average of approximately 49 mpg for passenger cars and light trucks in model year 2026, by increasing fuel efficiency by 8% annually in 2024 and 2025, and 10% in 2026. Relative to model year 2021 average standards are increased nearly 10 miles per gallon.

Construction Equipment Emission Standards

The EPA sets emission standards for construction equipment. Tier 1 standards were adopted in 1994 for new nonroad diesel engines over 50 hp, to be phased-in from 1996 to 2000. In 1998 Tier 1 standards were then applied to all equipment under 350 hp. Tier 2 and Tier 3 standards for all equipment were then introduced with phase-in schedules from 2000 to 2008. The Tier 1-3 standards are met through advanced engine design, meaning emission reductions generally cannot be obtained through the use of exhaust gas aftertreatment.

In 2004 EPA signed the final rule introducing Tier 4 emission standards, which are phased-in over the period of 2008-2015. The Tier 4 standards require that emissions of PM and NOx be further reduced from existing standards by about 90%. Tier 4 emission reductions can be achieved through the use of control technologies, including exhaust gas aftertreatment. Tier 4 standards also included reductions in sulfur content in nonroad diesel fuels, which was not present in previous standards.

These standards cover mobile nonroad diesel engines of all sizes, the sort of equipment used in construction, agricultural and industrial uses. Tier 1 standards were phased-in from 1996 to 2000, Tier 2 from 2001 to 2006, and Tier 3 standards were phased-in from 2006 to 2008. Equipment must meet the standards in place when they were built. However, rules governing the replacement or modification of equipment are geared toward retiring older equipment.

<u>State</u>

Section 38505(g) of the California Health and Safety Code defines GHGs to include the following compounds: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3). Two important ways in which these gases differ from each other are their ability to absorb energy (their "radiative efficiency"), and how long they stay in the atmosphere (also known as their "lifetime"). The ability of equivalent masses of each GHG to trap heat in

the atmosphere is measured by its global warming potential (GWP).[3] CO_2 is the reference gas used for GWP, and it has a GWP of one. The GWP of other GHGs are determined based on their heat trapping potential relative to CO_2. Because of this, GHG emissions are commonly expressed in terms of carbon dioxide equivalents (CO_2e), where CO_2e is calculated by the quantity of each GHG multiplied by its associated GWP factor. Below is a description of each GHG emission as described by the California Climate Action Registry (CCAR) General Reporting Protocol.[4]

- Carbon Dioxide (CO_2): Consisting of a single carbon and two oxygen atoms, CO_2 is the most common of the six primary GHG emissions, and it provides the reference point for the GWP of other gases. Thus, the GWP of CO_2 is equal to one.

- Nitrous Oxide (N_2O): Consisting of two nitrogen atoms and a single oxygen atom, N_2O possesses a GWP of 310 and is typically generated as a result of soil cultivation practices, particularly the use of commercial and organic fertilizers, fossil fuel combustion, nitric acid production, and biomass burning.

- Methane (CH4): Consisting of a single carbon atom and four hydrogen atoms, CH_4 possesses a GWP of 21 and is produced through the anaerobic decomposition of waste in landfills, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

- Hydrofluorocarbons (HFCs): Primarily used as refrigerants, HFCs consist of a class of gases containing hydrogen, fluorine, and carbon. They possess a range of high and very high GWP values from 120 to 12,000.

- Perfluorocarbons (PFCs): PFCs consist of a class of gases containing carbon and fluorine and are originally introduced as alternatives to ozone depleting substances. They are typically emitted as by-products of industrial and manufacturing processes and possess GWPs ranging from 5,700 to 11,900.

- Sulfur Hexafluoride (SF_6): SF_6 consists of a single sulfur atom and six fluoride atoms, possessing a very high GWP of 23,900. SF_6 is primarily used in electrical transmission and distribution systems.

Senate Bill 1078 and Senate Bill 107, The California Renewables Portfolio Standard

The state enacted Senate Bill (SB) 1078 in 2002, establishing the Renewable Portfolio Standards (RPS) program and requiring retail sellers of electricity, including electrical corporations, community choice aggregators, and electric service providers, to purchase a specified minimum percentage of electricity generated by eligible renewable energy resources such as wind, solar, geothermal, small hydroelectric, biomass, anaerobic digestion, and landfill gas. The legislation set a target by which 20 percent of the state's electricity would be generated by renewable sources. Senate Bill 1078 requires each electrical corporation to increase its total procurement of eligible renewable energy resources by at least one percent per year so that 20 percent of its retail sales are procured from eligible renewable energy resources. If an electrical corporation fails to meet an annual target, it would be required to procure additional eligible renewable resources in subsequent years to compensate for the

[3] U.S. Environmental Protection Agency, Greenhouse Gas Emissions Understanding Global Warming Potentials, Accessed on March 17, 2023 at: https://www.epa.gov/ghgemissions/understanding-global-warming-potentials.

[4] California Climate Action Registry, General Reporting Protocol Version 3.1, January 2009.

shortfall. The state enacted SB 107 in 2006, which modified the RPS to require that at least 20 percent of electricity retail sales be served by renewable energy resources by 2010.[5]

Assembly Bill 1493, The Pavley Standards

In July 2002, the state enacted Assembly Bill (AB) 1493, which directed the CARB to develop and adopt regulations that achieve the maximum feasible reduction of GHGs emitted by passenger vehicles and light-duty trucks, beginning with model year 2009. In September 2004, pursuant to this directive, the CARB approved regulations to reduce GHG emissions from new motor vehicles beginning with the 2009 model year. These regulations created what are referred to as the Pavley Standards. In September 2009, the CARB adopted amendments to the Pavley Standards to reduce GHG emissions from new motor vehicles through the 2016 model year. These regulations created what are referred to as the Pavley II Standards. It is expected that the Pavley regulations will reduce GHG emissions from California passenger vehicles by about 34 percent below 2016 levels by 2025, as well as improve fuel efficiency and reduce motorists' costs.[6]

Executive Order S-3-05

Former Governor Schwarzenegger's 2005 Executive Order S-3-05 included the following GHG emission reduction targets: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; and by 2050, reduce GHG emissions to 80 percent below 1990 levels. To meet the targets, the Governor directed several state agencies to cooperate in the development of a CAP. The Secretary of the California Environmental Protection Agency (Cal EPA) leads the Climate Action Team (CAT), whose goal is to implement global warming emission reduction programs identified in the CAP and to report biannually on the progress made toward meeting the emission reduction targets established in the Executive Order.

Assembly Bill 32, The Global Warming Solutions Act of 2006

California Assembly Bill 32 (AB 32), the California Global Warming Solutions Act of 2006, provided authorization to CARB to develop regulations and market mechanisms to reach the GHG emissions goals established by Executive Order S-3-05 in 2005. Pursuant to AB 32, CARB identified 427 million MT CO_2e as the total statewide aggregated 1990 GHG emissions level, which served as the 2020 emissions limit. The state achieved its 2020 GHG emissions reductions target of returning to 1990 levels in 2016.

Executive Order B-30-15

In 2015, Governor Brown issued Executive Order B-30-15, which created an interim statewide GHG emission reduction target to reduce GHG emissions to 40 percent below 1990 levels by 2030, replacing the 2005 target.

6 California Air Resources Board (ARB), California Air Resources Board Approves Advances Clean Car Rules, Accessed on November 8, 2021 at: https://ww2.arb.ca.gov/news/california-air-resources-board-approves-advanced-clean-car-rules.

Senate Bill 32, California Global Warming Solutions Act of 2016

California Senate Bill 32 (SB 32), the California Global Warming Solutions Act of 2016: emissions limit, was passed in 2016 as a follow-up to AB 32, authorizing CARB to create regulations in pursuit of the GHG emissions target set in the 2015 executive order.

Executive Order B-55-18

Executive Order B-55-18, issued by Governor Brown in 2018, established a statewide policy goal to achieve carbon neutrality as soon as possible and no later than 2045, and to achieve and maintain net negative emissions thereafter. The Order states that this new goal is in addition to the prior statewide targets for reduction of GHG emissions.

Assembly Bill 1279, California Climate Crisis Act

Assembly Bill 1279, known as the California Climate Crisis Act, was enacted September 16, 2022. It codifies previous executive orders by requiring California to achieve net zero greenhouse gas emissions as soon as possible, but no later than 2045, and to achieve and maintain net negative GHG emissions thereafter. It also requires that statewide anthropogenic GHG emissions be reduced to at least 85 percent below 1990 levels by 2045.

Climate Change Scoping Plan

As required by AB 32, CARB was tasked with preparing a scoping plan that identified strategies for reducing GHG emissions. The first Climate Change Scoping Plan was adopted in December 2008 and gets updated every 5-years. So far there have been three updates on the Scoping Plan. Each update builds upon the existing strategies and recommendations from the previous plan and identifies opportunities to leverage existing and new funds.

The 2022 Climate Change Scoping Plan was finalized in December 2022 and is focused on the goal of obtaining carbon neutrality by 2045 or earlier. The 2022 Scoping Plan specifically:[7]

- Identifies a path to reduce GHG emissions by 85 percent below 1990 emissions no later than 2045.
- Identifies technologically feasible, cost-effective means to achieve carbon neutrality by 2045.
- Focuses on strategies for reducing California's dependency on petroleum to provide consumers with clean energy options that address climate change, improve air quality, and support economic growth and clean sector jobs.
- Integrates equity and protecting California's most impacted communities as a driving principle throughout the document.
- Incorporates the contribution of natural and working lands to the state's GHG emissions, as well as its role in achieving carbon neutrality.

[7] California Air Resources Board, 2022 Scoping Plan for Achieving Carbon Neutrality, November 16, 2022.

- Relies on the most up to date science, including the need to deploy all viable tools to address the existential threat that climate change presents, including carbon capture and sequestration as well a direct air capture.

GHG emission targets set in the Scoping Plan are attained by setting statewide control measures, such as the Pavley standards or Title 24 standards, which address specific sources of emissions, and by addressing land use on a regional level through regional transportation plans and sustainable communities strategies developed by metropolitan planning organizations.

Senate Bill 375, the Sustainable Communities and Climate Protection Act

Senate Bill 375, the Sustainable Communities and Climate Protection Act, passed in 2008, requires CARB to develop and set regional targets for greenhouse gas (GHG) emission reductions from passenger vehicles. Metropolitan planning organizations (MPOs) must prepare a Sustainable Communities Strategy (SCS) that will reduce GHG emissions to achieve these regional targets, if feasible to do so. The SCS is a component to the Regional Transportation Plan (RTP), which regulates transportation financing in each region. The RTP and SCS must complement each other and accommodate the Regional Housing Needs Allocation (RHNA). The bill modified the RHNA requirements to align with production of the RTP/SCS. The purpose of this coordination is for each MPO to arrive at a mix of transportation and land use strategies that will direct the region's growth in such a way that vehicle miles travelled (VMT) will be reduced, thus reducing emissions from car trips which are the largest source of emissions.

The Southern California Association of Governments (SCAG) is the MPO for the County of Los Angeles (along with the Counties of Imperial, San Bernardino, Riverside, Orange, and Ventura). The 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020-2045 RTP/SCS aka Connect SoCal) is the most recent RTP/SC adopted by SCAG. The 2020-2045 RTP/SCS is a long-range visioning plan that examines existing land use and transportation conditions throughout the SCAG region and forecasts how the plan will meet the region's transportation needs between 2020 and 2045, as well as achieve CARB's GHG emissions reduction targets. The 2020-2045 RTP/SCS was adopted on September 3, 2020 by SCAG's Regional Council, and on October 30, 2020, CARB officially determined that the 2020-2045 RTP/SCS would achieve CARB's 2035 GHG emission reduction target of 19 percent below 2005 per capita emissions levels.

Senate Bill X1-2

Established in 2002 under SB 1078 and accelerated in 2006 under SB 107 and again in 2011 under SB X1-2, California's Renewable Portfolio Standards (RPS) requires retail sellers of electric services to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020. The 33 percent standard is consistent with the RPS goal established in the Scoping Plan. These mandates apply directly to investor-owned utilities. Based on the investor-owned utilities (IOU) Annual RPS Compliance Filings in August 2017, the three largest IOUs in the state surpassed this requirement.[8]

Title 24 Building Energy Efficiency Standards

Title 24 is also known as the Building Standards Code and contains 12 parts, including Part 6 which is known as the Building Energy Efficiency Standards or Energy Code. The Standards contain energy and water efficiency

[8] California Public Utilities Commission, 2017 Annual Report: Renewable Portfolio Standard, November 2017 (at Table 1).

requirements for newly constructed buildings, additions to existing buildings, and alterations to existing buildings.

The On August 11, 2021, the CEC adopted the 2022 Energy Code. In December of 2022 it was approved by the California Building Standards Commission for inclusion into the California Building Standards Code. The 2022 Energy Code establishes electric-ready requirements for new homes, expands solar PV and battery storage standards, strengthens ventilation standards, and more. Buildings whose permit applications are applied for on or after January 1, 2023, must comply with the 2022 Energy Code. Compliance with the standards is confirmed by the local agency during the plan check process prior to permitting.

California Green Building Standards Code

The California Green Building Standards Code is Part 11 of the Building Standards Code, Title 24, commonly referred to as the California Green Building Code (CALGreen). The 2022 CALGreen Code took effect on January 1, 2023 and includes both voluntary and mandatory energy efficiency standards for commercial and residential buildings. The 2022 code differs from the 2019 code by offering new voluntary prerequisites such as battery storage system controls and heat pump space, and water heating, to encourage building electrification. The voluntary provisions of the CALGreen Code generally forecast provisions that are likely to become mandatory as part of the next updated Energy Code, which will take effect in 2025. As part of Title 24, applicable CALGreen Code requirements are enforced through the building permit process.

Local

The Project is exempt from local land use regulations and as such is subject to applicable state and regional regulations in this regard. The provisions of AB 32, SB 32, and SB 375 are implemented at the regional level through the SCAG 2020-2045 RTP/SCS, which is the applicable plan to the region for the reduction of GHGs.

Existing Conditions

Air Quality/Greenhouse Gasses

Meteorological Setting

The Project is located within the South Coast Air Basin which is bounded by the Pacific Ocean to the west, the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east, and San Diego County to the south.

In addition to being a metropolitan area with a high level of human activity, the topography and climate of Southern California combine to produce unhealthful air quality in the Air Basin. Low temperature inversions, light winds, shallow vertical mixing, and extensive sunlight, in combination with topographical features such as adjacent mountain ranges that hinder dispersion of air pollutants, can result in degraded air quality within the Air Basin.

Existing Ambient Air Quality

Existing levels of ambient air quality and historical trends and projections in the proposed project area are documented from measurements made by the South Coast Air Quality Management District (SCAQMD), which is the agency that is responsible for regulating stationary sources of emissions in the air basin. The project

site is nearest to the West San Fernando Valley monitoring station (AQS ID 060371201), therefore, monitoring data recorded at Station 060371201 for regional air pollutants, such as O3, carbon monoxide (CO), nitrogen oxides (NOx), and 10-micron diameter or less particulate matter (PM-10 and PM-2.5) are used to represent the air quality in the proposed project area. **Table 2, Project Area Air Quality Monitoring Summary** provides data from this monitoring station for the previous five years (2018-2022) for which this data is available from the SCAQMD website.[9]

Table 2
Project Area Air Quality Monitoring Summary

Pollutant/Standard	2018	2019	2020	2021	2022
Ozone (O_3)					
Number of Days Standards Exceeded					
1-Hour > 0.09 ppm (S)	14	1	14	4	7
8-Hour > 0.07 ppm (S)[1]	49	6	49	33	24
Maximum Observed Concentration					
Max. 1-Hour Conc. (ppm)	0.120	0.101	0.142	0.110	0.110
Max. 8-Hour Conc. (ppm)	0.101	0.087	0.115	0.083	0.096
Carbon Monoxide (CO)					
Number of Days Standards Exceeded					
8-Hour > 9.0 ppm (S, F)	0	0	0	0	0
Maximum Observed Concentration					
Max 8-Hour Conc. (ppm)	2.1	2.2	1.7	1.9	1.8
Nitrogen Dioxide (NO_2)					
Number of Days Standards Exceeded					
1-Hour > 0.18 ppm (S)	0	0	0	0	0
Maximum Observed Concentration					
Max. 1-Hour Conc. (ppm)	0.057	0.064	0.054	0.077	0.054
Inhalable Particulates (PM-10)[2]					
Number of Days Standards Exceeded/Days Monitored					
24-Hour > 50 μg/m³ (S)	31/363	3/9	24/337	3/60	4/360
24-Hour > 150 μg/m³ (F)	0/363	0/9	0/337	0/60	0/360
Maximum Observed Concentration					
Max. 24-Hr. Conc. (μg/m³)	81	62	77	64	60

24-Hour > 35 μg/m³ (F)	0/106	0/118	0/116	3/120	0/121
Maximum Observed Concentration					
Max. 24-Hr. Conc. (μg/m³)	31.0	30.0	27.6	55.5	20.5

Source: SCAQMD, Historical Data by Year, Air Quality Data Tables downloaded from: https://www.aqmd.gov/home/air-quality/historical-air-quality-data/historical-data-by-year.
[1] Federal standard of 0.075 is not reported as state 0.07 is more stringent.
[2] Data taken from the Central LA (downtown) monitoring station as the West San Fernando Valley station does not record PM-10 data.

As shown in Table 2, O_3 levels within the valley occasionally exceed both the 1-hour and 8-hour standards on a yearly basis, which is common throughout the County, and PM levels will also exceed standards, which reflects the pollutants for which the basin is in non-attainment.

[9] South Coast Air Quality Management District, Historical Data by Year, 2018-2016 Air Quality Data Tables.

Greenhouse Gases

Section 38505(g) of the California Health and Safety Code defines GHGs to include the following compounds: carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3). Two important ways in which these gases differ from each other are their ability to absorb energy (their "radiative efficiency"), and how long they stay in the atmosphere (also known as their "lifetime"). The ability of equivalent masses of each GHG to trap heat in the atmosphere is measured by its global warming potential (GWP).[10] CO_2 is the reference gas used for GWP, and it has a GWP of one. The GWP of other GHGs are determined based on their heat trapping potential relative to CO_2. Because of this, GHG emissions are commonly expressed in terms of carbon dioxide equivalents (CO_2e), where CO_2e is calculated by the quantity of each GHG multiplied by its associated GWP factor. Below is a description of each GHG emission as described by the California Climate Action Registry (CCAR) General Reporting Protocol.[11]

- Carbon Dioxide (CO_2): Consisting of a single carbon and two oxygen atoms, CO_2 is the most common of the six primary GHG emissions, and it provides the reference point for the GWP of other gases. Thus, the GWP of CO_2 is equal to one.

- Nitrous Oxide (N_2O): Consisting of two nitrogen atoms and a single oxygen atom, N_2O possesses a GWP of 310 and is typically generated as a result of soil cultivation practices, particularly the use of commercial and organic fertilizers, fossil fuel combustion, nitric acid production, and biomass burning.

- Methane (CH4): Consisting of a single carbon atom and four hydrogen atoms, CH_4 possesses a GWP of 21 and is produced through the anaerobic decomposition of waste in landfills, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

- Hydrofluorocarbons (HFCs): Primarily used as refrigerants, HFCs consist of a class of gases containing hydrogen, fluorine, and carbon. They possess a range of high and very high GWP values from 120 to 12,000.

- Perfluorocarbons (PFCs): PFCs consist of a class of gases containing carbon and fluorine and are originally introduced as alternatives to ozone depleting substances. They are typically emitted as by-products of industrial and manufacturing processes and possess GWPs ranging from 5,700 to 11,900.

- Sulfur Hexafluoride (SF_6): SF_6 consists of a single sulfur atom and six fluoride atoms, possessing a very high GWP of 23,900. SF_6 is primarily used in electrical transmission and distribution systems.

According to the CARB *California Greenhouse Gas Emissions for 2000 to 2020 Trends of Emissions and Other Indicators*, "In 2020, emissions from GHG emitting activities statewide were 369.2 MMT CO_2e, 35.3 MMT CO_2e lower than 2019 levels and 61.8 MMT CO_2e below the 2020 GHG Limit of 431 MMT CO_2e. The 2019 to 2020 decrease in emissions is likely due in large part to the impacts of the COVID-19 pandemic. Economic recovery from the pandemic may result in emissions increases over the next few years. As such, the total 2020 reported

10 U.S. Environmental Protection Agency, Greenhouse Gas Emissions Understanding Global Warming Potentials, Accessed on September 17, 2023 at: https://www.epa.gov/ghgemissions/understanding-global-warming-potentials.

11 California Climate Action Registry, General Reporting Protocol Version 3.1, January 2009.

emissions are likely an anomaly, and any near-term increases in annual emissions should be considered in the context of the pandemic."[12]

Per capita GHG emissions in California have dropped from a 2001 peak of 13.8 metric tons per person to 9.3 metric tons per person in 2020, a 33 percent decrease. Overall trends in the inventory also continue to demonstrate that the carbon intensity of California's economy (the amount of carbon pollution per million dollars of gross domestic product (GDP)) is declining. From 2000 to 2020, the carbon intensity of California's economy decreased by 49 percent while the GDP increased by 56 percent. Likely in part due to the COVID-19 pandemic, GDP fell 2.8 percent in 2020 while the emissions per GDP declined by 6.1 percent compared to 2019.[13]

2. CalEEMod Detailed Reports for Phase I and Phase II Construction Emissions Modeling

Notes on models:

Phase 1 demo debris was calculated in the following manner:

CalEEMod calculated the demolition of 34,896 square-feet of structures (all structures except for the portables that will continue to be used and the restroom building on the eastern boundary of the site) would require 15 one-way haul trips a day, which equals 7.5 laden and 7.5 unladen trips, for 27 days (duration of demo phase). The default truck in CalEEMod holds 20 tons of material, therefore 34,896 sf = 4,050 tons. The Preliminary Geotechnical Evaluation reports that where borings occurred in pavement covered areas the pavement was 2.5 to 3.5 inches thick in pedestrian areas, and 5 to 8.5 inches thick in traffic areas. To estimate pavement debris the promenade is calculated as 29,938 square-feet in area with 7 inch pavement, and the area around the campus buildings at 37,430 square-feet (not including promenade or the quads) with 3 inch pavement. This amounts to 1,281 tons and 687 tons of debris, respectively (at 3,960 pounds per cubic yard of asphalt). Total debris to be removed during demolition therefore is 6,018 tons of debris. The Phase II ESA determined an estimated 273 cubic yards of soil on site is contaminated and must be removed. As that soil must be replaced it is certain that 273 cubic yards of soil must be exported and another 273 cubic yards of soil imported. Although it appears fill replacement should result in minimal additional soil import/export, a conservative total figure of 400 cubic yards was chosen for the emissions model and applied to both phases to account for the potential of all import/export occurring during one grading phase.

Phase 2 demo debris was calculated in the following manner:

The portables to be demo'd plus easternmost restrooms = 8,215 sf of structures. CalEEmod calculates this at 4 trips a day (2 laden trips) for 23 days. Each trip is 20 tons, to the total is 920 tons. Asphalt in Phase 2 areas is assumed to stay on site and be used as base for new asphalt except where it must be removed according to the ESA. Total removal equals 17,540sf of asphalt. Assuming 3 inch thickness asphalt amounts to162cy of material. At 3,960 lbs per cubic yard this equals 321 tons. With the addition of the structures this equals 1,241 tons of material to be removed. 400 cy of import/export of soil was added as described above..

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit

Temperature and Extreme Heat	19.4	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	82.5
AQ-PM	63.3
AQ-DPM	64.4
Drinking Water	83.1
Lead Risk Housing	50.5

Pesticides	0.00
Toxic Releases	52.2
Traffic	60.8
Effect Indicators	—
CleanUp Sites	27.5
Groundwater	71.1
Haz Waste Facilities/Generators	58.3
Impaired Water Bodies	43.8
Solid Waste	43.9
Sensitive Population	—
Asthma	88.2
Cardio-vascular	82.4
Low Birth Weights	73.8
Socioeconomic Factor Indicators	—
Education	85.5
Housing	78.1
Linguistic	92.5
Poverty	86.5
Unemployment	22.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	21.39099192
Employed	80.73912486
Median HI	18.96573848

Education	—
Bachelor's or higher	26.78044399

2016 Voting	17.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	91.0
Healthy Places Index Score for Project Location (b)	26.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	High school land use includes work west of the promenade, including the promenade, but excluding resurfacing of parking lot and athletic area in NW corner. Hunter student union bldg at 50k sf. Landcaping is estimate at 40% of development area (minus building footprint): Both of the quads are in the work area and will be majority landscape, other areas are intended to be 20-30% landscaped. Lot acreage reflects the development zone areas on the west site excluding a small area around the boiler room and the promenade (exclusion of boiler room won't effect estimates as there will be no earth moving activities there. Parking represents flat work for the promenade. No landscaping is included as that is captured in the high school use.
Construction: Construction Phases	Per Page 64 of criteria docs demo plus "rough grading" phase (the only grading phase in the docs) is 4 months. Per page 66 construction is 48 months. "Construction" includes CalEEMod construction, paving, and coating phases. The phases in the criteria docs are long because it is unknown at this time exactly how different components of the project will be phased. In order to create a more realistic timeframe for emissions calculations the project has been broken into two phases. Phase 1- represented here- includes all of the work west of the promenade, including the promenade, but excluding the resurfacing of parking and athletic areas as they will be used during construction of the new student union building. Demo and grading are reduced to 2.5 months total. Construction is 1 year. Paving normally occurs after construction in the model but the promenade will likely be completed asap as it is the primary fire lane. Painting includes all buildings west of the promenade and as such is extended as phasing may have the student union building painted first and other buildings painted once that is occupied.
Construction: Architectural Coatings	All existing, remaining buildings will receive exterior paint. Total of 240,747sf of existing buildings, per CalEEMod's formula exterior point sf is 25% of that figure: 60,187 sf. This was added to 25,000 sf calculated by CalEEMod for new buildings.
Construction: Paving	Development area minus building footprint is 94,065. Landscaping was calculated at 40% of that figure, hardscaping is therefore 60%- 1.3 acres. Promenade is estimated to be 20% asphalt, though there may be none.
Construction: Off-Road Equipment	LAUSD standard condition SC-AQ 4 states that tier 4 equipment will be specified for the project.

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	10,890	3,630	9,670

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (Ton of Debris)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	1,241	—
Grading	400	400	15.0	0.00	—
Paving	0.00	0.00	0.00	0.00	3.70

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction

Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
City Park	0.00	0%
Other Asphalt Surfaces	3.70	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	0.00	690	0.05	0.01
2028	0.00	690	0.05	0.01

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	19.4	annual days of extreme heat
Extreme Precipitation	5.70	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A

Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	2	1	1	3
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	82.5
AQ-PM	63.3
AQ-DPM	64.4
Drinking Water	83.1
Lead Risk Housing	50.5
Pesticides	0.00
Toxic Releases	52.2
Traffic	60.8
Effect Indicators	—
CleanUp Sites	27.5
Groundwater	71.1
Haz Waste Facilities/Generators	58.3
Impaired Water Bodies	43.8
Solid Waste	43.9
Sensitive Population	—
Asthma	88.2
Cardio-vascular	82.4
Low Birth Weights	73.8
Socioeconomic Factor Indicators	—
Education	85.5
Housing	78.1

Linguistic	92.5
Poverty	86.5
Unemployment	22.6

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	21.39099192
Employed	80.73912486
Median HI	18.96573848
Education	—
Bachelor's or higher	26.78044399
High school enrollment	100
Preschool enrollment	41.10098807
Transportation	—
Auto Access	10.67624791
Active commuting	90.01668164
Social	—
2-parent households	24.53483896
Voting	13.93558322

2016 Voting	17.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	91.0
Healthy Places Index Score for Project Location (b)	26.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Land Use	Work area includes everything east of the promenade and the parking and athletic field to be resurfaced in the NW area of the campus. City park used for athletic field and surrounding, size is that area minus the area on the east side that will be paved. Landscape area is total area minus the track, bleachers, and building footprints. All of landscaping conservatively considered special landscaping (entered as -1 less square-feet in order to enable this note). Recreational building is the total of the two buildings in the work area (7,260). Parking other asphalt surface captures the running track, paved area east of the track, and the parking and play areas in the NW area of the campus.
Construction: Construction Phases	Default kept for construction and coating. Demo and grading reduced to 1.5 months (to keep in 4 mo total from criteria docs including phase 1). Paving increased 10 days from default.
Construction: Off-Road Equipment	Standard conditions of approval stipulate Tier 4 equipment.

3. Development Area Breakdowns for CalEEMod Modeling

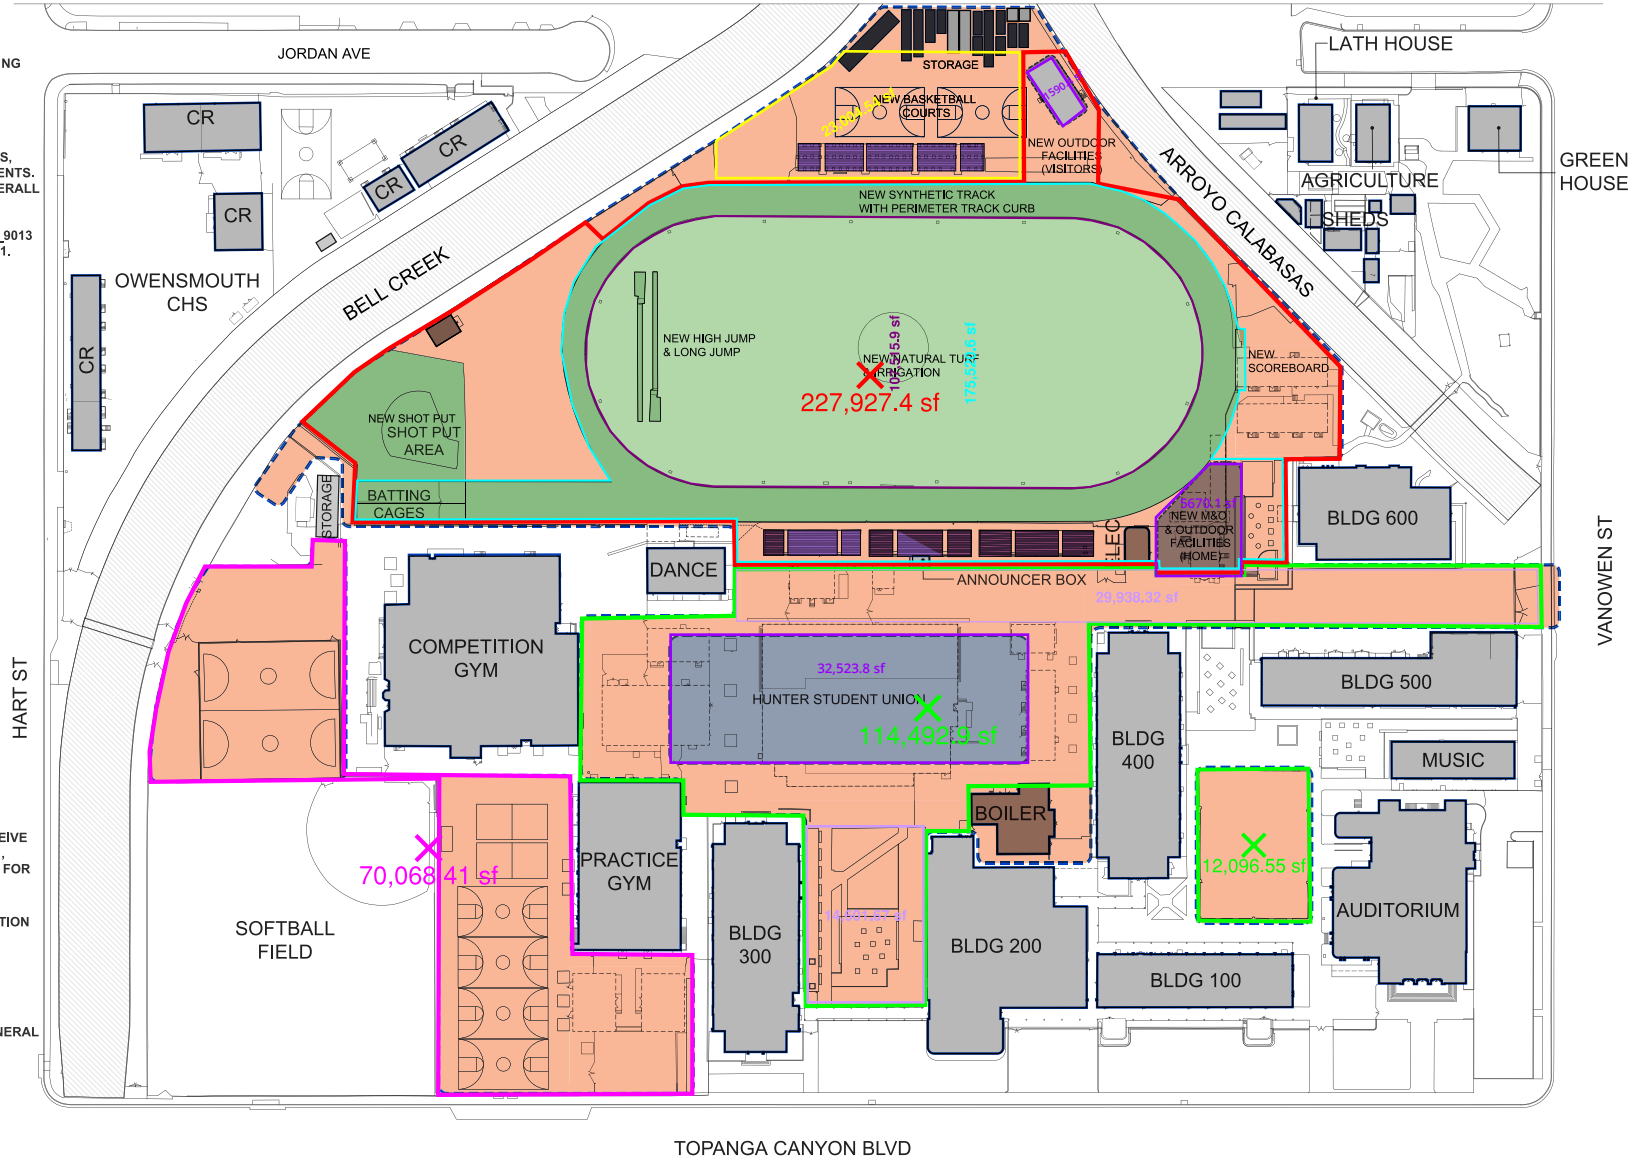
III. Development Area Breakdowns for CalEEMod Modeling

GENERAL NOTES

1. REPAINT ALL REMAINING BUILDINGS AND STRUCTURES ON CAMPUS, INCLUDING BUT NOT LIMITED PLASTER, CONCRETE, METAL, SCREENS, RAILINGS, SOFFITS, FIXTURE, ACCESSORIES, ROOFING, WOOD TRIM AND FASCIAS, LOCKERS, DOORS, DOOR FRAMES, GUTTERS, AND DOWNSPOUTS, ARCADES, COLUMNS, CANOPIES, AND OTHER BUILDING ELEMENTS. COLORS TO BE COORDINATED WITH OVERALL CAMPUS COLOR SCHEMES. EXTERIOR SURFACES SHOULD BE PREPARED AND TREATED PER LAUSD SPEC SECTION 09_9013 PAINTING OF EXISTING_FACILITIES_20211.

2. PROTECT SPECIALTY SIGNS, MURALS AND EXPOSED FACE BRICK DURING BUILDING ENHANCEMENTS.

3. REPLACE ALL ROTTEN WOOD FLOOR BOARDS & SEATS AND MATCH EXISTING COLOR AND FINISH FOR ALL EXISTING BLEACHERS.



4. MODIFY EXISTING BLEACHERS FOR ADA SEATING AND ADA COMPLIANT HAND & GUARD RAILS.

5. CLEAN THE RUST OFF THE EXISTING BLEACHERS.

6. REPAINT THE ANNOUNCER'S BOOTH

Re: Canoga Park High School, 6850 Topanga Canyon Blvd., Los Angeles, California 91303
City of Los Angeles Tree Inventory Report

Dear Mr. Kim,

This report addresses our office's site visits on June 13 and June 14, 2022, to Canoga Park High School located at 6850 Topanga Canyon Boulevard in the Canoga Park area of Los Angeles, California. Carlberg Associates was retained to visit the property, inventory all qualifying campus trees, and prepare a photo-documented tree report in accordance with the Los Angeles Unified School District's (LAUSD) report requirements. Trees and shrubs considered protected by the City of Los Angeles' Tree Preservation Ordinance No. 186,873 (Chapter IV, Article 6 of the Los Angeles Municipal Code) are coast live oak, western sycamore, Southern California black walnut, California bay laurel, Mexican elderberry and toyon trunk diameters (measured at 4.5 feet above grade) of 4 inches or greater. They, along with non-protected trees with trunk diameters of four inches and greater comprise the tree inventory.

The table on the following pages sets forth the data for the two hundred and sixty-six (266) inventoried trees: two hundred and sixty-four (264) are on the campus proper, and there are two (2) trees on neighboring private properties whose canopies overhang the project site. ***Twenty-six (26) trees are considered protected by the City of Los Angeles' Tree Preservation Ordinance No. 186,873.*** By virtue of their trunk diameter size of eight inches and greater, 211 private property trees are considered 'significant' as defined by the City's Planning Division.

PROJECT RECOMMENDATIONS

In my professional opinion, the project can proceed if the following conditions are met:

- Missing tree tags need to be replaced prior to demolition or commencement of any other site work.
- Any demolition, digging, excavating, or trenching within the protected zone of any protected tree to remain shall be monitored by a qualified arborist.
- The arborist report is part of the set of plans given to the contractor. The contractor should be familiar with the specific instructions and responsibilities pertaining to protected trees. It is recommended the District's arborist (or designee) meet with the contractor prior to commencement of construction on the project.
- Exposed roots to remain should be covered with wet burlap, carpet remnants or other material that may be kept moist until soil can be replaced.
- Any pruning, including dead wooding, should be performed in compliance with the latest ANSI pruning standards by an ISA certified arborist (or ISA certified tree worker).
- Tree pruning, and removals should occur outside of nesting bird season. If pruning and / or removals must occur during nesting bird season, all precautions related to State and Federal laws that protect nesting birds shall be adhered to.
- Hand-held equipment should be used for trenching for foundations, irrigation, and utility placement to avoid shattering and tearing roots. If feasible, substantial roots (those greater than 2 inches in diameter) shall be bridged or tunneled-under to avoid impacts to the root system.
- Equipment, materials, and vehicles shall not be stored, parked, or operated within the protected zone of the protected trees to remain.
- Equipment with overhead exhaust shall avoid the remaining trees to the extent feasible and shall not be placed in such a manner as to scorch overhanging branches or foliage of the remaining protected trees. Smaller equipment shall be used in such areas as deemed necessary by the District's arborist (or designee).
- Five (5) foot high chain link fencing shall be installed around remaining trees within the areas of potential impact. Trees to remain should be fenced to the limits of their driplines or to the maximum limits that existing hardscape to remain allows.
- A 'Warning' sign is prominently displayed on each protective enclosure. The sign will be a minimum of 8.5 inches x 11 inches and clearly state the following:

TREE PROTECTION ZONE THIS FENCE SHALL NOT BE REMOVED Project Arborist: Carlberg Associates 310.451.4804 or 626.428.5072

Please feel welcome to contact me at our Santa Monica office if you have any immediate questions or concerns.

Respectfully submitted,

Cy Carlberg, Registered Consulting Arborist
Principal, Carlberg Associates

194	mulberry	*Morus alba*	18	24	23/13/15/13	B+	B-	Significant	MPE, decay in upper canopy, EG
195	mulberry	*Morus alba*	12, 13, 13	25	18/15/20/25	A	B	Significant	diameters estimated due to no access, MPE, EG
196	camphor	*Cinnamomum camphora*	2.1, 2.3, 3	18	8/5/5/10	A-	B	No	growing against fence, SS, volunteers
197	Chinese elm	*Ulmus parvifolia*	2.3, 3.7, 2.6, 2.6	18	12/15/15/15	A-	B	Significant	growing against fence, SS, volunteers
198	California pepper	*Schinus molle*	9.4	18	8/11/18/16	B	B-	Significant	trunk leans south, embedded tie marks on trunk, mechanical damage
199	California pepper	*Schinus molle*	8.9	18	6/20/23/15	B	C+	Significant	trunk leans heavy south, mechanical damage, stakes present and need correcting
200	American sweetgum	*Liquidambar styraciflua*	17.9	20	8/8/10/8	C-	C-	Significant	topped, all EG, extensive dieback
201	Mexican fan palm	*Washingtonia robusta*	12, 16 (BT-5, 15')	20	8/8/8/8	A-	B+	Significant	some dead fronds

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	Protected or Significant Tree	Comments
202	tree of heaven	*Ailanthus altissima*	5.6	20	7/7/7/7	B	B+	No	partially shaded out
203	citrus	*Citrus sp.*	2.8, 2.9, 1.7, 1.8	15	8/10/8/8	B	B	Significant	codoms at base, a bit sparse
204	Chinaberry	*Melia azedarach*	13.4, 15	22	22/18/25/20	A	B+	Significant	growing against fence, MPE, SS, EG
205	Victorian box	*Pittosporum undulatum*	12.3	20	8/10/10/8	C-	D	Significant	trunk decayed, extensive dieback, deadwood throughout, EG, MPE, HOB
206	American sweetgum	*Liquidambar styraciflua*	19	20	10/17/14/14	C-	C-	Significant	topped, extensive dieback, EG, codoms at 7 feet
207	xylosma	*Xylosma congesta*	15.8	25	14/20/17/13	B	B-	Significant	moderate dieback, trunk leans against fence, MPE
208	shamel ash	*Fraxinus uhdei*	6.6, 10.6, 11.2, 11.1, 6	28	18/20/18/22	B	B	Significant	6-inch trunk embedded in fence, interior dieback, codoms at base
209	Indian laurel fig	*Ficus microcarpa*	5.4	20	17/14/0/0	B+	B-	No	trunk leans northeast against fence, mechanical damage
210	Modesto ash	*Fraxinus velutina 'Modesto'*	25.3	30	22/23/20/25	B-	B-	Significant	HOB, moderate dieback, some exposed roots
211	evergreen pear	*Pyrus kawakamii*	6	18	3/11/20/18	B-	B-	No	shaded out, HOB, mechanical damage on trunk

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	Protected or Significant Tree	Comments
212	coast redwood	*Sequoia sempervirens*	26.8	50	13/15/12/13	B	B	Significant	spiked, MPE, some dieback and browning
213	carrotwood	*Cupaniopsis anacardioides*	4.2	18	10/10/10/10	A	B+	No	
214	coast redwood	*Sequoia sempervirens*	19.2	40	6/6/10/10	C	C	Significant	moderate browning throughout, SS, EG, top dieback
215	tree of heaven	*Ailanthus altissima*	9.2, 10, 9	28	13/13/20/24	A-	B+	Significant	growing against fence
216	Indian laurel fig	*Ficus microcarpa*	7, 3.9, 3.9, 7, 7.5, 6, 4	25	16/16/15/13	B+	B	Significant	covered in ants, codoms at base, minor interior dieback
217	tree of heaven	*Ailanthus altissima*	22	25	20/15/17/18	B+	B	Significant	diameter measured low
218	coast redwood	*Sequoia sempervirens*	20	35	N/A	F	F	Significant	tree standing dead
219	lemon bottlebrush	*Callistemon citrinus*	5.7, 6.5, 5.4	22	4/6/10/8	B-	B-	Significant	5.4 inch trunk is standing dead, one trunk cut, moderate dieback
220	shamel ash	*Fraxinus uhdei*	12, 13, 13	35	15/23/26/25	B+	B	Significant	MPE, minor dieback, HOB
221	tree of heaven	*Ailanthus altissima*	28	40	24/28/24/17	B	C+	Significant	fence and pole embedded into trunk, some upper canopy dieback, mechanical damage on trunk
222	tree of heaven	*Ailanthus altissima*	6.7	20	16/12/18/14	B	B	No	partially shaded out, fence embedded into lower trunk

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	Protected or Significant Tree	Comments
223	mulberry	*Morus alba*	24.2, 3.9	25	18/20/20/14	C	D	Significant	topped, decay from base to topping cuts, all EG
OS224	tree of heaven	*Ailanthus altissima*	6	28	6/6/15/13	A	B+	No	overhangs approx 13 feet to west
OS225	tree of heaven	*Ailanthus altissima*	7	28	10/10/15/18	A	B	No	overhangs approx 18 feet to west
226	Mexican fan palm	*Washingtonia robusta*	12 (BT-60')	65	8/8/8/8	A-	B+	Significant	some dead fronds
227	tree of heaven	*Ailanthus altissima*	3.8, 4.5, 7.8	25	10/5/17/20	A	B+	Significant	codoms at 3 feet, growing into adjacent fence
228	coast live oak	*Quercus agrifolia*	7.3, 10.8, 19.6	28	30/12/23/22	A	B	Protected	against fence, fence embedded into parts of trunk, HOB, MPE, overhangs LA River easement, SS, EG, partially shaded out by adjacent sycamore
229	Western sycamore	*Platanus racemosa*	21.8	40	28/28/25/26	A-	B+	Protected	MPE, EG, minor interior dieback
230	Western sycamore	*Platanus racemosa*	23.4	40	26/23/28/20	A-	B-	Protected	MPE, EG, minor interior dieback, COD, cavity at base
231	coast redwood	*Sequoia sempervirens*	9	22	12/8/10/8	B+	B	Significant	pole embedded at base, minor browning throughout

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	Protected or Significant Tree	Comments
232	Mexican fan palm	*Washingtonia robusta*	14 (BT-12')	20	8/8/8/8	A-	B	Significant	some dead fronds, growing adjacent to fence, overhangs LA River easement
233	apple	*Malus sp.*	8.5	18	4/8/8/11	B	B	Significant	base of trunk directly adjacent to fan palm, partially shaded out
234	tree of heaven	*Ailanthus altissima*	3.4, 5.1, 6	22	10/10/13/8	A-	B	Significant	growing against fence, fence embedded to parts of trunk
235	apple	*Malus sp.*	7.2	18	6/4/8/8	B+	B-	No	small tree growing at base not included, one large codom trunk cut at 4 feet
236	pear	*Pyrus sp.*	3, 5.8, 2.7	16	12/6/10/6	B+	B	Significant	mechanical damage
237	California pepper	*Schinus molle*	54.5	45	45/35/30/28	B	B	Significant	large cavity on lower trunk, exudation, SS, EG, MPE, HOB, overhangs LA River easement
238	coast live oak	*Quercus agrifolia*	3.2, 3.3	12	7/9/10/11	B	B	Protected	shaded out, EG

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	Protected or Significant Tree	Comments
239	coast live oak	*Quercus agrifolia*	18.2	20	18/20/14/28	A-	B-	Protected	possible GR, growing into canopy of adjacent liquidambar, pruned for under canopy clearance, MPE, EG, partially shaded out
240	Norfolk Island pine	*Araucaria heterophylla*	6.6	16	5/4/8/16	B-	B-	No	decay at base, leans west, shaded out
241	Italian stone pine	*Pinus pinea*	31.4	30	10/28/40/30	B	B	Significant	MPE, HOB, a bit unbalanced to the south
242	Italian stone pine	*Pinus pinea*	7.2	15	5/5/12/8	B-	C-	No	shaded out, EG, growing into limb of adjacent pine
243	Mexican fan palm	*Washingtonia robusta*	12 (BT-50')	55	7/7/7/7	A-	B+	Significant	some dead fronds
244	Mexican fan palm	*Washingtonia robusta*	14 (BT-10')	16	6/6/6/6	A	B+	Significant	some dead fronds
245	American sweetgum	*Liquidambar styraciflua*	14.4	30	N/A	F	F	Significant	tree standing dead
246	American sweetgum	*Liquidambar styraciflua*	21.1	30	7/7/10/10	B-	B-	Significant	EG, topped, MPE
247	American sweetgum	*Liquidambar styraciflua*	22.8	30	10/10/12/18	B-	B-	Significant	EG, topped, MPE
248	American sweetgum	*Liquidambar styraciflua*	15.8	35	12/12/12/14	B	B-	Significant	EG, topped, MPE

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	Protected or Significant Tree	Comments
249	American sweetgum	*Liquidambar styraciflua*	14.5	28	7/10/12/15	B-	B-	Significant	EG, topped, MPE
250	American sweetgum	*Liquidambar styraciflua*	15.9	25	10/5/8/12	B-	B-	Significant	EG, topped, MPE, top dieback
251	American sweetgum	*Liquidambar styraciflua*	20.1	30	12/14/13/12	B-	B-	Significant	EG, topped, MPE
252	American sweetgum	*Liquidambar styraciflua*	13.7	28	12/6/6/12	B	B-	Significant	EG, topped, MPE
253	coast live oak	*Quercus agrifolia*	3.2, 3.2	15	8/10/8/10	A-	B	Protected	growing through fence, squirrel damage
254	American sweetgum	*Liquidambar styraciflua*	22.2	35	18/16/15/15	B	B-	Significant	EG, MPE
255	American sweetgum	*Liquidambar styraciflua*	17.3	28	6/11/10/13	B-	B-	Significant	EG, topped, MPE
256	American sweetgum	*Liquidambar styraciflua*	18.8	20	10/10/11/12	B	D	Significant	EG, topped, MPE, COD, large cavity
257	American sweetgum	*Liquidambar styraciflua*	26.6	40	18/14/16/14	D	D	Significant	EG, MPE
258	American sweetgum	*Liquidambar styraciflua*	20	18	10/10/7/7	B-	B-	Significant	EG, topped, MPE, very sparse
259	American sweetgum	*Liquidambar styraciflua*	17.3	18	N/A	F	F	Significant	tree standing dead
260	American sweetgum	*Liquidambar styraciflua*	21	35	17/14/12/13	B	B-	Significant	EG, topped, MPE

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (DBH)* in inches	Height (feet)	Canopy Spread (N/E/S/W) in feet	Health	Structure	Protected or Significant Tree	Comments
261	American sweetgum	*Liquidambar styraciflua*	20.7	40	12/14/13/10	B-	B-	Significant	EG, topped, MPE
262	American sweetgum	*Liquidambar styraciflua*	18.9	35	16/16/16/13	B	B-	Significant	EG, MPE
263	American sweetgum	*Liquidambar styraciflua*	21.7	40	16/16/17/12	B-	B-	Significant	EG, topped, MPE
264	American sweetgum	*Liquidambar styraciflua*	18.2	35	12/10/16/17	B-	B-	Significant	EG, MPE
265	American sweetgum	*Liquidambar styraciflua*	21.1	28	16/16/17/15	B-	B-	Significant	EG, topped, MPE
266	American sweetgum	*Liquidambar styraciflua*	21.8	40	15/16/12/13	B+	B-	Significant	EG, MPE

DBH – Diameter at breast height. A forestry term used to describe a tree's trunk diameter measured at 4.5 feet above grade. Often used as a representation of tree size.

BT – Brown trunk (height) - Since palm trunks do not generally increase in diameter with age, they are described by their brown trunk height (the distance between grade and the newest emerging spear).

HOB – History of breakage

MPE – Multiple pruning events

GR – Girdled root

COD – Column of decay

SS – Stump sprout

EG – Epicormic growth

EXHIBIT A – AERIAL IMAGE OF SUBJECT PROPERTY

HEALTH AND STRUCTURE GRADE DEFINITIONS

Health and structure ratings of the trees are based on the archetype tree of the same species through a subjective evaluation of its physiological health, aesthetic quality, and structural integrity.

Overall physiological condition (health) and structural condition were rated A-F:

Health

A. Outstanding – Exceptional trees of good growth form and vigor for their age class; exhibiting very good to excellent health as evidenced by normal to exceptional shoot growth during current season, good bud development and leaf color, lack of leaf, twig or branch dieback throughout the crown, and the absence of decay, bleeding, or cankers. Common leaf and/or twig pests may be noted at very minor levels.

B. Above average – Good to very good trees that exhibit minor necrotic or physiological symptoms of stress and/or disease; shoot growth is less than reasonably expected, leaf color is less than optimal in some areas, the crown may be thinning, minor levels of leaf, twig, and branch dieback may be present, and minor areas of decay, bleeding, or cankers may be manifesting. Minor amounts of epicormic growth may be present. Minor amounts of fire damage or mechanical damage may be present. Still healthy, but with moderately diminished vigor and vitality. No significant decline noted.

C. Average – Average, moderately good trees whose growth habit and physiological or fire-induced symptoms indicate an equal chance to either decline or continue with good health into the near future. Most of these trees exhibit moderate to significant small deadwood in outer crown areas, decreased shoot growth and diminished leaf color and mass. Some stem and branch dieback is usually present and epicormic growth may be moderate to extensive. Cavities, pockets of decay, relatively significant fire damage, bark exfoliation, or cracks may be present. Moderate to significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it is expected to negatively impact the lifespan of the tree. Tree may be in early decline.

D. Below Average/Poor - trees whose growth habit and physiological or fire-induced symptoms indicate significant, irreversible decline. Most of these trees exhibit significant dieback of wood in the crown, possibly accompanied by significant epicormic sprouting. Shoot growth and leaf color and mass is either significantly diminished or nonexistent throughout the crown. Cavities, pockets of decay, significant fire damage, bark exfoliation, and/or cracks may be present. Significant amounts of insect or disease symptoms may be present; the tree may be shaded or crowded in such a way that it has negatively impacted the lifespan of the tree. Tree appears to be in irreversible decline.

F. Dead or in spiral of decline – this tree exhibits very little to no signs of life.

Structure

A. Outstanding – Trees with outstanding structure for their species exhibit trunk and branch arrangement and orientation that result in a sturdy form or architecture that resists failure under normal circumstances. The spacing, orientation, and size of the branches relative to the trunk are quintessential for the species and free from defects. No outward sign of decay or pathological disease is present. Some trees exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, which would preclude them from achieving an “A” grade.

B. Above average - Trees with good to very good structure for their species. They exhibit trunk and branch arrangement and orientation that result in a relatively sturdy form or architecture that resists failure under

normal circumstances, but may have some mechanical damage, over-pruning, or other minor structural defects. The spacing, orientation, and size of the branches relative to the trunk are still in the normal range for the species, but they exhibit a minor degree of defects. Minor, sub-critical levels of decay or pathological disease may be present, but the degree of damage is not yet structurally significant. Trees that exhibit naturally inherent branching defects, like multiple, narrow points of attachment from one point on the trunk, would generally fall in to this category. A small percentage of the canopy may be shaded or crowded, but not in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree.

C. Average - Trees with moderately good structure for their species, but with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a less than sturdy form or architecture, which reduces their resistance to failure under normal circumstances. Moderate levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of some of the branches relative to the trunk are not in the normal range for the species. Moderate to significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A moderate to significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be moderately elevated.

D. Well Below Average/Poor - Trees poor structure for their species and with obvious defects. They exhibit trunk and branch arrangement and orientation that result in a significantly less than sturdy form or architecture, significantly reducing their resistance to failure under normal circumstances. Significant levels of mechanical damage, over-pruning, or other structural defects may be present. The spacing, orientation, and size of many of the branches relative to the trunk are not in the normal range for the species. Significant levels of decay or pathological disease may be present that increase the likelihood of structural instability. Influences such as an excessive trunk lean, slope erosion, root pruning, or other growth-inhibiting factors may be present. A significant percentage of the canopy may be shaded or crowded in such a way that it is expected to negatively impact the structural integrity or lifespan of the tree. Risk of full or partial failure in the near future appears to be advanced.

F. Severely Compromised – trees with very poor structure and numerous or severe defects due to growing conditions, historical or recent pruning, mechanical damage, history of limb or trunk failures, advanced and irreparable decay, disease, or severe fire damage. Trees with this rating are in severe, irreparable decline, or are barely alive. Risk of full or partial failures in the near future may be severe.

ARBORIST DISCLOSURE STATEMENT

Arborists are tree specialists who use their education, knowledge, training and experience to examine trees, recommend measures to enhance the beauty and health of trees, and attempt to reduce the risk of living near trees. Clients may choose to accept or disregard the recommendations of the arborist, or to seek additional advice.

Arborists cannot detect every condition that could possibly lead to the structural failure of a tree. Trees are living organisms that fail in ways we do not fully understand. Conditions are often hidden within trees and below ground. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time. Likewise, remedial treatments, like any medicine, cannot be guaranteed.

Treatment, pruning and removal of trees may involve considerations beyond the scope of the arborist's services such as property boundaries, property ownership, site lines, disputes between neighbors, and other issues. Arborists cannot take such considerations into account unless complete and accurate information is disclosed to the arborist. An arborist should then be expected to reasonably rely upon the completeness and accuracy of the information provided.

Trees contribute greatly to our enjoyment and appreciation of life. Nonetheless, they are subject to the laws of gravity and physiological decline. Therefore, neither arborists nor tree owners can be reasonably expected to warrant unfailing predictability or elimination of risk.

Trees can be managed, but they cannot be controlled. To live near trees is to accept some degree of risk. The only way to eliminate all risk associated with trees is to eliminate all trees.

Risk assessments were neither requested nor performed on any of the trees for this project.

CY CARLBERG
CARLBERG ASSOCIATES
828 Fifth Street, Suite 3 • Santa Monica • California • 90403
cy@cycarlberg.com • o: 310.451.4804 • www.cycarlberg.com

Education
B.S., Landscape Architecture, California State Polytechnic University, Pomona, 1985
Graduate, Arboricultural Consulting Academy, American Society of Consulting Arborists, Chicago, Illinois, February 2002
Graduate, Municipal Forestry Institute, Lied, Nebraska, 2012

Experience
Consulting Arborist, Carlberg Associates, 1998-present
Manager of Grounds Services, California Institute of Technology, Pasadena, 1992-1998
Director of Grounds, Scripps College, Claremont, 1988-1992

Certificates
Certified Arborist (#WE-0575A), International Society of Arboriculture, 1990
Registered Consulting Arborist (#405), American Society of Consulting Arborists, 2002
Certified Urban Forester (#013), California Urban Forests Council, 2004
Qualified Tree Risk Assessor, International Society of Arboriculture, 2011

AREAS OF EXPERTISE

Ms. Carlberg is experienced in the following areas of tree management and preservation:

- Tree health and risk assessment
- Master Planning
- Historic landscape assessments, preservation plans, reports
- Tree inventories and reports to satisfy jurisdictional requirements
- Expert Testimony
- Post-fire assessment, valuation, and mitigation for trees and native plant communities
- Value assessments for native and non-native trees
- Pest and disease identification
- Guidelines for oak preservation
- Selection of appropriate tree species
- Planting, pruning, and maintenance specifications
- Tree and landscape resource mapping – GPS, GIS, and AutoCAD
- Planning Commission, City Council, and community meetings representation

PREVIOUS CONSULTING EXPERIENCE

Ms. Carlberg has overseen residential and commercial construction projects to prevent damage to protected and specimen trees. She has thirty-five years of experience in arboriculture and horticulture and has performed tree health evaluation, value and risk assessment, and expert testimony for private clients, government agencies, cities, school districts, and colleges. Representative clients include:

The Huntington Library and Botanical Gardens
The Los Angeles Zoo and Botanical Gardens
The Rose Bowl and Brookside Golf Course, Pasadena
Walt Disney Concert Hall and Gardens
The Art Center College of Design, Pasadena
Pepperdine University
Loyola Marymount University
The Claremont Colleges (Pomona, Scripps, CMC, Harvey Mudd, Claremont Graduate University, Pitzer, Claremont University Center)
Quinn, Emanuel, Urquhart and Sullivan (attorneys at law)
Getty Trust – Eames House
Historic Resources Group
The City of Claremont
The City of Beverly Hills
The City of Pasadena
The City of Los Angeles
The City of Santa Monica
Santa Monica/Malibu Unified School District
San Diego Gas & Electric
Los Angeles Department of Water and Power
Rancho Santa Ana Botanic Garden, Claremont
Latham & Watkins, LLP (attorneys at law)
Architectural Resources Group
AHBE Landscape Architects
Moule and Polyzoides, Architects and Urbanists

AFFILIATIONS

Ms. Carlberg serves with the following national, state, and community professional organizations:

- California Urban Forests Council, Board Member, 1995-2006
- Street Tree Seminar, Past President, 2000-present
- American Society of Consulting Arborists Academy, Faculty Member, 2003-2005; 2014
- American Society of Consulting Arborists, Board of Directors, 2013-2015
- Member, Los Angeles Oak Woodland Habitat Conservation Strategic Alliance, 2010-present

APPENDIX C

Cultural Resources Phase I Assessment

September 22, 2023

LAUSD Office of Environmental Health and Safety
333 South Beaudry Avenue, 21st Floor
Los Angeles, California 90017

Attn: Mr. Julian Capata, CEQA Project Manager

Subj: Cultural Resources Phase I Assessment for Canoga Park High School – Major Modernization Project *(Envicom Project #2023-073-01)*

Dear Mr. Capata:

Envicom Corporation (Envicom) has completed a Phase I Cultural Resource Assessment for the Canoga Park High School – Major Modernization Project (Project) located in the City of Los Angeles, within the County of Los Angeles, California (**Figure 1** and **Figure 2**). The Project will remove existing buildings, construct new buildings, and upgrade infrastructure on the current Los Angeles Unified School District (LAUSD) property. The general location of the Project is as follows:

United States Geological Survey 7.5' Quadrangles: Canoga Park
Township: 2 North Range: 16 West
Latitude: 34°11'43.39"North Longitude: 118°36'19.21"West

The Phase I Cultural Resource Assessment included a cultural resource record search conducted by the South Central Coastal Information Center (SCCIC) and a Native American cultural resource record search conducted by the California Native American Heritage Commission (NAHC). Both record searches examined the Project property plus a 0.25-mile buffer area ("study area") around the Project site (see Figure 1). The purpose of a cultural resource record search is to identify any known cultural resources previously recorded within or immediately adjacent to the proposed Project development site, to provide cultural resource context for the Project from the examination of the study area, and to assess the overall cultural resource sensitivity of the Project region.

Additional databases examined during the Phase I cultural resource assessment included historical regional maps, historical United States Geological Survey (USGS) maps, and historical Google Earth images. The University of California Santa Barbara (UCSB) Library Historical Aerial Photograph Database was also examined. Since the cultural resource assessment was negative for cultural resources within or adjacent to the Project development site, a letter report format will be used for the cultural resource report (this document). Because fossil resources were also of concern for the Project, the Natural History Museum of Los Angeles County (NHM) was also asked to examine their database of fossil resources for previously discovered fossils on or near the subject property.

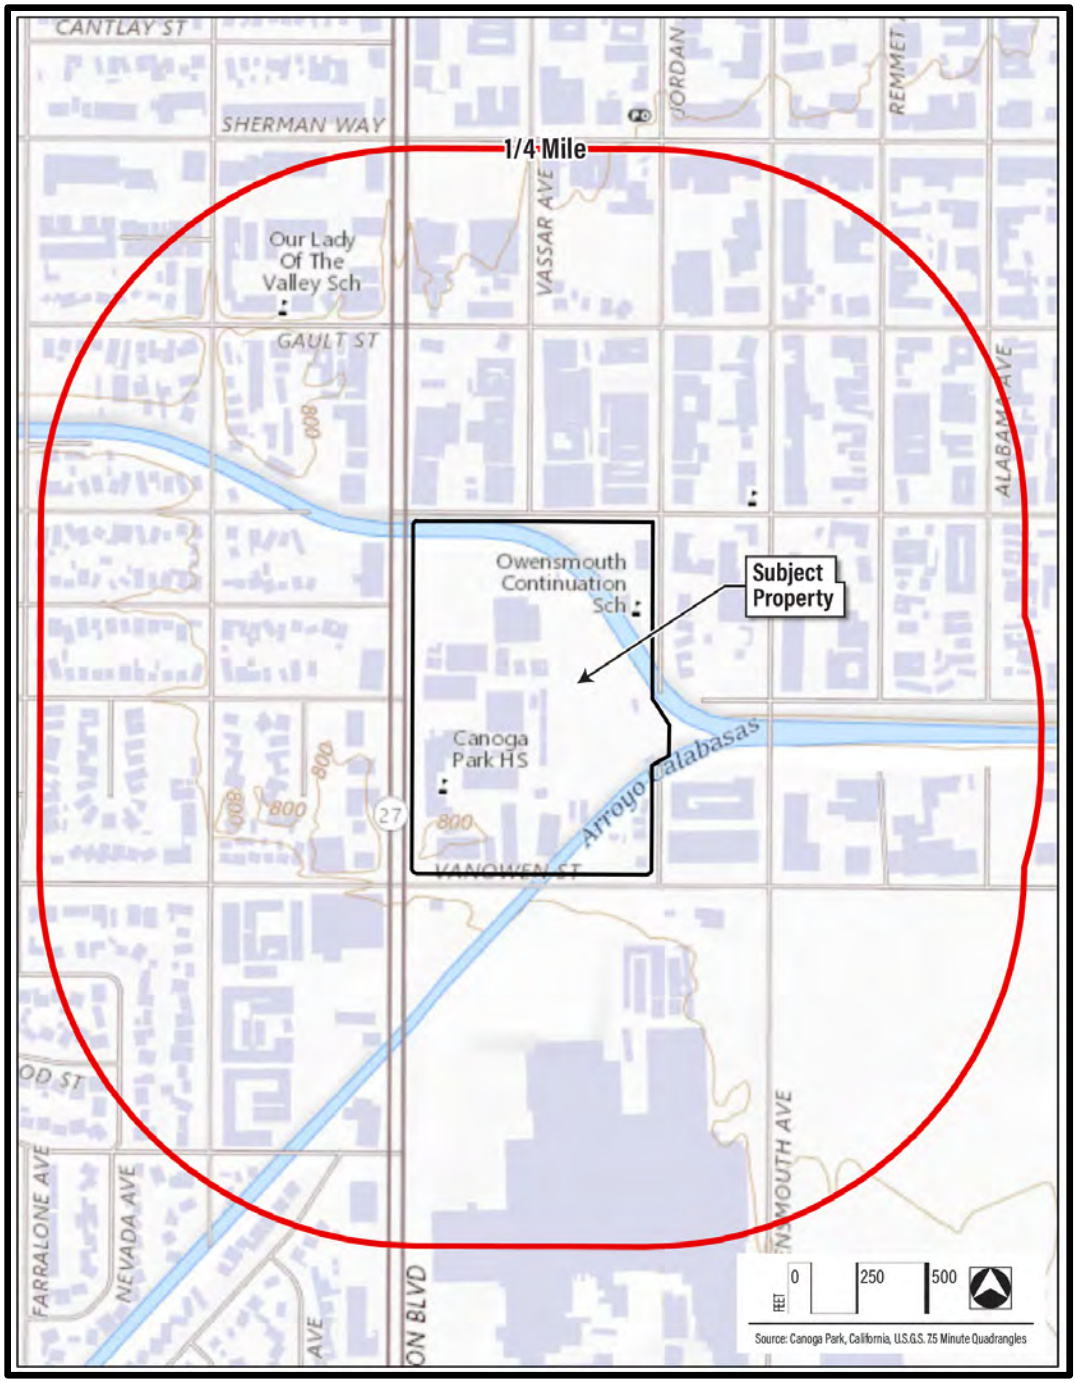

Figure 1: Project location in Los Angeles County, California, with the 0.25-mile study area shown (2023 Canoga Park Quadrangle Topographic Map).

Figure 2: The Project site, showing the current site conditions (2020 Google Earth Image).

A cultural resource is often defined as any building, structure, object, or archaeological site older than 50-years in age and can include historical or prehistoric locations of human habitation or occupation. This definition is provided by the California Office of Historic Preservation guidelines, United States Department of the Interior guidelines, and as per *36 Code of Federal Regulations 60.4* of the National Register criteria.

The Phase I cultural resource assessment also often includes a pedestrian survey of the Project property. However, due to the urban nature of the property, a pedestrian survey was not conducted for the Project, and a desktop examination ("desktop survey") of the site was instead conducted. The Phase I cultural resource assessment additionally often includes a discussion of built environment cultural resources found on the subject property or in the surrounding study area. However, a separate, stand-alone built environment resource report was produced by Sapphos Environmental, Inc. in 2014 with the findings published in a document titled *Los Angeles Unified School District Historic Resources Survey Report*. This built environment report assessed the Canoga Park High School and associated historical structures. The findings from this report will be presented in the Project entitlement documents and not duplicated in this cultural resource report.

RECORD SEARCH RESULTS

SCCIC and NAHC Record Searches

On July 11, 2023, Envicom submitted a request to the SCCIC to conduct a search of their database for previously recorded cultural resources located within the Project property, and within the surrounding Project study area (defined as the Project development site, plus a 0.25-mile buffer area) for regional cultural resource context (see Figure 1). The record search included a request for all previously recorded cultural resource site records within or adjacent to the Project site, as well as copies of all cultural resource technical reports that intersected with all or part of the Project development site. Envicom also contacted the NAHC on July 11, 2023, with a similar record search request to examine their sacred lands files for tribal cultural resources located on the Project property or within the surrounding study area.

Envicom received the cultural resource records search results from the SCCIC on August 20, 2023. The SCCIC record search found no previously recorded cultural resources located within the Project property, however three (3) previously recorded cultural resources were located within the 0.25-mile surrounding study area. The three cultural resources are all historical buildings, which will have no effect on the Project. Again, all built environment concerns for the Project area assessed in the Sapphos 2014 report.

The SCCIC found no previously cultural resource report that involved the Project property, however, seven (7) cultural resource reports that involved part of the Project 0.25-mile study area were identified. Review of these reports did not recognize any specific cultural or historical resources of concern for the Project. All relevant cultural resource reports provided by the SCCIC are summarized in **Appendix A** of this report.

The results from the 2023 NAHC record search were received on August 13, 2023, with negative findings. If the Lead/Permitting Agency for the Project is required to perform an Assembly Bill

(AB)-52 process, the NAHC letter should be made a part of the Native American consultation record. Envicom did not contact Native American groups on the NAHC list, as communications with Tribal Group representatives is the responsibility of the Lead/Permitting Agency, if required for this Project.

Examination of the State of California SCCIC database of previously recorded cultural resources and the NAHC Sacred Lands database were both, therefore, ***negative for cultural resources within the Project development site.*** Any findings from the SCCIC as to the physical location of cultural resources, except for public-knowledge built environment resources, is considered confidential by state law and are, therefore, not included in this report. Copies of the request letter to the SCCIC and NAHC are included in **Appendix B** of this report, as are the response letters from the NAHC. The Principal Author's resume is provided in **Appendix C**.

Historical Site Information

The Phase I Environmental Site Assessment Report (ESA), produced by ECO and Associates for the Project in 2019, has an excellent history of the Project property and the development of the Canoga High School campus. This history reads as follows:

> "Based on data collected during this assessment, the Site was undeveloped and vacant up to approximately 1914. In 1915, the Site was developed as Owensmouth High School with a single relatively large building (main classroom and administration building) located on the northwestern part of the property. Since 1931, the school has been referred to as Canoga Park High School.
>
> "In 1928, the school was comprised of a relatively large main building (main classroom and administration building) and three smaller buildings south of the main building located in the Site's northwestern portion including the Girls Gym building. The eastern half of the Site was primarily open land, with an agricultural grove in the southeast portion, and Bell Creek and Calabasas Creek, both creeks flowing toward the east. Between 1928 and 1938, two additional large school buildings, facing Topanga Canyon Boulevard and used as administration and for classrooms, were added in the southwest portion of the Site. Within that same period, the oval athletic track was moved to its current location in the central portion of the east half of the Site.
>
> "In 1939, the assembly hall was added on the Site's southwestern portion. Between 1952 and 1959, the original large school building and another small building, located in the northwest portion of the Site, were removed and converted to an athletic field. Between 1954 and 1958, the Cafeteria, the Boys Physical Education building, Class Room Building (Clrm Bldg) #2, Shop #2, and four storage buildings located south of the oval athletic track field were added. In 1960 and 1968, Clrm Bldg #3, the Music Building, Storage Unit Building #014DOP, and Clrm Bldg #4 were added.
>
> "During the period between 1974 and 1979, a major remodeling occurred that included removal of the two large main school buildings located on the southwest portion of the Site

facing Topanga Canyon Boulevard as well as the cement concrete walks connecting the buildings. These were replaced by two other large buildings referred to as building Unit #1 and building Unit #2."

Historical Map Database Search

Examination of historic maps included seventeen (17) historical USGS maps, dating to between 1903 and 1979. The 1903 Calabasas USGS map shows no improvement within the Project development site but does show a dirt road near the Project property (**Figure 3**). The 1925 Dry Canyon USGS map shows the north part of the property as developed with a school building, with two additional structures on the property (**Figure 4**). The 1932 Dry Canyon USGS map shows the same buildings associated with the school, with two additional school campus buildings to the south (**Figure 5**). The oldest aerial photograph in the UCSB Library historic aerial photography database is from 1939 (**Figure 6**). This photo shows the Project property as fully developed with school campus buildings and support features, with additional residential and commercial buildings in the surrounding region.

The 1952 Canoga Park USGS map shows the Project site as fully developed, with the Canoga High School campus consisting of several larger buildings and multiple smaller structures (**Figure 7**). Examination of historic Google Earth satellite images show the Project site and surrounding region from 1985 to present, with constant in-filling of the region with residential and commercial development. The Project property is shown to be fully developed in 1989, however, the oldest building in the northern part of the property, which was still visible in 1952, is no longer present (**Figure 8**).

Based on the ESA history and the historical maps and aerial images, the oldest historical structures that have been located on the property date to 1915, with several additional buildings being added to the site prior to World War II (1945), including the 1939 auditorium building. Since the period of sensitivity for older historical cultural resources is often noted as being before the post-World War II economic and population expansion in Southern California, the Project property should be considered as being sensitive for older cultural resources.

The examination of historical map and aerial photograph databases was, therefore, ***positive for the potential for older historical cultural resources being found within the Project development site during Project subsurface construction***. No other pre-construction phase assessment tasks are recommended by Envicom. However, when Project sites are considered to be sensitive for older historical cultural resources, Envicom recommends monitoring of subsurface grading and trenching activities during the Project construction-phase.

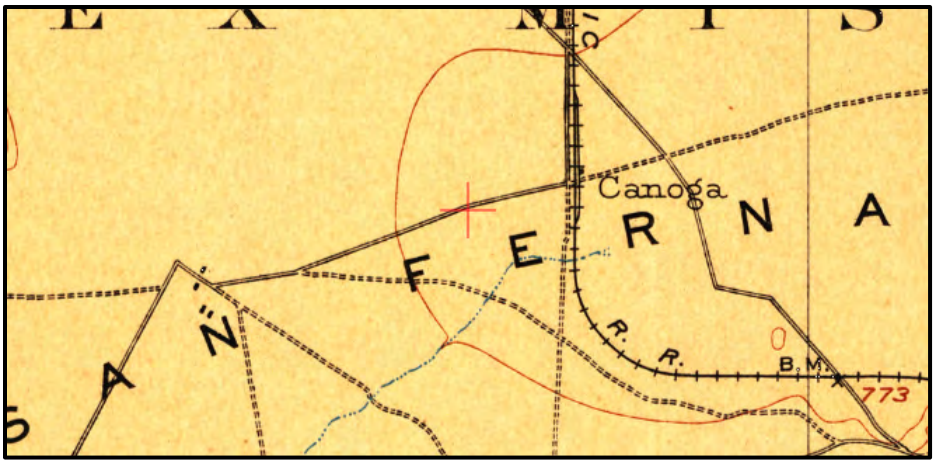

Figure 3: The 1903 Calabasas USGS Map
(red cross marks the general Project location).

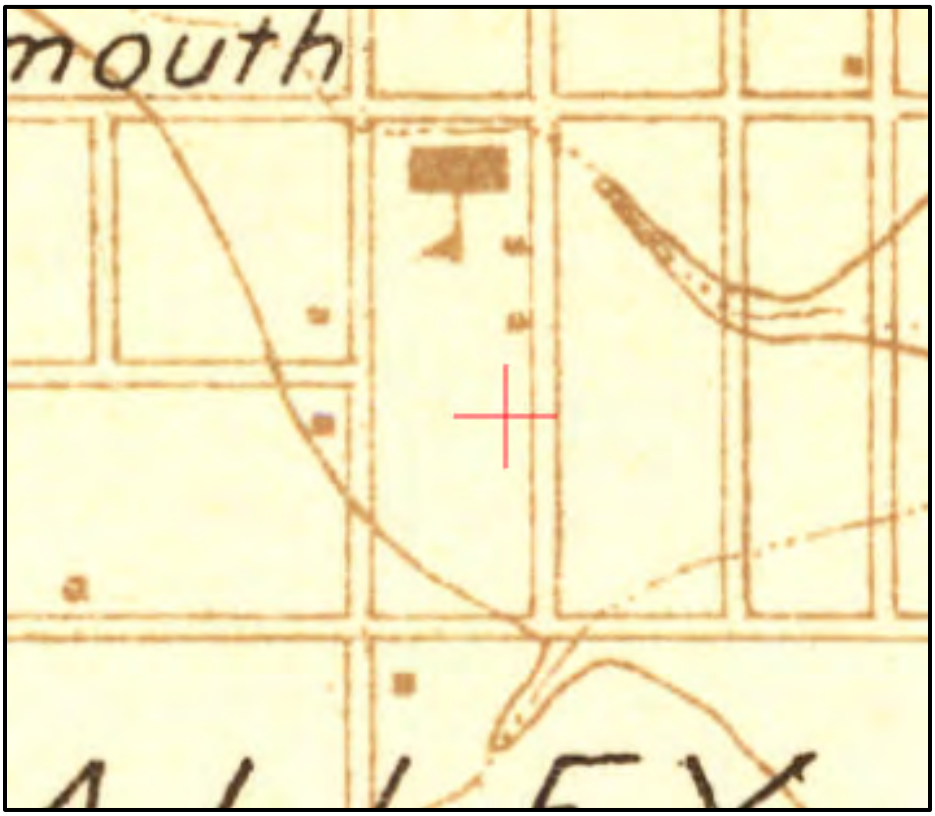

Figure 4: The 1925 Dry Canyon USGS Map
(red cross marks the general Project location).

Figure 5: The 1932 Dry Canyon USGS Map (red cross marks the Project location).

Figure 6: The Project site (center) in a 1939 image, showing multiple school buildings and support features on the subject property (UCSB Historic Aerial Image Database).

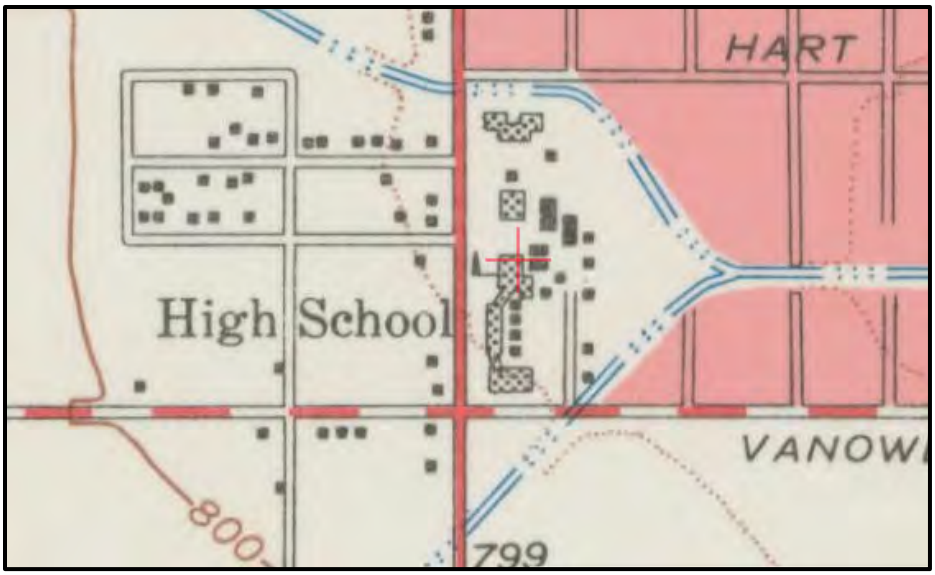

Figure 7: The 1952 Canoga Park USGS Map (red cross marks the Project location).

Figure 8: The Project property in 1989; note that the northern building is no longer present on the property (Google Earth Image).

Desktop Survey Results

The Project site is currently a fully developed high school campus, with numerous educational buildings that have been constructed during different time periods. Several support structures and other facilities are also found on the property, including maintenance buildings, a soccer field, basketball courts, and an oval track (**Figure 9, Figure 10**, **Figure 11**, and **Figure 12**). The desktop survey of the property did not identify any areas of concern regarding cultural resources, such as large undisturbed open space areas or visible rock outcrops. The desktop survey results were, therefore, ***negative for observable cultural resource issues within the Project site***.

Figure 9: Overview showing the Project site.

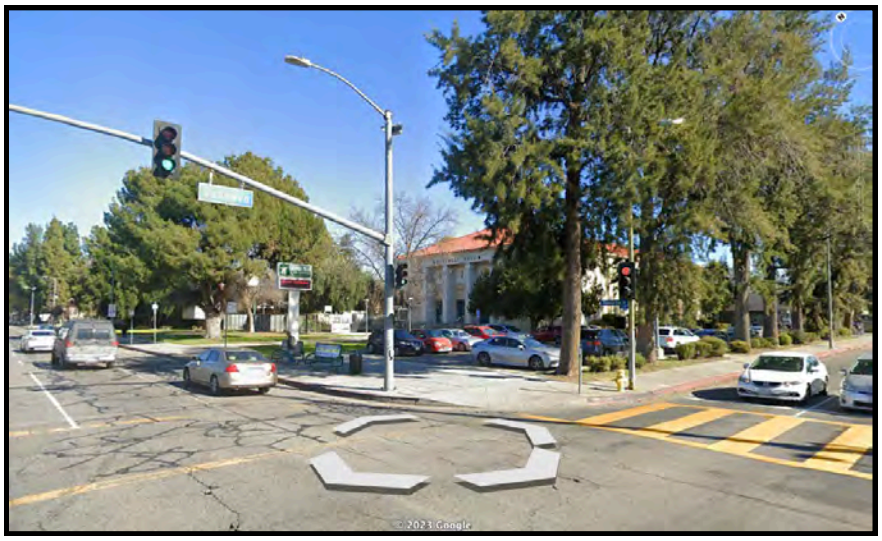

Figure 10: Overview showing the Project site southeast corner.

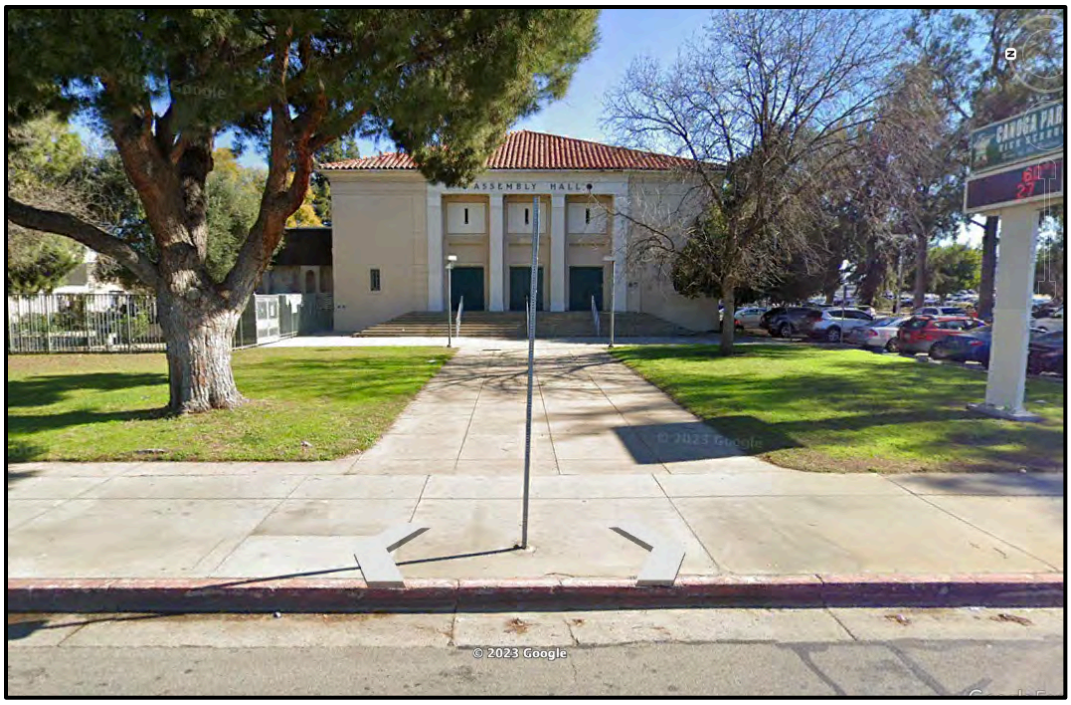

Figure 11: The 1939 Canoga High School Auditorium.

Figure 12: Overview showing the Project site from a different direction.

Paleontological Record Search Results

Envicom contacted the NHM on July 11, 2023, with a request to examine their fossil locality records to assess whether fossils had been found in the past on the Project property. The NHM also provides an overall sensitivity assessment for the Project region, which can then be used to determine whether further assessment of the project is needed for paleontological resources, or whether monitoring is recommended.

The NHM record search findings were received on July 16, 2023. No fossil resources had been found on the subject property, however, the NHM indicated that the Project is located within a region considered to be sensitive for paleontological resources. The NHM recommended that a paleontological assessment of the area by a paleontologist meeting the Bureau of Land Management of Society of Vertebrate Paleontology standards. As this is a standard NHM recommendation, and due to the developed nature of the Project property that has no exposed rock units or bedrock formations, Envicom does not recommend the production of a separate paleontological report for the Project. Finally, the NHM recommended that, if fossils were found during construction, that a sediment sample is collected with the fossil. The response letter from the NHM is also located in Appendix B of this report.

The Project geological report, titled *Preliminary Geotechnical Evaluation, Canoga Park High School, Major Modernization, 6850 Topanga Canyon Boulevard, Canoga Park, California,* and written in 2022 by Gorian and Associates, indicated that the entire property was located over Holocene (modern) alluvial deposits (**Figure 13**). The report also indicated that construction would mostly be within current building footprints and terrain cuts, indicating that Project features that normally encounter deeper rock formations, such as underground garage levels, will not be part of the modernization project. Since the Project property is covered with modern alluvial material and Project excavation will not involve exceptional depth, Envicom does not recommend further paleontological assessment or monitoring during site trenching or grading.

RECOMMENDATIONS

The results of the SCCIC and NAHC database record searches were negative for cultural resources within the Project development site. The historical map and aerial photograph database search was, however, positive for the site being sensitive for older historical cultural resources to be encountered during Project grading and excavation. The desktop survey was negative for cultural resource issues, as was the Project paleontological assessment. Envicom does not recommend further assessment of the Project for cultural or paleontological resources, however, Envicom recommends archaeological monitoring during construction activities. Envicom also recommends contingency measures for situations where cultural or fossil resources are unexpectedly encountering during grading.

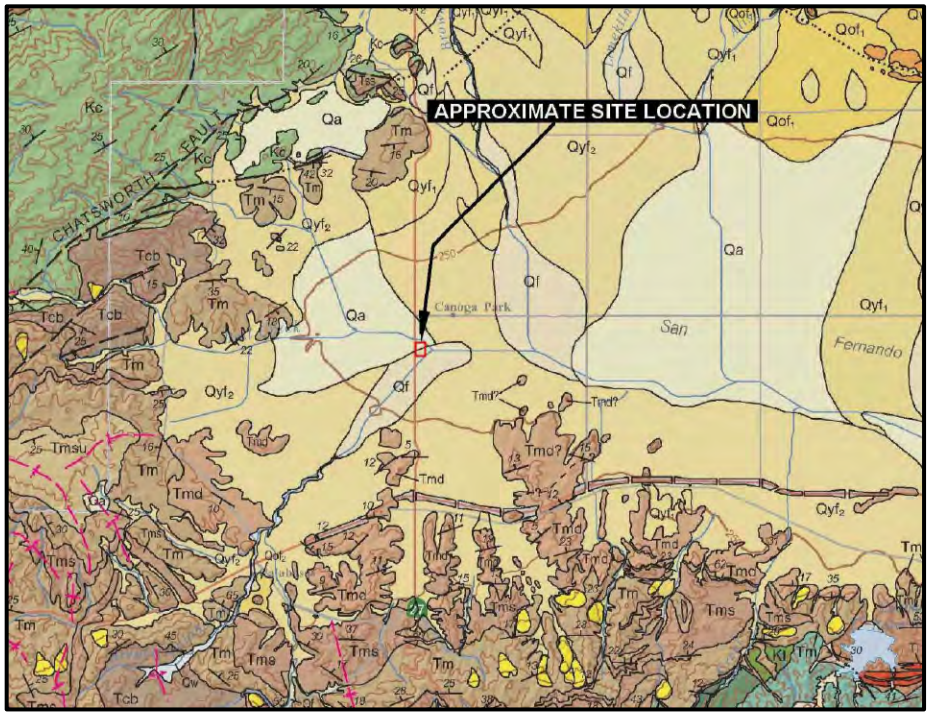

Figure 13: The Project property is located on Holocene (modern) alluvial deposits (from the 2022 Gorian and Associates Project Geotechnical Report)

Recommendation 1: Archaeological Monitoring.

An archaeological monitor that meets the Secretary of Interior qualifications will be on site during grading of the Project site from surface to the bottom of subsurface activity. Fill deposits do not have to be monitored. The purpose of having an archaeologist on site is to assess if any significant cultural resources are encountered during grading. Archaeological monitoring will start with full-time monitoring, however, if the monitoring team determines that native soils have been removed during previous earth moving activities on the site, or if large parts of the site are disturbed or covered with fill, then monitoring can be reduced to spot-check or contingency monitoring only.

The archaeological monitor will collect any diagnostic prehistoric or older historical material uncovered through Project excavation and can halt construction within 50-feet of a potentially significant cultural resource if necessary. Artifacts collected from a disturbed context or that do not warrant additional assessment can be collected without the need to halt grading. Discovery situations that do not lead to further assessment, survey, evaluation, or data recovery can be described in the monitor's daily monitoring log. However, if prehistoric features or older historical features are encountered, the Project "discovery" protocol should be followed (see below). A final Monitoring Report will be produced that discusses all monitoring activities and all artifacts recovered and features identified through monitoring on the Project site. Discovery situations that do not lead to further assessment, survey, evaluation, or data recovery can be described in the final Monitoring Report.

All artifacts recovered that are determined to have historical information value, with diagnostic or location information that may be important to California history, will be cleaned, analyzed, and described within the Monitoring Report. All materials determined important will be curated at an appropriate depository or returned to the landowner for public display if possible. If important materials are found during monitoring, a Curation Plan may be needed that is reviewed by the Lead Agency prior to the publication of the Monitoring Report. The costs of the Monitoring Report, the Curation Plan, and the processing, analysis, and curation of all artifacts will be the responsibility of the applicant.

Recommendation 2: Archaeological or Fossil Resource Discovery Protocol

If potentially significant intact archaeological or fossil deposits are encountered within an undisturbed context, then a cultural/fossil resource "discovery" protocol will be followed. If older historical or prehistoric features, artifact concentrations, or significant fossils are encountered during Project grading within native soils or original context, then all work in that area shall be halted or diverted away from the discovery to a distance of 30-feet until a qualified senior archaeologist/paleontologist can evaluate the nature and/or significance of the find(s). If a senior archaeologist/paleontologist confirms that the discovery is potentially significant, then the Lead/Permitting Agency will be contacted and informed of the discovery.

Construction will not resume at the locality of the discovery until consultation between the senior archaeologist/paleontologist, the owner's Project manager, the Lead/Permitting Agency, and any other concerned parties (such as additional regulatory agencies or Native American Tribal Groups), takes place and reaches a conclusion approved by the Lead/Permitting Agency. If a significant cultural or fossil resource is discovered during earth-moving, complete avoidance of the find is preferred. However, if the discovery cannot be avoided, further survey work, evaluation tasks, or data recovery of the significant resource may be required by the Lead/Permitting Agency. The Lead/Permitting Agency may also require additional site monitoring, based on the discovery. All individual reports will be submitted to the SCCIC or to the NHM at the conclusion of the Project.

Recommendation 3: Inadvertent Discovery of Human Remains

The inadvertent discovery of human remains is always a possibility during ground disturbances; State of California Health and Safety Code Section 7050.5 addresses these findings. This code section states that in the event human remains are uncovered, no further disturbance shall occur until the County Coroner has made a determination as to the origin and disposition of the remains pursuant to California Public Resources Code Section 5097.98. The Coroner must be notified of the find immediately, together with the City and the property owner.

If the human remains are determined to be prehistoric, the Coroner will notify the NAHC, which will determine and notify a Most Likely Descendant (MLD). The MLD shall complete the inspection of the site within 48 hours of notification and may recommend scientific removal and nondestructive analysis of human remains and items associated with Native American burials and

an appropriate re-internment site. The Lead/Permitting Agency and a qualified archaeologist shall also establish additional appropriate mitigation measures for further site construction.

Sincerely,

Dr. Wayne Bischoff, Principal

Date of CHRIS Data Provided for this Request: _____

Confidential Data Included in Response: yes ☐ / no ☐

Notes: _____

CHRIS Data Request Form

Mark the request form as needed. Attach a PDF of your project area (with the radius if applicable) mapped on a 7.5' USGS topographic quadrangle to scale 1:24000 ratio 1:1 neither enlarged nor reduced and include a shapefile of your project area, if available. Shapefiles are the current CHRIS standard for submitting digital spatial data for your project area or radius. **Check with the appropriate IC for current availability of digital data products.**

- Documents will be provided in PDF format. Paper copies will only be provided if PDFs are not available at the time of the request or under specially arranged circumstances.
- Location information will be provided as a digital map product (Custom Maps or GIS data) unless the area has not yet been digitized. In such circumstances, the IC may provide hand drawn maps.
- In addition to the $150/hr. staff time fee, client will be charged the Custom Map fee when GIS is required to complete the request [e.g., a map printout or map image/PDF is requested and no GIS Data is requested, or an electronic product is requested (derived from GIS data) but no mapping is requested].

For product fees, see the CHRIS IC Fee Structure on the OHP website.

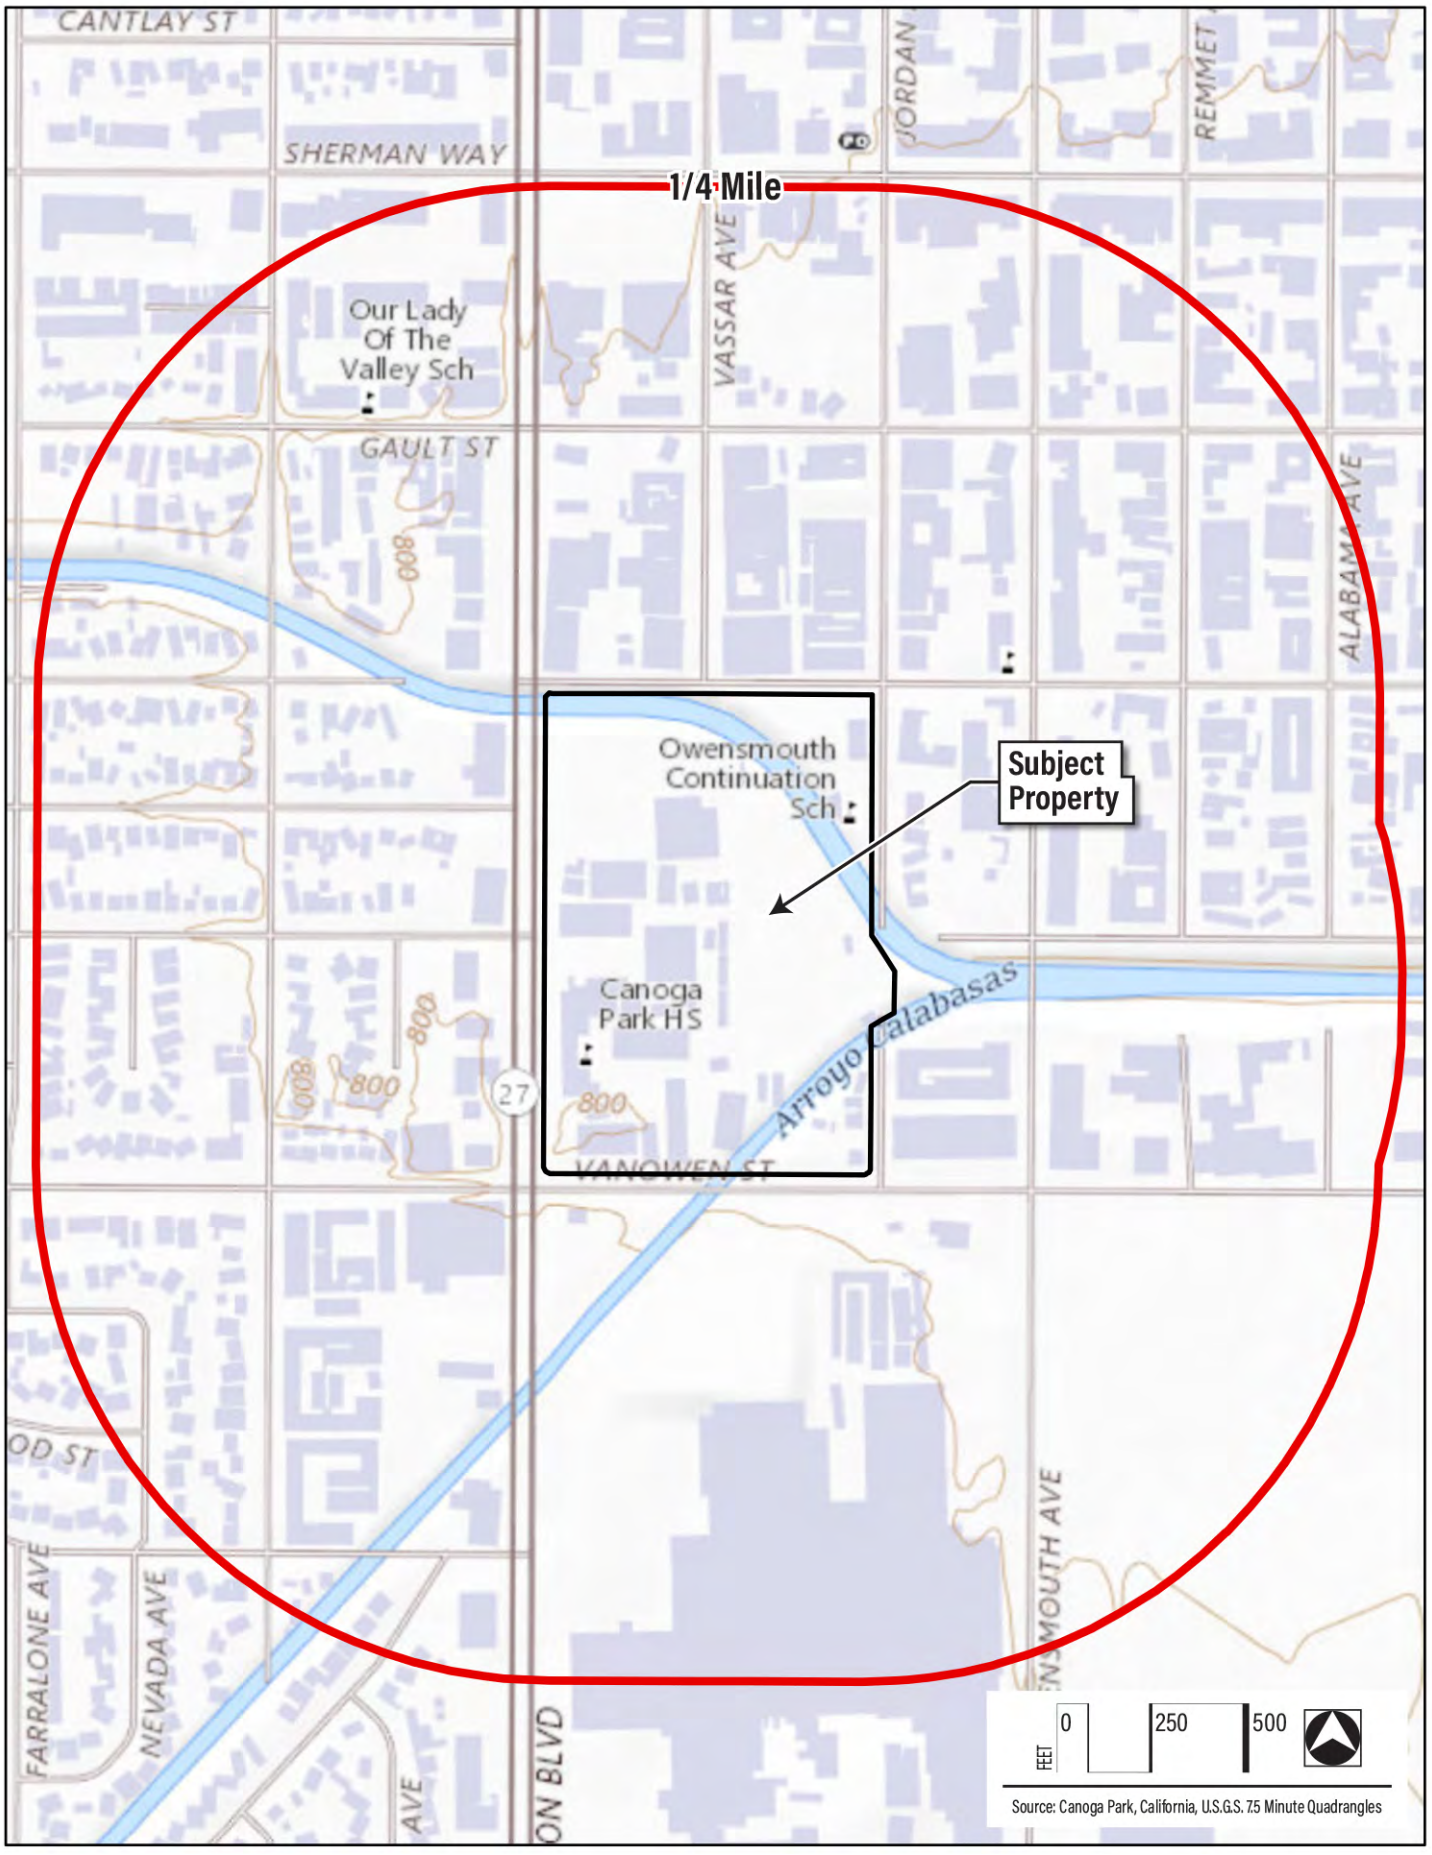
---



[1] In order to receive archaeological information, requestor must meet qualifications as specified in Section III of the current version of the California Historical Resources Information System Information Center Rules of Operation Manual and be identified as an Authorized User or Conditional User under an active CHRIS Access and Use Agreement.

[2] "Other" Reports GIS layer consists of report study areas for which the report content is almost entirely non-fieldwork related (e.g., local/regional history, or overview) and/or for which the presentation of the study area boundary may or may not add value to a record search.

[3] Provided as Excel spreadsheets with no cost for the rows; the only cost for this component is IC staff time. Includes, but not limited to, information regarding National Register of Historic Places, California Register of Historical Resources, California State Historical Landmarks, California State Points of Historical Interest, and historic building surveys. Previously known as the HRI and then as the HPD, it is now known as the Built Environment Resources Directory (BERD). The Office of Historic Preservation compiles this documentation and it is the source of the official status codes for evaluated resources.

[4] Associated documentation will vary by resource. Contact the IC for further details.

[5] Provided as Excel spreadsheets with no cost for the rows; the only cost for this component is IC staff time. Previously known as the Archaeological Determinations of Eligibility, now it is known as the Archaeological Resources Directory (ARD). The Office of Historic Preservation compiles this documentation and it is the source of the official status codes for evaluated resources.

Re: Canoga Park High School Major Modernization Project, Los Angeles County

Dear Dr. Bischoff:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

July 16, 2023

Envicom Corporation
Attn: Samantha Renta

re: Paleontological resources for the Canoga Park High School Major Modernization Project (Envicom Project #2023-073-01)

Dear Samantha:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for proposed development at the Canoga Park High School Major Modernization project area as outlined on the portion of the Canoga Park USGS topographic quadrangle map that you sent to me via e-mail on July 11, 2023. We do not have any fossil localities that lie directly within the proposed project area, but we do have fossil localities nearby from the same sedimentary deposits that occur in the proposed project area, either at the surface or at depth.

The following table shows the closest known localities in the collection of the Natural History Museum of Los Angeles County (NHMLA).

Locality Number	Location	Formation	Taxa	Depth
LACM VP 5878	Along Long Valley Road just north of Hidden Hills	Unknown formation (Pleistocene)	Mastodon (*Mammut*)	Unknown
LACM VP 1817	Southeast corner of Plummer & Farralone; Chatsworth	Unknown formation (Pleistocene)	Horse (*Equus*)	3 feet bgs
LACM VP 3822	Calvert St, S of Sylvan Park School, Van Nuys	Unnamed lacustrine deposit (Pleistocene)	Bison (*Bison*)	75-100 feet bgs
LACM VP 6208	Burbank Blvd. & Kester Ave. in Van Nuys	Unknown formation (Pleistocene)	Bison (*Bison*)	20 feet bgs
LACM VP 3263	5112 Kester Ave	Unknown (Pleistocene)	Horse family (Equidae)	11-20 feet bgs (sewer excavations)

VP, Vertebrate Paleontology; IP, Invertebrate Paleontology; bgs, below ground surface

This records search covers only the records of the NHMLA. It is not intended as a paleontological assessment of the project area for the purposes of CEQA or NEPA. Potentially fossil-bearing units are present in the project area, either at the surface or in the subsurface. As

such, NHMLA recommends that a full paleontological assessment of the project area be conducted by a paleontologist meeting Bureau of Land Management or Society of Vertebrate Paleontology standards.

Sincerely,

Alyssa Bell, Ph.D.
Natural History Museum of Los Angeles County

Paleontological Assessments

Built Environment Assessments

Ethnographic Reports

Dr. Bischoff has over 25 years of experience in managing cultural resource projects and ensuring compliance with the California Environmental Quality Act (CEQA), Section 106 of the National Historic Preservation Act NHPA , the National Environmental Protection Act NEPA , and state, county, city, and local government cultural laws, guidelines, and procedures. He has managed cultural, paleontological, ethnographic, and built environment projects throughout Southern California, including the Counties of Ventura, Los Angeles, Kern, Imperial, San Diego, Orange, Santa Barbara, Riverside, and San Bernardino. Dr. Bischoff has been the principal or project manager for hundreds of cultural resource projects in Southern California, including record searches, surveys, evaluations, and data recoveries, built environment and historic architectural inventories, HABS projects, paleontological surveys, ethnographic reports and Native American consultation, and historic structure evaluations. Dr. Bischoff has worked with all Tribal Groups of the Greater Los Angeles area and has provided expert consultation, including Assembly Bill AB 52 consultation, writing support, and coordination. He has also written, planned, and enforced cultural resource components of many forms of CEQA and NEPA documents and been a part of Memorandum of Agreement MOA, Memorandum of Understanding MOU , and Programmatic Agreement PA development teams.

Dr. Bischoff's experience includes residential and commercial development, public works, storm and sewer projects, environmental restoration, water resources, energy and transmission line, highway and bridge, telecommunication, educational facility, and park and trail project. Dr. Bischoff has been the principal or project manager for hundreds of cultural projects in California, including Phase I literature searches and surveys, Phase I b subsurface surveys, Phase II evaluations, and Phase III data recoveries. He has also completed built environment and standing structure architectural inventories, assessments, and historic structure evaluations in select municipalities.

Dr. Bischoff also has extensive experience consulting with state and federal agencies, including the State Historic Preservation Office SHPO, California Department of Transportation Caltrans , the Department of Defense, the General Services Agency GSA , California Department of Parks and Recreation, the U.S. Department of Agriculture USDA , many U.S. Army Corps of Engineers (ACOE) districts, Fish and Wildlife, the California Public Utilities Commission CPUC , the National Park Service, the USFS, the NTIA, Federal Highway Administration, and the Port Authorities of several cities.

REPRESENTATIVE PROJECT EXPERIENCE

Data Recovering & Monitoring, Gateway at The Oaks Project, Thousand Oaks, Ventura County, California

Principal and Project Manager for the upcoming recovery and monitoring tasks for development of Gateway at The Oaks on 8.8 acres. Envicom Corporation (Envicom) is scoped to provide project compliance with Environmental Impact Report (EIR) mitigation measures addressing: retention of a qualified archaeologist, data recover excavations, cultural resources sensitivity training, development and implementation of cultural resources monitoring and treatment plan, and protocols for unanticipated discovery of archaeological resources or human remains.

Phase I Survey, Latigo Hillcrest Project (2500 W. Hillcrest Drive), Thousand Oaks, Ventura County, California

Principal and Project Manager for the Phase I Survey for Cultural Resources. Project included a site visit and SCCIC/NAHC and NHM record searches and an impact assessment report for the 8.19-acre property. Dr. Bischoff is also scoped to provide support to the City in its outreach to the local Native American Tribe(s) to offer consultation on the issue of Tribal Cultural Resources under CEQA.

Phase I Survey, T.O. Ranch (325 and 391 Hampshire Road), Thousand Oaks, Ventura County, California

Principal and Project Manager for the Phase I Survey for Cultural Resources. Project included a site visit and SCCIC/NAHC and NHM record searches and an impact assessment report for the 10.97-acre property.

Phase I Survey of the Proposed California Lutheran University, School of Management Building, Thousand Oaks, California (with Samantha Renta)

Principal and Project Manager for this university project. Project included a SCCIC/NAHC record search and a site visit.

Phase II Evaluation of CA-LAN-41 within the Boundary of the Agoura Village project, City of Agoura Hills, Los Angeles County, California

Principal and Project Manager for the completion of an Evaluation Phase II of a complex prehistoric cultural resource within the boundary of the Agoura Village project. The Phase II involved the excavation of ten test units, dozens of shovel test pits, as well as more detailed mapping of the site.

Conrad N. Hilton Foundation Phase Ib of Proposed Phase II Building Locations, Agoura Hills, California

This project involved the excavation of 48 shovel test pits within the western periphery of cultural resource CA-LAN-320 on Foundation property. (Current)

Oakmont Senior Housing Archaeological, Paleontological, and Native American Monitoring Project, Agoura Hills, California

Principal and Project Manager for this archaeological, paleontological, and Native American monitoring project. (Current).

CA-LAN-320 Phased Evaluation Project, Agoura Hills, Los Angeles County, California

Principal and Project Manager for the phased evaluation Phase II of CA-LAN-320 in response to potential impacts from the construction of the Conrad N. Hilton Foundation Phase 2 Campus Building. The site is a prehistoric Chumash residential and ceremonial center of over 80 acres in size and that was used by prehistoric Native Americans from 300 B.C. to the late 1700s. Dozens of test units, hundreds of shovel test pits, surface collection, and surface feature mapping have been completed to date planned. (Current).

Conrad N. Hilton Foundation Geotech Boring Archaeological and Paleontological Monitoring, Agoura Hills, California

This project involved the monitoring of geotech trench and drilling sites within Foundation and Las Virgenes Water District properties within the City of Agoura Hills.

Hilton Property Phase 3 Construction Site Phase Ib Cultural Resources Survey, Agoura Hills, Los Angeles County, California

Principal and Project manager for this extensive preliminary survey project, including excavation of over 200 shovel test pits and 4 test units to define the boundaries of a prehistoric ceremonial site of over 80 acres in size, used by Chumash Native Americans from 400 A.D. to the late 1700s. Recordation of over 190 features and 11,500 artifacts.

Archaeological, Paleontological, and Native American Monitoring for the JPA/Las Virgenes Water District Solar Farm Expansion, Calabasas, California

Principal and Project Manager for this monitoring project. This project encountered elements of a very old prehistoric site at depth, which included lithic material, groundstone artifacts, and an intact multi episodic hearth feature. (Current).

Archaeological and Paleontological Monitoring for the Agoura Landmark Development Project, Agoura Hills, California

Principal and Project Manager for this monitoring project. A negative findings report was also completed and submitted to the City.

Cultural, Paleo, and Native American Monitoring for the Agoura Hills Marriott Development Project, Agoura Hills, California

Principal and Project Manager for this monitoring project. During monitoring, a prehistoric Chumash cultural resource was discovered (number not yet assigned), which led to artifact collection, analysis, and a final report of findings that was submitted to the City

Phase I Survey for the Agoura Kanan Village project, a 7.37 acre Commercial Subdivision in the City of Agoura Hills, Los Angeles County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC scoping, and a Phase Ia site survey. The Phase Ia survey was followed by a Phase Ib subsurface survey and an updated site form for a previously known prehistoric cultural resource that includes the entire project area.

Phase II Evaluation of two cultural resources located on the Oakmont project property, City of Agoura Hills, Los Angeles County, California

Principal and Project Manager for the evaluation of a prehistoric cultural resource and a 1920s 1980s historic homestead cultural resource. Evaluation tasks included shovel test pits, and a test unit for the prehistoric cultural resource, and detailed mapping and documents research for the historic cultural resource. A combined report for both Oakmont projects was produced for the City.

Phase I Survey for the Oakmont commercial project, a 5.75 acre development in the City of Agoura Hills, Los Angeles County, California

Principal and Project Manager for the completion of NAHC record search, and a Phase Ia site survey. The Phase Ia survey identified two cultural resources; a 1920s historic homestead foundation, and a large prehistoric archaeological site.

CA-LAN-320 Project Compliance Plans, and Native American and Lead Agency Consultation, Agoura Hills, Los Angeles County, California

Tasks included the authoring of a cultural resource Treatment and Data Recovery Plan, a cultural resource Management Plan, and a Curation Plan for all artifacts, as well as the organization of meetings with the Chumash Tribal Groups and the Lead Agency.

Phase I Survey for the Massilia Spa Project, Triunfo Canyon, Los Angeles County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC record search request, and a site survey. Project also includes an inventory and initial assessment of over a dozen 1930 through 1990 structures on the property.

Phase I Survey of the Butler Ranch, in Ventura County near west Simi Valley, California

Principal and Project Manager for the completion of a Phase I record search, NAHC record search request, and a site survey of this 332 acre low density residential development project.

North Canyon Ranch 170 acre Residential Subdivision in Simi Valley, Ventura County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search and project area site survey. A key issue for this project was a previously disturbed cultural resource within the project area, the destruction of which needed to be addressed in the final report.

Pepperdine University Campus Life Project: Phase I survey of new Baseball Field development, Los Angeles County, California.

Principal and Project Manager for the addition of the campus baseball field as part of the larger Pepperdine Campus Life housing, facilities, and trail development project.

Pepperdine University Campus Life Project: Debris Basin Excavation Cultural and Paleontological Resource Monitoring, Los Angeles County, California

Principal and Project Manager for cultural resource monitoring of Phase I of the Pepperdine Campus Life housing, facilities, and trail development project.

Phase I Survey of a property on Giles Road, Lake Sherwood, Ventura County, California (with Samantha Renta)

Principal and Project Manager for this project, which included an SCCIC record search and a site visit. Exploration of all rock shelters and cache openings on the property for historic artifacts was part of this project.

Phase I Survey of 6544 Wandermere Road, Malibu, Los Angeles County, California (with Samantha Renta)

Principal and Project Manager for this project, which included an SCCIC record search and a site visit.

Phase I Survey of 5841 Busch Drive, Malibu, Los Angeles County, California (with Samantha Renta)

Principal and Project Manager for this project, which included an SCCIC record search and a site visit.

Phase II Evaluation of CA-LAN 129 and CA-LAN 129a, two prehistoric sites, and CA-LAN 4363H, an early historic site located in Calabasas, California

Principal and Project Manager for the evaluation of these three sites as part of permitting with the Corps of Engineers. The evaluation was written to NRHP/SHPO standards.

Phase I Survey of the West Village Project, Calabasas, California

Principal and Project Manager for this Army Corps of Engineers (ACOE) permitting project. Project included a SCCIC/NAHC/NHM record search and a site visit, as well as SHPO review of the final report.

Phase I Survey of the JPA Solar Farm, Calabasas, Los Angeles County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC record search request, and a site survey for the Los Virgenes Municipal Water District. This 20 acre solar project also addressed a large prehistoric Native American site located next to and partially on the property. Project included Native American consultation with the Lead Agency and the Tatatviam and the recordation of two prehistoric petroglyphs

Phase I Survey for the 17 acre Olivas Park Extension commercial development project in Ventura, Ventura County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC record search request, and a site survey, followed by limited monitoring.

Phase I Survey for the Mulholland Senior Living Project, Los Angeles County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC record search request, and a site survey.

Phase I Survey of the proposed Tapo at Alamo EIR for a mixed use development project, Simi Valley, Ventura County, California (with Samantha Whittington) and Debbie Balam

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC record search request, and a site survey.

Phase I Survey of roughly 50 acres for Improvements on the Saddlerock Ranch/Malibu Wines Property in the Santa Monica Mountains, Los Angeles County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC scoping, and a site survey. This project involves upgrades to the winery existing structures and public buildings, as well as road and parking improvements. Part of this project is located near a National Register Chumash rock art site as well as other prehistoric resources

Phase I Survey for 34134 Mulholland Highway, Los Angeles County, California

Principal and Project Manager for the completion of a SCCIC/NAHC record search, NAHC record search request, and a site survey.

Manzanita School Phase Ia Survey for a 20.27 acre private school development in Topanga Canyon, California, Los Angeles County, California

Principal and Project Manager for the completion of an SCCIC and NAHC record search, and a site survey. This project also assessed built environment resources, which included early 1900s buildings, early 1900s water control features, culverts, and bridges, and 1950s landscaping elements.

Phase I Survey of the Proposed California Lutheran University, School of Management Building, Thousand Oaks, California (with Samantha Renta)

Principal and Project Manager for this university project. Project included a SCCIC/NAHC record search and a site visit.

Construction Energy Worksheets

Construction Electricity Use Worksheet
LAUSD Canoga Park High School Project

Total MT CO2 Emissions by Construction Phase

Phase 1		Construction Equipment	Mobile Worker	Mobile Hauling/Vendor
2025	Demolition	33.40	1.97	24.17
2026	Demolition	35.65	2.05	25.33
2026	Grading	12.12	0.81	3.24
2026	Construction	247.80	28.58	27.50
2026	Paving	93.54	14.7	0.00
2027	Construction	38.19	4.32	4.15
2027	Painting	2.67	1.09	0.00
Subtotals in Metric Tons:		**463.37**	**53.52**	**84.39**
Approximate Gallons of Fuel:		**45,605**	**6,020**	**8,306**

Phase 2		Construction Equipment	Mobile Worker	Mobile Hauling/Vendor
2027	Demolition	35.87	2.03	9.88
2027	Grading	20.21	1.32	3.18
2027	Construction	166.77	2.74	0.00
2028	Construction	84.18	1.36	1.30
2028	Paving	20.63	2.60	0.00
2028	Painting	1.22	0.07	0.00
Subtotals in Metric Tons:		**328.88**	**10.12**	**14.36**
Approximate Gallons of Fuel:		**32,369**	**1,138**	**1,413**

Grand Total Diesel	**87,693**
Grand Total Gasoline	**7,158**

Construction Equipment fuel is diesel fuel.
Mobile Worker fuel (worker trips) is calculated as 100% gasoline fuel.
Mobile Hauling/Vendor fuel is calculated as 100% diesel fuel, although medium-duty trucks comprise 50% of the trips assumed by CalEEMod, which may use gasoline fuel. Assuming 100% diesel use for fuel consumption purposes does not have any effect on analysis.

Conversion of metric tons of CO2 to gallons of diesel: MTCO2/0.01016047
Gallons of gasoline: MTCO2/0.00889041

Derived from 2016 USEIA figures: 1 gallon of diesel produces 22.4 lbs of CO2.

MTCO2 emissions for each phase as reported in CalEEMod "Annual" calculations.

Total MT CO2 Phase 1:	601.28
Total MT CO2 Phase 2:	353.36
Total:	954.64

Construction Fuel Consumption Worksheet
LAUSD Canoga Park High School Project

Water use during construction

Phase 1

	Acres (1)	Gallons Water (2)	Electricity kWh (3)
Total acres graded	9	27,180	144.22
Demolished Structures	1	3,020	16.02
		Subtotal	160.24

Phase 2

	Acres (1)	Water Used (2)	Electricity (3)
Total acres graded	15	45,300	240.36
Demolished Structures	1	3,020	16.02
		Subtotal	256.39
		Total water kWh	**416.63**

Mobile Office Energy Use (4)

	kWh/yr	Years in Use	Total kWh
Mobile Office yearly	3,590.00	4.00	**14,360.00**

Grand Total: **14,776.63** **Kwh**

1) Based on total acres of grading as calculated by CalEEMod. 1 acre is added to represent water used to suppress dust during demolition activities.
2) Water associated with dust control is based on a 3x daily application rate that amounts to 3,020 gal/acre. This rate is not the amount of water used per day while grading but the total cumulative amount of water used per acre graded. Source: Air & Waste Management Association, Air Pollution Engineering Manual (1992 Edition).
3) Each gallon of delivered water for outdoor use in Southern California is associated with 0.005306 kWh of electricity. Source: CalEEMod 2020 Appendix G Table G-32.
4) Assuming the project will employ a mobile office during the entire 4 year construction process. Usage is based upon a 2022 CalEEMod estimate of electricity use for one 1,300 sf "mobile home park" housing unit, calculated to use 3,590 kWh/yr. Actual mobile construction office electricity use would likely be lower

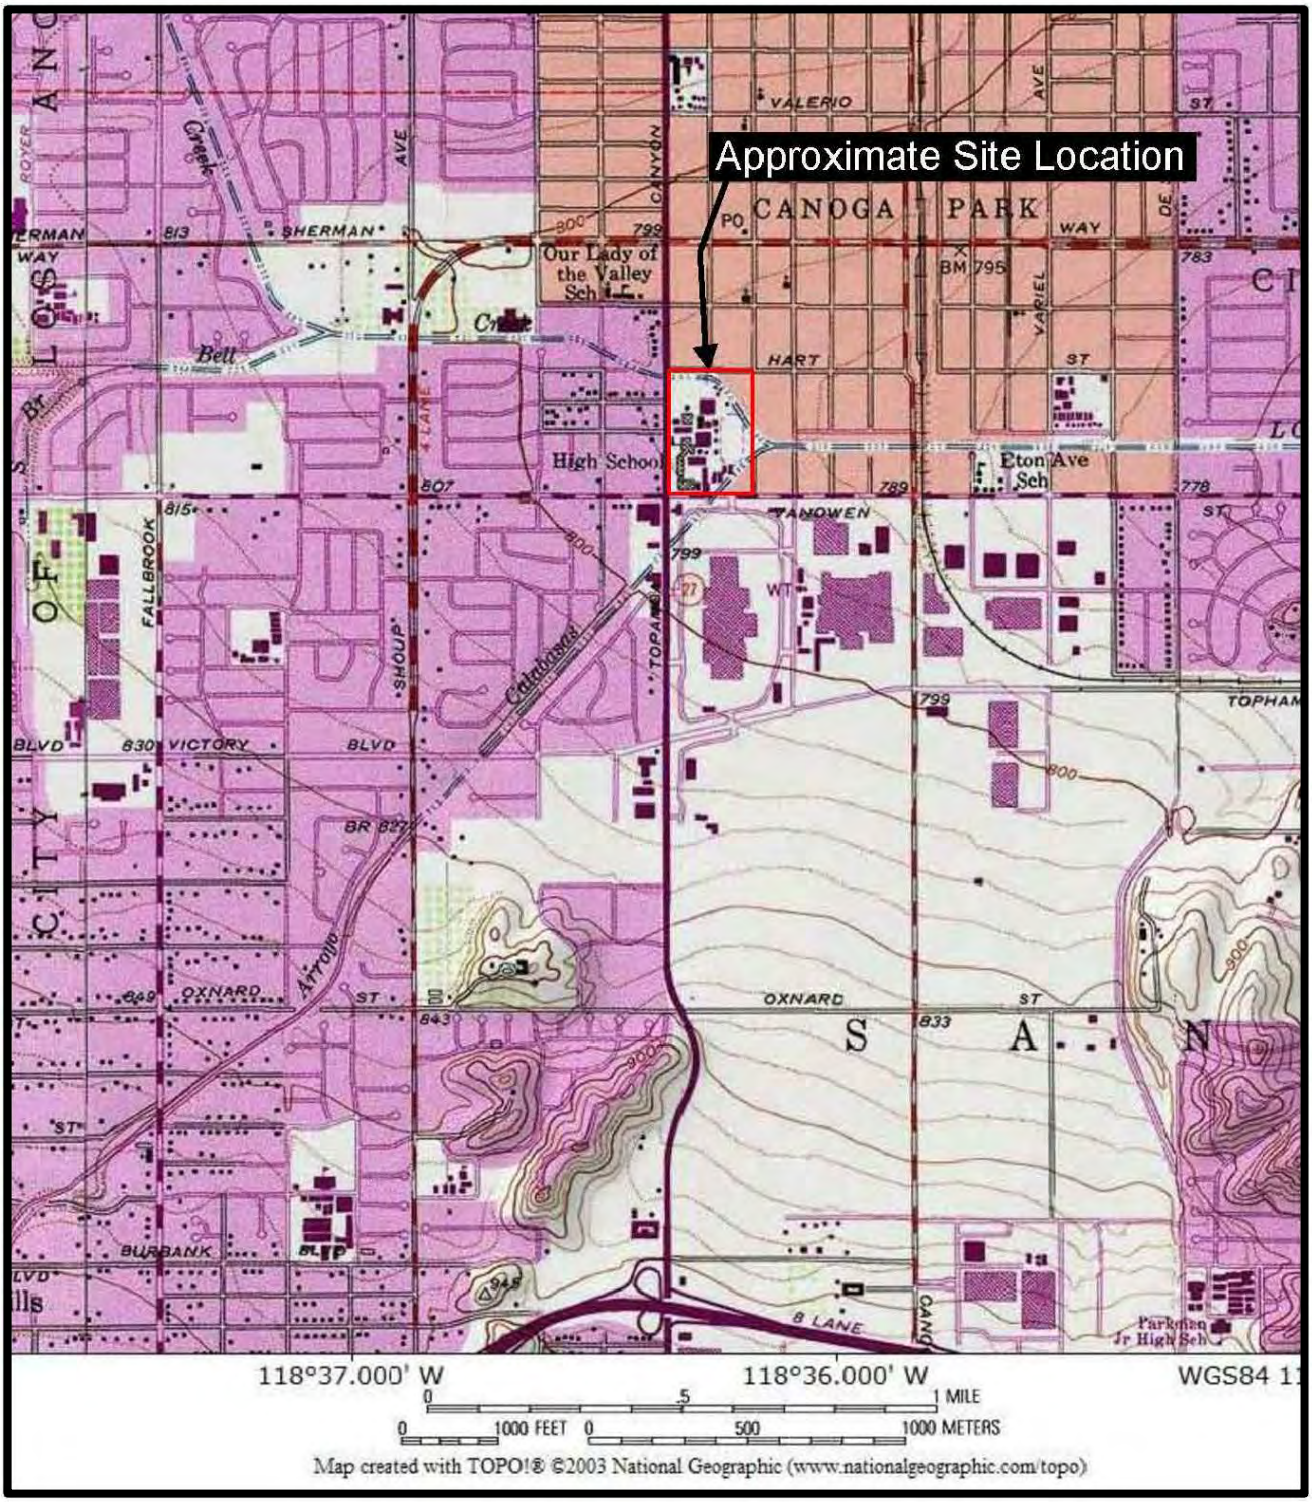
Subject: **Preliminary Geotechnical Evaluation, Canoga Park High School Major Modernization, 6850 Topanga Canyon Boulevard, Canoga Park, California**



1.0 INTRODUCTION

Presented herein are the results of our preliminary geotechnical site evaluation for major modernization at Canoga Park High School at 6850 Topanga Canyon Boulevard, in the Canoga Park area as shown on Figure 1. Modernization may include demolition and construction of new buildings as well as seismic retrofit of some existing buildings.

For the current evaluation six exploratory borings were drilled and six Cone Penetrometer Test (CPT) Soundings were advanced near the locations proposed by Los Angeles Unified School District (LAUSD) personnel and/or their consultants. The approximate locations of our exploratory points are shown on the attached Geotechnical Exploration Map, Plate 1. Also shown are the locations of four prior explorations (Gorian and Associates, Inc. 2019).

The existing school (hereafter, Site) falls within a State of California designated Liquefaction Seismic Hazard Zone (CGS, 1998). To evaluate the potential for seismic settlement, select borings and CPT soundings were extended to a depth of 50 feet as required in California Geological Survey (CGS) Special Publication 117A for the evaluation of seismically induced ground settlement. During our subsurface exploration, groundwater was encountered at depths varying from approximately 17 to 20½ feet below the existing ground surface (bgs). In addition, the historical high groundwater level is shown at roughly 10 feet below the Site (CGS, 1997-rev. 2005).

The subsurface exploration found the area of the school evaluated for this report to be underlay by native soils referred to as alluvial basin or fan deposits (Holocene) locally mantled with artificial fill, grass, and pavement. General descriptions of the materials encountered in the subsurface exploration are presented in the text of this report with boring specific detail presented on the attached Logs of Subsurface Data (Appendix A).

Job No: 2880-83-3-101		Date: May 2022
Scale: 1" = 2000'	Drawn by:	Figure 1
	Approved by:	

The Site was found to have a potential for seismic settlement of 0 to 1-2/3 inch during a design level (2,475-year return period) earthquake as addressed later herein with a potential for differential settlement of ¾ inches. Calculated lateral spread was less than ½ inch. Based on the CGS Special Publication 117A, structural mitigation may be used within this range of seismic induced settlement. Our geotechnical evaluation for the comprehensive modernization project has found that with proper design and construction practices, the Site is suitable for future development/modernization.

2.0 PROPOSED CONSTRUCTION

The proposed major modernization project at Canoga Park High School may include new buildings, retrofit buildings, portable buildings, and modernization of buildings. It is anticipated that buildings will not be more than three stories and will be similar to the existing buildings onsite. Evaluation of existing soil conditions was performed on the main campus and on the other side of both flood control channels (Bell Creek and Calabasas Creek).

3.0 SCOPE OF SERVICES

Our geotechnical evaluation was performed in accordance with generally accepted geotechnical engineering practices under the direction of a state Registered Geotechnical Engineer and Certified Engineering Geologist and included the following:

3.1 ARCHIVAL REVIEW

Pertinent geotechnical data available in our office was reviewed for this report.

3.2 SUBSURFACE EXPLORATION

Recently, six geotechnical borings (B-11 through B-16) were drilled to depths of 31 to 51½ feet below the existing ground surface (bgs) to evaluate the underlying soil conditions. [note: Location 15 has both a CPT sounding and a hollow-stem auger boring]. A subcontractor supplied and operated truck-mounted hollow-stem auger drill rig was used to advance the borings to the indicated depths. Standard Penetration Testing (SPT) of the encountered in-situ earth materials was performed at various depths within the exploratory borings. Additionally, six Cone Penetrometer Test (CPT) Soundings (CPT-15 and CPT-17 through CPT-21) were advanced to depths of approximately 50 feet bgs utilizing a subcontractor supplied and operated cone penetrometer test rig. Shear wave measurements were measured at the bottom of each CPT. Field exploration activities described above were observed by an engineer or geologist from this office, who logged the underlying materials and obtained bulk and relatively undisturbed drive soil samples for laboratory analyses.

Previously, in 2019 four geotechnical borings (B-1 through B-4) were drilled to depths of approximately 16 to 51½ feet bgs utilizing a subcontractor supplied and operated truck-mounted hollow-stem auger drill rig. Field exploration activities described above were observed by a geologist from this office, who logged the underlying materials and obtained bulk and relatively undisturbed drive soil samples for laboratory analyses. In addition, Standard Penetration Testing (SPT) was performed at various depths within the deeper (51± feet bgs) exploratory boring.

Prior to site exploration, the points of exploration were marked in the field and a utility locator subcontractor was contacted to identify the surface trace of detectable underground utilities and abandoned piping in an effort to explore away from subsurface utilities. Additionally, Underground Service Alert (USA) was contacted per State mandated protocol.

At the end of exploration, the borings and CPTs were backfilled with Portland Cement and water and patched with asphalt cold patch in drive areas within existing asphalt, and a grass patch in the

landscaped area. Boring backfills may settle with time and a LAUSD representative should fill any depression that may occur, as necessary.

3.3 LABORATORY TESTING

A program of geotechnical laboratory testing was performed to evaluate properties of selected soil samples obtained during the subsurface exploration. The following tests were conducted for this preliminary site evaluation:

- Moisture and Density Testing of Undisturbed Soil Samples
- Maximum Density and Optimum Moisture Content Relationships
- Direct Shear Testing
- Consolidation Testing
- Atterberg Limits
- Expansion Index Testing
- Hydrometer Analyses
- Corrosivity Analyses
- R-Value Testing

3.4 GEOTECHNICAL ENGINEERING ANALYSIS AND REPORT PREPARATION

This report was prepared to present the results of our archival research, field subsurface exploration and laboratory testing programs, and engineering analyses including the findings, conclusions, and recommendations of our geotechnical site evaluation. The report includes:

a) A description of subsurface conditions as encountered in the exploratory excavations, including Logs of Subsurface Data and Cone Penetration Test Data (Appendix A), Geotechnical Exploration Map (Plate 1), and Geotechnical Cross Section (Plate 2).

b) A description of the laboratory testing program, including test results (Appendix B).

c) Discussion and recommendations regarding:

- Geologic hazards including seismic setting of the site and faulting;
- Seismic design criteria for new and retrofit/modernization buildings;
- Seismic Design Parameters from ASCE 41-17 and ASCE 7-16;
- Site Specific MCE_R Response Spectra;
- Liquefaction and Seismically Induced Settlement and Lateral Spread (Appendix C);
- Soil collapse and expansion potential;
- Site preparation and remedial grading;
- Foundation design recommendations including shallow, mat, and flagpole foundations;
- Shoring recommendations;
- Estimated settlements;
- Percolation feasibility, based on soil characteristics;
- Retaining wall design parameters (restrained and cantilever walls) and earthquake loading;
- Preliminary pavement and hardscape design; and
- Soil chemistry analysis, by subcontract.

4.0 SITE DESCRIPTION

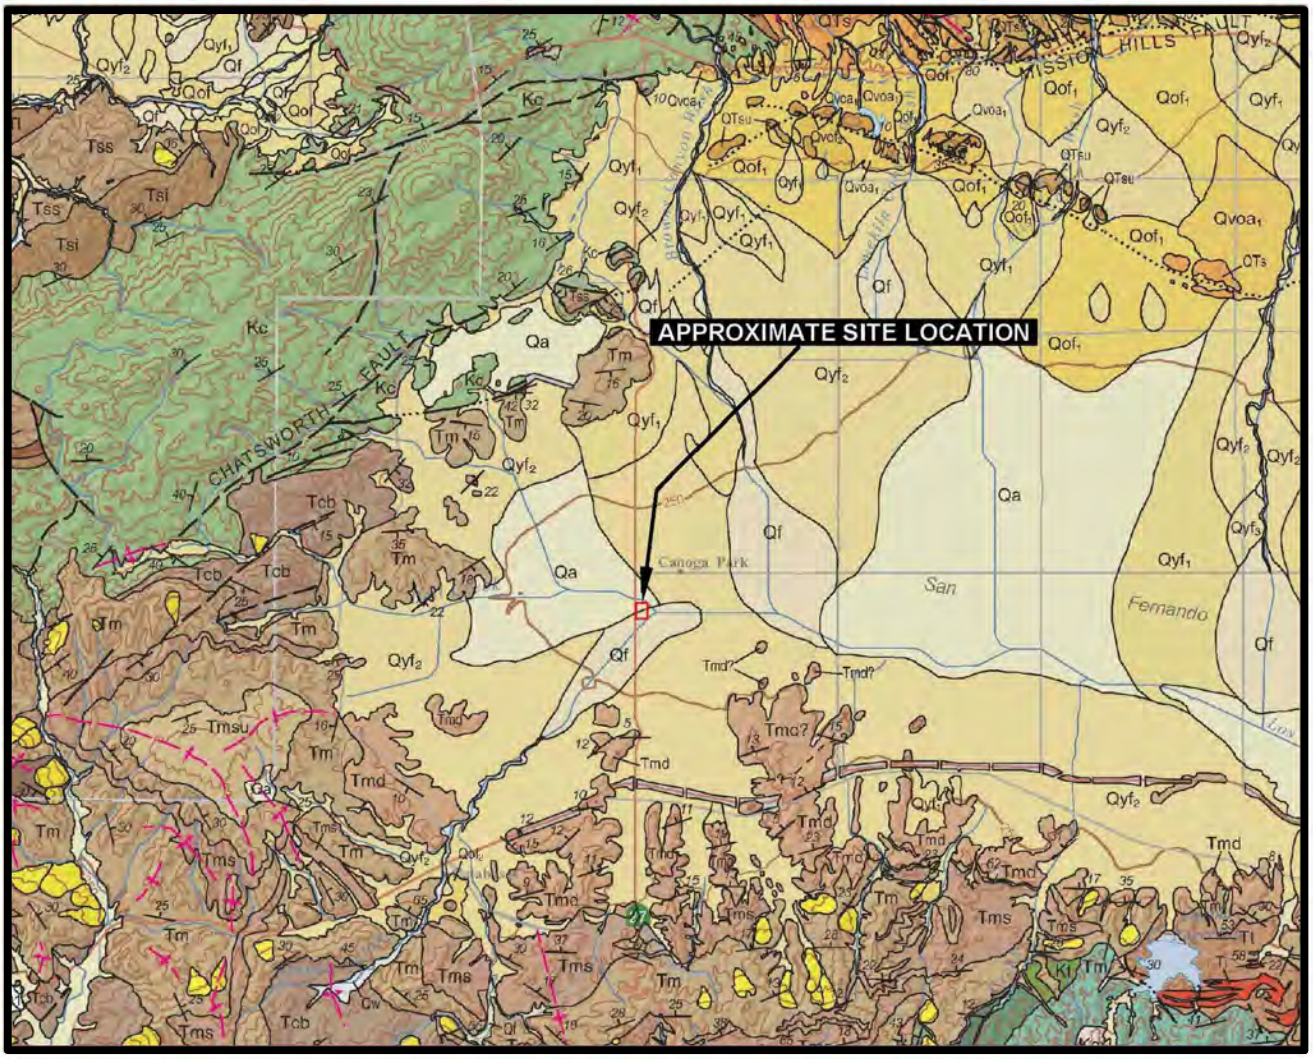
Canoga Park High School is on a relatively flat, roughly rectangular parcel bounded on the north by Hart Street, on the west by Topanga Canyon Boulevard, on the south by Vanowen Street, and on the east by Jordan Street. The Bell Creek Flood Control Channel and the Arroyo Calabasas (Calabasas Flood Control Channel) bisect the northeast and southeast portions of the site, respectively. Portable Classroom buildings are located across Bell Creek and agricultural greenhouses are located across Arroyo Calabasas. Both channels have footbridges for crossing within the school property. The main parking lot is in the southwest portion of the site, with faculty parking east of that. The stadium is in the eastern portion of the site between the two flood control channels with the gymnasium, basketball courts and grass baseball field in the northwest portion of the site. Grass and landscaping are present in the front of the school along Topanga Canyon and scattered between the buildings both directly adjacent to some buildings as well as in separated planters. The topography slopes gently to the south. The site is surrounded by existing residential and commercial development.

Construction began at Canoga Park High School (formerly Owensmouth High School) circa 1924. Since that time, construction has continued with buildings being added, removed and/or repurposed. In general, it appears the foundations are on the order of 3 to 4 feet below adjacent grade and some fill was placed below the slabs.

4.1 REGIONAL GEOLOGIC SETTING

The Site is in the southwestern portion of the San Fernando Valley, an east trending structural trough within the Transverse Ranges geomorphic province of Southern California. This geomorphic province is dominated by active compressional tectonics (crustal shortening) and is characterized by east west trending ranges and ridges with intervening canyons and valleys. The San Fernando Valley has been filled from the sides with sediments from drainages of the San Gabriel Mountains (mainly) and Santa Susana Mountains to the north, the Santa Monica Mountains to the south, and the Simi Hills and Verdugo Mountains to the west and east, respectively. Being on the southwestern portion of the Valley, the Site is on a broad apron of alluvial fans deposited at the mouths of drainages of the Santa Monica Mountains south of the site as well as basin alluvium (see Figure 2).

4.2 SITE GEOLOGIC UNITS



The Site is underlain by native soils referred to as alluvial / alluvial fan deposits (Holocene) locally mantled with artificial fill, grass, and pavement. General descriptions of the pavement, artificial fill, and alluvial fan (alluvium on boring logs) as encountered in our exploratory borings are presented below with boring specific detail presented on the attached Logs of Subsurface Data (Appendix A).

4.2.1 Pavements

Asphaltic concrete pavement was encountered in borings B-1, B-3, B-4, B-12, and B-15 and is underlain by fill or native soils. The encountered asphaltic concrete varied in thickness from 2½ to 3½ inches in pedestrian traffic areas and 5 to 8½ inches in vehicle traffic areas.

4.2.2 Artificial Fill

Artificial fill was not identified in the current borings, although thin, shallow fill deposits may have been present in a few of the CPTs. During the previous evaluation, fill soils were encountered in borings B-1 through B-4 to depths of 1½ feet near the Dance Studio and 2½ feet around the Assembly Building. The fill generally consists of clayey sand or silty clay in a damp to very moist and loose to very stiff condition. Given the developed nature of the Site other areas of fill are likely to exist.

Geologic Explanation

Qa = Alluvium (late Holocene) - Unconsolidated gravel, sand, and silt in active or recently active floodplains, locally including related alluvial fans and streambeds where those are not mapped separately; chiefly stream deposited, but includes some debris-flow deposits. Locally corresponds with or encompasses areas of historic flooding, including deposits behind flood-control structures.

Qf = Alluvial fan (Holocene) - Unconsolidated bouldery, cobbly, gravelly, sandy, or silty alluvial deposits on active or recently active alluvial fans and in some connected headward channel segments.

Qyf_2 = Young alluvial-fan deposits, Unit 2 (Holocene to late Pleistocene) - Older young fan deposits, older than Unit 3, younger than Unit 1.

4.2.3 Alluvial / Alluvial Fan Deposits

Beneath the pavement, grass, or artificial fill, alluvial / alluvial fan deposits were encountered to the maximum depth explored of 51½ feet bgs. In general, the site soils consist of silty and sandy clays with isolated layers of silty sands and clayey sands. The upper approximately 15 to 42 feet consist of clay soils, with borings B-11 and B-14 only extending to 31 feet and encountering only clay soils. The clay soils are stiff to hard and damp to very moist above groundwater and very moist to saturated below the encountered groundwater. Below the silty and sandy clay are thin, approximately 1 to 3½ feet of silty or clayey sands interlayered with clay soils. The sands are generally very moist to saturated and medium dense.

4.3 GROUNDWATER

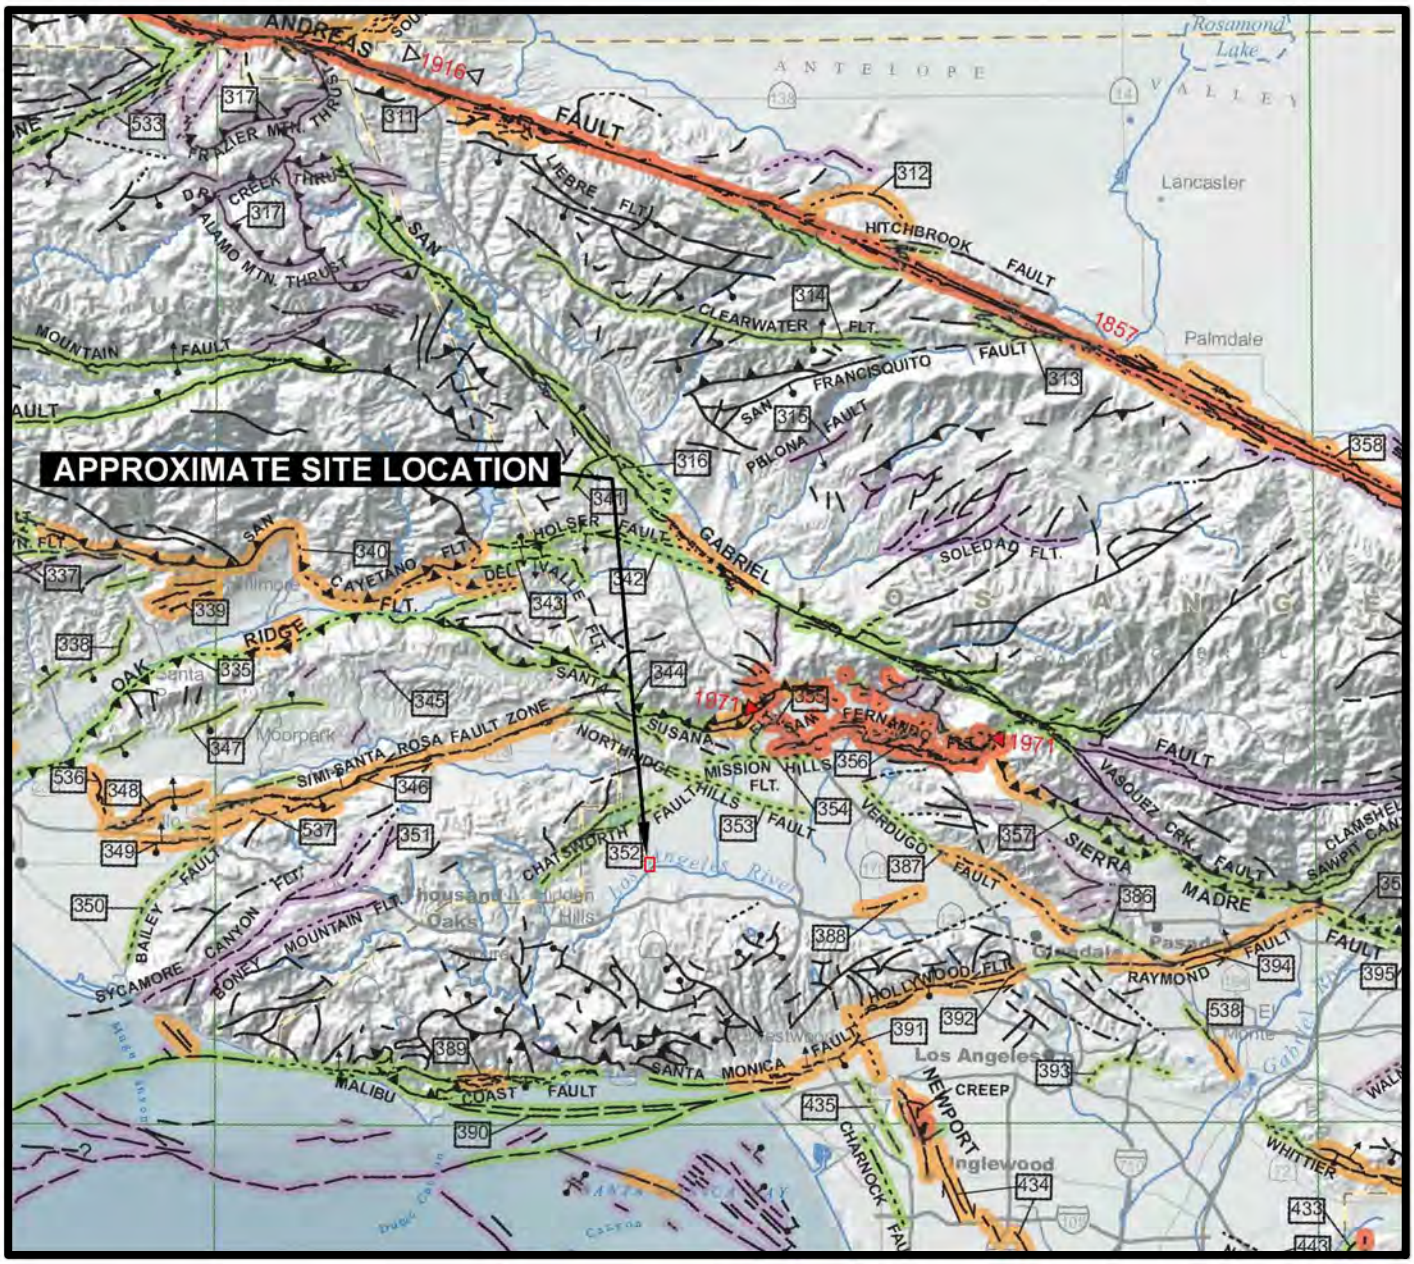
Groundwater was encountered at 17 to 20½ feet bgs in the geotechnical borings and CPTs; during the previous investigation groundwater was encountered at 19 feet. Historic high groundwater for the school site is approximately 10 feet bgs (CGS, 2000 rev. 2012).

4.4 LANDSLIDES

No landslides are present within or near the site nor are any shown on regional geologic maps.

4.5 FLOOD HAZARD ZONE

The Site is not in a Federal Emergency Management Agency (FEMA) mapped flood hazard zone (FEMA FIRM Map, 2008). In addition, it is not in a dam or tsunami inundation zone (City of Los Angeles Department of City Planning, 1996).



4.6 FAULTING AND SEISMICITY

Canoga Park High School, like other sites in the San Fernando Valley, is in a seismically active region prone to occasional damaging earthquakes. The destructive power of earthquakes can be grouped into fault-rupture, ground shaking (strong motion), and secondary effects of ground shaking (such as tsunami, liquefaction, settlement, landslides). The hazard of fault-rupture is generally thought to be associated with a relatively narrow zone along well-defined pre-existing active or potentially active faults. No doubt there are and will be exceptions to this, because it is not possible to predict the precise location of a new fault where none existed before (CDMG, 1975).

Holocene-active faults are not known to cross the Site and the Site is not currently within an Alquist-Priolo (A-P) Earthquake Fault Zone as defined by the State Geologist (CGS 2018).

The closest Historically-active surface fault is the San Fernando fault which ruptured February 9, 1971 and is approximately 9 miles northeast of the Site. The Holocene-active Simi-Santa Rosa Fault zone is approximately 9 miles northwest of the Site. The active Hollywood fault, part of the Santa Monica-Hollywood-Raymond fault system lies approximately 13½ miles southeast of the Site and the active Verdugo fault is approximately 15 miles east of the Site (see Figure 3). The potential for ground rupture on site due to faulting during the life expectancy of the project is considered remote.

Although no Holocene-active faults are known to exist on or in close proximity to the Site, the area will be subject to strong ground motion from occasional earthquakes in the region. Four significant earthquakes have occurred centered within 40 miles of the Site within the last eight decades; the March 11, 1933 Long Beach earthquake (6.4 magnitude), the February 9, 1971 San Fernando earthquake (6.6 magnitude) with its epicenter about 18½ miles northeast of the Site, the October 1, 1987 Whittier Narrows earthquake (6.0 magnitude), and the January 17, 1994 Northridge earthquake (6.7 magnitude) with its epicenter located approximately 4 miles northeast of the Site.

Geologic Time Scale			Years Before Present (Approx.)	Fault Symbol	Recency of Movement	DESCRIPTION	
						ON LAND	OFFSHORE
Quaternary	Late Quaternary	Historic				Displacement during historic time (e.g. San Andreas fault 1906). Includes areas of known fault creep.	
		Holocene	200			Displacement during Holocene time.	Fault offsets seafloor sediments or strata of Holocene age.
		Pleistocene	11,700			Faults showing evidence of displacement during late Quaternary time.	Fault cuts strata of Late Pleistocene age.
	Early Quaternary		700,000			Undivided Quaternary faults - most faults in this category show evidence of displacement during the last 1,600,000 years; possible exceptions are faults which displace rocks of undifferentiated Plio-Pleistocene age.	Fault cuts strata of Quaternary age.
Pre-Quaternary			1,600,000*			Faults without recognized Quaternary displacement or showing evidence of no displacement during Quaternary time. Not necessarily inactive.	Fault cuts strata of Pliocene or older age.
			4.5 billion

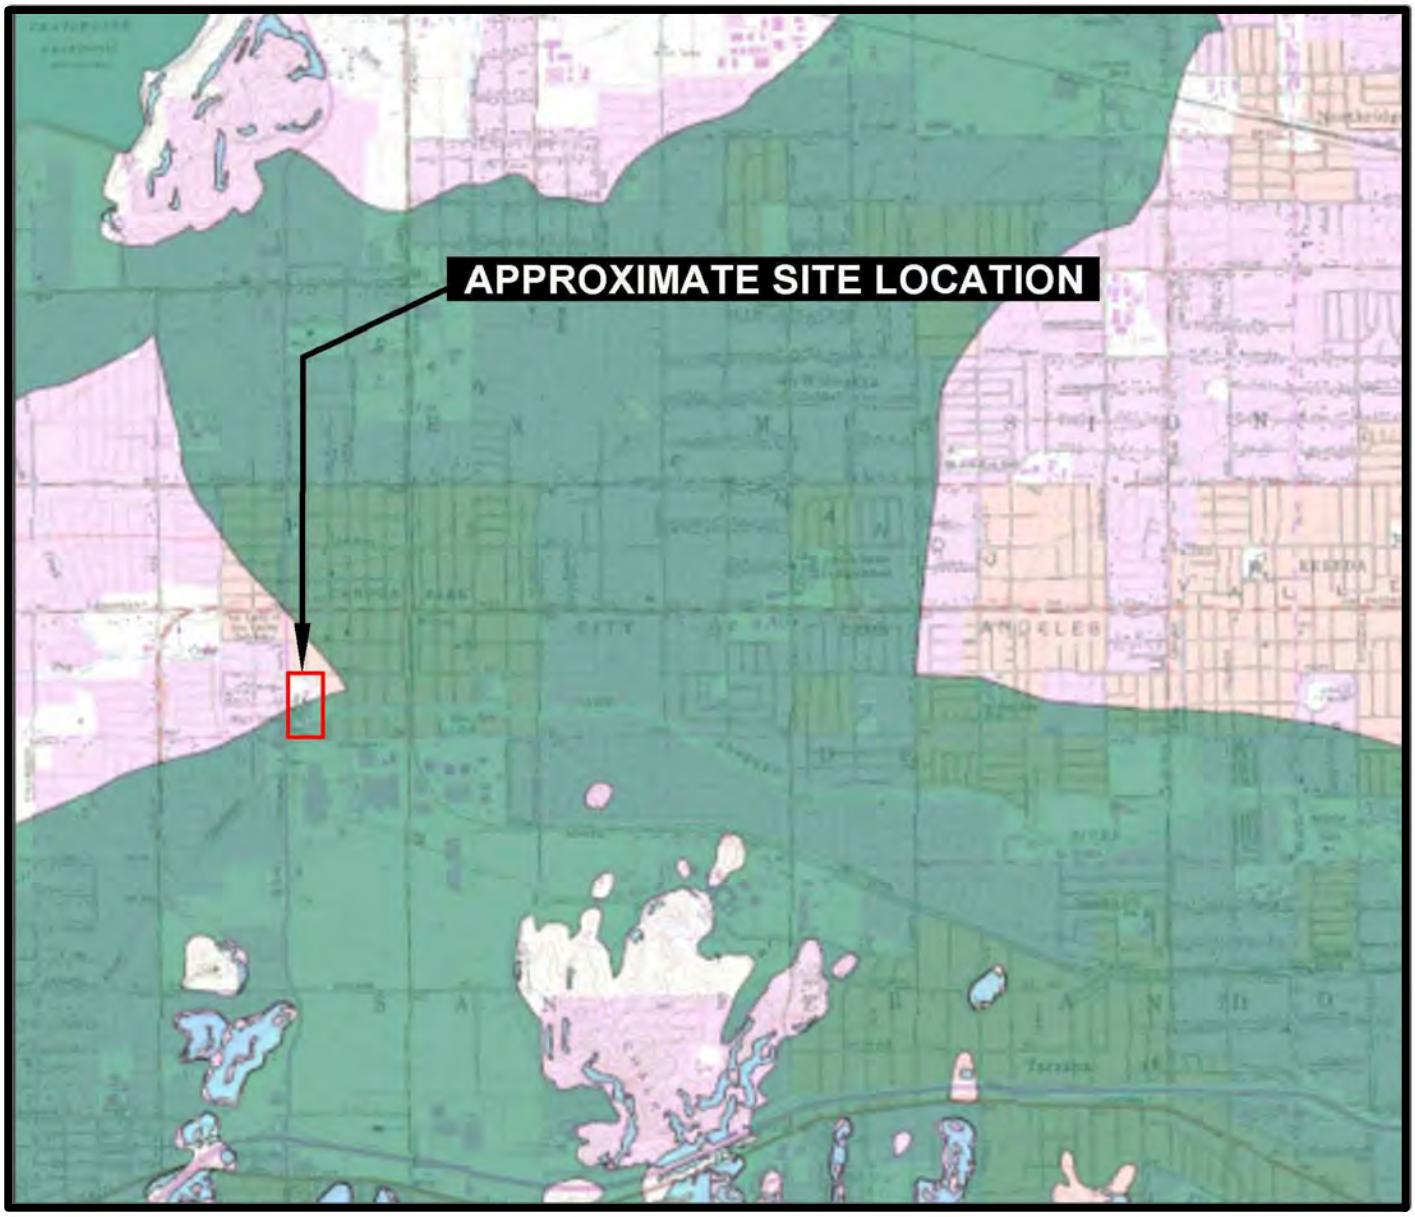
Scale: 1" = 10 mi	Drawn by:	Figure 3
	Approved by:	

It is estimated during the Northridge event, the general area of the school experienced maximum horizontal accelerations on the order of 0.45g on the alluvial soil site condition. This is based upon ground motion data obtained from ground motion contours presented in Chapter 3 of the *Preliminary Report on the Principal Geotechnical Aspects of the January 17, 1994 Northridge Earthquake* (Chang et al., 1994). Significant earthquakes will likely occur in this area within the life expectancy of the project and the site will experience strong ground shaking from these events.

Based on the latest U.S. Geological Survey (USGS) interactive web application, *Unified Hazard Tool* <https://earthquake.usgs.gov/hazards/interactive/> probabilistic seismic hazard analyses (PSHA) predict the Design Basis Earthquake (475-year return period) peak horizontal ground acceleration will be on the order of 0.52g for the alluvial soil conditions of the Site D (average V_S=722 ft/sec). The mean magnitude from this PSHA is 6.5(Mw) with a mean distance of 14.13 km from the property. Utilizing a 2% probability of exceedance in 50 years (2,475-year return period) the peak ground acceleration is estimated to be 0.85g based on a seismic event with a mean magnitude of 6.51(Mw) at a mean distance of 11.04 km. The modal magnitude from this analysis is 6.3(Mw) and the modal distance is 11.02 km from the property. Additional seismic data is presented in later sections and in Appendix C.



Secondary effects of strong ground motion include Tsunami, seiche, liquefaction, settlement, landslides, etc. Tsunami (seismic sea wave and seiche (standing wave) are not hazards inherent to the site due to its distant proximity to the ocean and any large bodies of water. Likewise, seismically induced landsliding is not a hazard inherent to the relatively flat site. Earthquake induced liquefaction and seismic settlement affecting the proposed site development are discussed below.

4.7 LIQUEFACTION/DRY SAND SETTLEMENT POTENTIAL

Liquefaction is a seismic phenomenon in which saturated cohesionless soils (sands and non-plastic silts) lose strength when severely shaken during an earthquake and develop excess water pore pressures. As stated in the CDMG (1997) report, “In order to be susceptible to liquefaction, potentially liquefiable soils should be saturated or nearly saturated. In general, liquefaction hazards are most severe in the upper 50 feet of the surface…”. Dry sand settlement or seismic settlement is the dynamic compaction due to seismic shaking of dry, loose, sandy soils with little to no cohesion.

The Site is in an area zoned by the State as being susceptible to liquefaction (CGS, 1998, see Figure 4). A seismic settlement analyses was performed using the computer program GeoSuite Liquefaction. For liquefaction/seismic settlement evaluations, the 2019 CBC / ASCE/SEI 7-16 designates a ground motion with a 2% chance of being exceeded in 50 years (2475 return period) be utilized in the analyses. The site modified peak ground acceleration (PGA_M) in accordance with ASCE 7-16 is 0.648g. The ASCE 7-16 parameters were utilized in our current seismically induced settlement analyses (including recent and previous exploration points) and yielded seismically induced settlement on the order of 0 to 1-2/3 inches; see Appendix C. Settlement can be separated into dry sand settlement of 0 to ¼ inch and liquefaction settlement of 0 to 1-2/3 inches.

Differential seismic settlement is typically anticipated to be one-half of the total seismic settlement. Based on the estimated seismic settlement at the surface, and the uniformity thereof, the estimated differential seismic settlement will be on the order of ½ to ¾ inch across 30 feet. The analyses were conducted using CPT sounding data and SPT data from the truck mounted hollow-stem auger borings. The SPT tests were performed using a 140-pound automatic trip hammer dropped 30 inches. The SPT sampler, machined for a liner, did not have a liner during testing. Field N-value blow counts were normalized to 1 ton/square foot and corrected for the rig efficiency, hammer type, sampler type (no liner), rod length, and fines content (where applicable) as described in the Recommended Procedures for Implementation of CDMG Special Publication 117 (SCEC 1999).

SEISMIC HAZARD ZONES

Liquefaction Zones
Areas where historical occurrence of liquefaction, or local geological, geotechnical and ground water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

SEISMIC HAZARDS MAP

Canoga Park High School
6850 Topanga Canyon Blvd.
Canoga Park, California

Gorian & Associates, Inc.
Applied Earth Sciences

Job No: 2880-83-3-101		Date: May 2022
Scale: 1" = 5000'	Drawn by:	Figure 4
	Approved by:	

Potential lateral spread was calculated using Youd, Hansen, and Bartlett for the CPTs closest to the Bell Creek and Arroyo Calabasas Los Angeles County Flood Control Channels. The channels were assumed to be 15 feet deep. Boring B-13, B-16, CPT-17, CPT-20, and CPT-21 when subjected to the 2,475-year return period event yielded lateral spread of less than ¼ to ½ inch toward the channels.

4.8 CORRELATION CPT AND BORING

Boring B-15 and CPT-15 were excavated in the same general area. The subsurface profile for both explorations consisted generally of clay materials with scattered silty sand to sandy silt layers. In B-15 the sandier layers were encountered from 19½ to 23 feet and 28½ to 29½ feet bgs. In CPT-15 the sandier layers were encountered from 19 to 19½ feet and 41½ to 42½ feet bgs. Groundwater was encountered at 18½ feet in the boring and 19 feet in the CPT. The calculated seismic settlement was 0.69 in the boring and 0.14 in the CPT. This is likely due to the thicker layer assumed in the boring due to discrete sampling rather than continuous logging in the CPT.

4.9 HYDRO-COLLAPSE

Based on the cohesive and expansive nature of the onsite soils and consolidation testing, soils at the site are not susceptible to hydro-collapse.

5.0 GEOTECHNICAL CONCLUSIONS AND RECOMMENDATIONS

From a geotechnical standpoint, our geotechnical evaluation for the comprehensive modernization project has found that with proper design and construction practices, the Site is suitable for future development/modernization. Geotechnical recommendations presented in the following sections of this report should be incorporated into the design and construction of the project. Recommendations concerning site preparation, grading and foundations are provided in the following sections. The presence of existing improvements adjacent the construction areas should be considered during all design and construction activities.

5.1 SOIL EXPANSIVENESS

Soil expansion tests were performed on three representative soil samples from the current evaluation to supplement the two previous expansion tests at the site. Test results indicate the underlying near surface materials have a low to medium to high expansion potential, in the 21-50, 51-90, and 91-130 Expansion Index ranges.

Expansive soils contain clay particles that change in volume (shrink or swell) due to a change in the soil moisture content. The amount of volume change depends upon the soil swell potential (amount of expansive clay in the soil), availability of water to the soil, and the soil confining pressure. Swelling occurs when soils containing clay become wet due to excessive water from poor surface drainage, over-irrigation of lawns and planters, and sprinkler or plumbing leaks. Swelling clay soils can cause distress to structures, walks, drains, and patio slabs.

Swelling clay soils can cause distress to construction (generally as uplift). Construction on expansive soil has an inherent risk that should be acknowledged and understood by the developer/property owner. The geotechnical recommendations presented herein are intended to reduce the potential for expansive soil action. However, these recommendations are not intended, nor designed to provide complete and full mitigation of expansive soil conditions. The following should be maintained within the site.

a) Positive drainage should be continuously maintained away from structures and slopes. Ponding or trapping of water in localized areas near the foundations can cause differential moisture levels in subsurface soils. Plumbing leaks should be immediately repaired so that the subgrade soils underlying the structure do not become saturated.

b) Trees and large shrubbery should not be planted where roots can grow under foundations and flatwork when they mature.

c) Landscape watering should be held to a minimum; however, landscaped areas should be maintained in a uniformly moist condition and not allowed to dry-out. During extreme hot and dry periods, adequate watering should be provided to keep soil from separating or pulling back from the foundations.

5.2 SOIL CORROSIVITY

Five samples of on-site soils from the current evaluation were obtained and sent to Project X for soil chemistry analyses. Their report, attached in Appendix B-1, indicate the corrosion class of concrete in contact with the onsite soils is moderate to severe for sulfate and chloride exposure. Additionally, the onsite soils are corrosive to very corrosive to ferrous metals and corrosive to copper piping. See Appendix B-1 for recommendations.

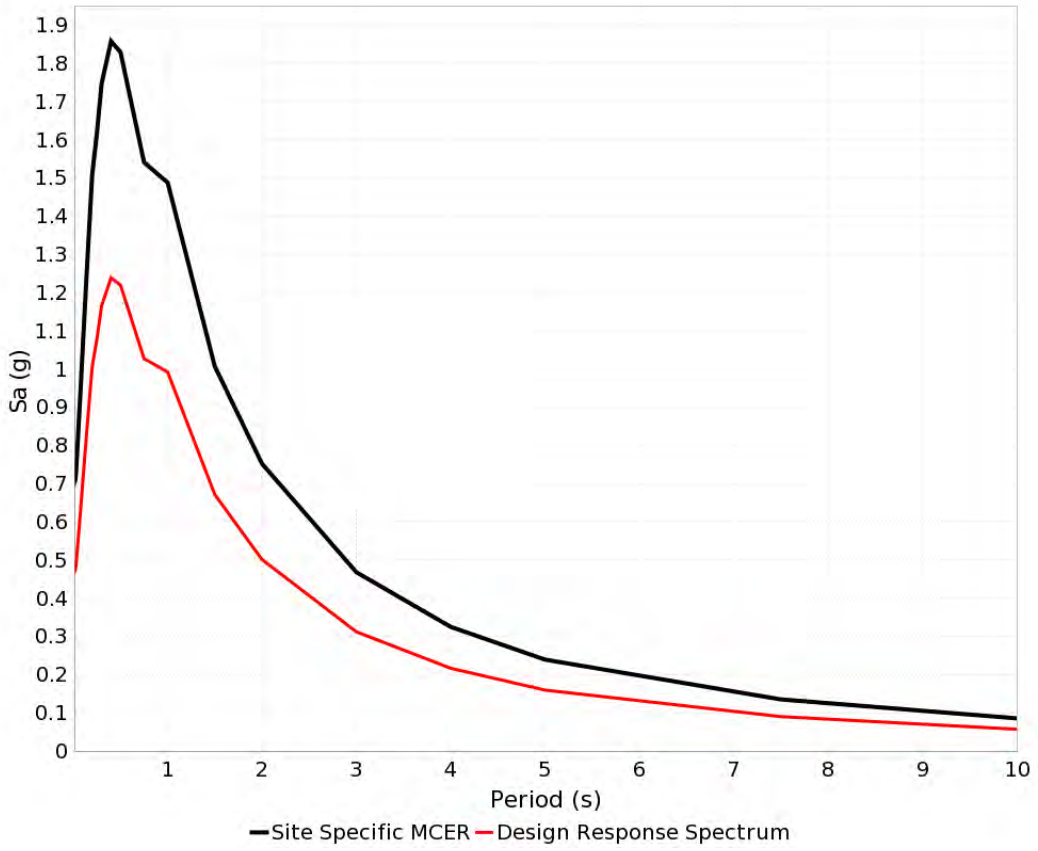
5.3 GEOTECHNICAL SEISMIC DESIGN

The Site may experience strong ground shaking from seismic events generated on regionally active faults. Seismic ground motion parameters were evaluated using a simplified code-based approach and ground motion procedures for seismic design. The simplified code-based approach follows the procedures in ASCE/SEI 7-16 Section 11.4. Retrofit values were obtained from ASCE 41-17 using the standard of BSE-1E, BSE-2E, BSE-1N, and BSE-2N. The results are presented below and in Appendix C.

Seismic ground motion values based on ASCE/SEI 7-16 are adjusted to obtain the maximum considered earthquake (MCE) spectral acceleration values for the Site based on its site class of D. The seismic design parameters for the Site's coordinates (latitude 34.1955° North and longitude 118.6045° West) were obtained from the SEAOCC and OSHPD website that interfaces with and queries the U.S. Geological Survey (USGS) web servers to retrieve seismic design variables. https://seismicmaps.org.

Seismic Parameters based on ASCE/SEI 7-16

SEISMIC PARAMETER	VALUE PER ASCE/SEI 7-16
MCE_R ground motion (for 0.2 second period), S_s	1.5g
MCE_R ground motion (for 1.0 second period), S_1	0.6g
Site Class Definition	D
Site amplification factor at 0.2 second, F_a	1.0
Site amplification factor at 1.0 second, F_v	1.7*
Site-modified spectral acceleration value, $S_{MS} = F_a S_s$	1.5g
Site-modified spectral acceleration value, $S_{M1} = F_v S_1$	1.02*
Numeric seismic design value at 0.2 second, $S_{DS} = 2/3 S_{MS}$	1g
Numeric seismic design value at 1.0 second, $S_{D1} = 2/3 S_{M1}$	0.68*
Site amplification factor at PGA, F_{PGA}	1.1
Site Modified peak ground acceleration, PGA_M	0.648g
*The code-based values presented in the table above may be used in lieu of performing a ground motion hazard analysis only if the exceptions outlined in ASCE/SEI 7-16 Section 11.4.8 are followed.	



Seismic Parameters based on ASCE 41-17 Retrofit Standard, BSE

SEISMIC PARAMETER	VALUE BSE-1E	VALUE BSE-2E	VALUE BSE-1N	VALUE BSE-2N
Spectral response (0.2 s), S_S	0.756g	1.413g		1.5g
Spectral response (1.0 s), S_1	0.243g	0.488g		0.6g
Site Class Definition	D			
Site-Modified spectral response (0.2 s), S_{XS}	0.906g	1.413g	1g	1.5g
Site-Modified spectral response (1.0 s), S_{X1}	0.513g	0.884g	0.68g	1.02g
Site amplification factor (0.2 s), F_a	1.197	1		1
Site amplification factor (1.0 s), F_v	2.114	1.812		1.7

The purpose of the building code earthquake provisions is primarily to safeguard against major structural failures and loss of life, not to limit damage nor maintain function. Therefore, values provided in the building code should be considered minimum design values and should be used with the understanding site acceleration could be higher than addressed by code-based parameters. Cracking of walls and possible structural damage should be anticipated in a significant seismic event.

5.4 SITE-SPECIFIC MCE_R RESPONSE SPECTRA

A site-specific MCE_R Response Spectra was computed using the UGMS MCE_R tool developed by the Southern California Earthquake Center [SCEC] Committee for Utilization of Ground Motion Simulations (UGMS). An average V_{S30} value of 220 m/s was obtained from the CPT soundings. Presented below is the MCE_R Response Spectra. The output is provided in Appendix C.

5.5 INFILTRATION FEASIBILITY

As discussed above the upper soils and generally most of the soils at depth are clay soils. Hydrometer analyses and Atterberg Limit tests were further used to evaluate the soils. Based on the predominant clay soils present at the site, infiltration is considered to have a low feasibility.

5.6 SITE PREPARATION

Areas of new construction will require site preparation prior to foundation excavation or slab subgrade preparation. The following preliminary site preparation and grading recommendations are for the preparation of areas for construction of new buildings, retrofit buildings, and other exterior site improvements. These recommendations should be reviewed when more detailed plans are available for the modernization of the school.

The presence of the existing buildings should be considered during all design and construction activities. Care should be taken to protect existing foundations and their supporting soils at all times. All aspects of grading including site preparation, grading, and fill placement should be per the applicable Building Code.

5.6.1 Site Cleanup

Existing paving, debris, structures, etc. that are not a part of the final product should be removed from the construction area. Debris generated from the demolition should be hauled away. The exposed ground surface should be observed and tested by a field representative of this office to evaluate the consistency and similarity of the soils which will provide construction support.

5.6.2 Soil Removals

The soils below new buildings, or additions to existing buildings, and 5 horizontal feet beyond, as well as any non-engineered fill soils, where encountered, should be removed to firm in-place native soils. In addition, within the footprint of the structures and to a minimum distance of five feet beyond, at least three feet of newly compacted soils should be provided below shallow foundations. Where deep foundations (piles) are proposed, existing fill should be removed, where encountered, and a minimum of two feet of newly compacted fill soils should be provided for slab support.

In areas of paving, a minimum of two feet of newly compacted fill should be provided. Existing fill soils, where encountered, should be evaluated prior to placing new fill soils.

In areas of new retaining walls, a minimum of two feet of newly compacted fill should be provided below shallow foundations. Fill should be extended beyond the outside edge of the footings a horizontal distance equal to the depth of removal or five feet, whichever is greater. Existing fill soils, where encountered, should be evaluated prior to placing new fill soils.

Due to possible variations in the subsurface materials, local areas of deeper removals may be necessary. After these removals are completed as addressed above, the exposed ground surface should be observed by a field representative of this office to evaluate if it is suitable for placement of certified fill. Fill soils should not be placed until completion of the geotechnical observation.

Removals adjacent existing structures with shallow footings, if any, should not extend below a 2(horizontal):1(vertical) line extending down from the bottom of the footing or may need to be performed in slots to protect the existing foundations. Removals adjacent existing footings, as they are being made, and removal bottoms should be observed by a representative of this office.

The supporting soil for a new footing should be observed and recommendations for further removal, if necessary, will be made at that time.

Soil removal within existing buildings to be improved should be based on observations by a representative of this office of the existing soil conditions after being exposed by the general contractor. At this time, no significant soil removals are anticipated within existing buildings to be improved.

If soil removals are necessary within an existing building, removals within areas to receive fill or to provide support for the structure should expose competent materials (minimum 90 percent relative compaction). Removals adjacent existing structure footings should not extend below a 2(horizontal):1(vertical) line extending down from the bottom of the footing or may need to be performed in slots to protect the existing foundations. Removal bottoms should be observed by a representative of this office. In addition, removals adjacent footings should be observed by a representative of this office as the removals are made. The supporting soil for the new footing should be observed and recommendations for further removal, if necessary, will be made at that time.

5.6.3 In-Place Soil Processing

Following removals, the underlying 6 to 8 inches should be scarified, moisture conditioned to slightly above the optimum moisture content, and recompacted to at least 90% relative compaction.

5.6.4 Fill Placement

On-site soils may be reused as fill soils providing the soils are free of major vegetation, trash, and debris. Rocks greater than 6 inches in diameter (or smallest dimension) should be excluded from all fills placed. Suitable fill soils should be placed in thin (6 to 8 inch maximum) lifts, brought to above optimum moisture content, and compacted to at least 90% relative compaction.

5.6.5 Relative Compaction

Relative Compaction is the ratio of in-place dry soil density to the maximum dry soil density determined in general conformance with ASTM test method D 1557.

5.6.6 Temporary Excavations

During construction, the contractor is responsible for the excavation and maintenance of safe and stable slope angles considering the subsurface conditions and methods of operations. Temporary excavations should be made per the applicable requirements of the current Cal/OSHA excavation regulations. Geotechnical evaluation of temporary excavations can be provided when the excavation location is known.

Shallow excavations for construction made in cohesive properly engineered fill or firm natural soils should stand with vertical sides to a depth of 4 feet. Temporary slopes, above groundwater, to a maximum height of 15 feet may be constructed at a maximum 1(horizontal):1(vertical) gradient. Surcharge loading, such as construction supplies or equipment or vehicle traffic, should be kept away from the top of slope 10 feet or the depth of excavation, whichever is more.

5.7 SHORING RECOMMENDATIONS

Shoring may be required where space is not available to layback excavations. Excavation shoring may consist of soldier beams that are cantilevered, or other recognized methods. Shoring should be designed by an engineer experienced in shoring design. Shoring will encounter soils as previously addressed herein. Lagging may be used to support the cut between the beams. Grouting is the

preferred method to fill voids between the cut and lagging. Shoring should be designed to include the lowest construction elevation and provide adequate space for foundation construction.

5.7.1 Shored Depth

To facilitate possible removals for building foundation support, shoring should be designed for at least three feet of soil removal and recompaction depth below the bottom of the proposed footing elevations.

5.7.2 Shoring Soil Pressure

Shoring should be designed for lateral earth pressure plus lateral pressure imposed by adjacent surcharges. Cantilevered shoring systems should be designed for an active earth pressure equal to 30 pounds per cubic foot for the onsite clay soils in a level condition. This value is an ultimate value without a factor of safety. The width of active pressure acting on the pile below the bottom of the excavation may be taken as the pile diameter. The width should be increased to two pile diameters for a cantilevered soldier pile.

5.7.3 Surcharge Loading

Construction surcharging should be maintained, as a minimum, a horizontal distance equal to the depth of excavation from the shoring unless the shoring is specifically designed for surcharge loading. Lateral pressure on the shoring due to a uniform area surcharge of intensity q (force/area) is equal to a uniform pressure of 0.4q over the entire height of the wall.

5.7.4 Soldier Beam Passive Pressure

A passive earth pressure of 300 pounds per cubic foot (pcf) below the base of excavation may be used for design of soldier beams spaced at least three diameters center to center. This value may be increased to a maximum of 3,000 pounds per square foot (psf). The surface area (pile diameter if encased in structural concrete) may be doubled for soldier beams a minimum of three diameters apart center to center in the evaluation of passive resistance.

5.7.5 Lagging

Lagging consisting of treated timber may be required depending on the depth of the shored excavation and the material encountered. Wood lagging should be new rough timber (full dimension) Douglas fir, straight, free of bends, and free from defects that might impair structural strength. Lagging to be left in-place shall be pressure treated for contact with soil. The upper two feet of shoring and lagging measured from the adjacent grade may be removed when the shoring is no longer needed for support of the excavation.

Lagging should be designed to resist an equivalent fluid pressure equal to 30 pcf measured below the ground surface. A maximum lagging pressure of 300 psf may be assumed where the maximum soldier beam spacing does not exceed 8 feet center to center.

5.7.6 Pile Construction

The shoring contractor should be prepared to provide methods to prevent caving where low cohesive soils or groundwater are encountered. Construction should be performed in general accordance with ACI (American Concrete Institute) Manual of Concrete Practice, Section ACI 336.3R Design and Construction of Drilled Piers. Slurry should be used to support the pile excavations when adding water to the excavations is not sufficient to prevent caving of the excavations. The slurry may consist of a mixture of water and chemical polymers. The method selected by the contractor for excavation and construction of the drilled shafts should be discussed with this office. Piles should be drilled and cast in the same day.

Care should be exercised when casting adjacent piles to avoid blowout from one excavation into the other. Excavated materials from drilled shaft construction should not be spread over any areas of construction unless properly placed and compacted. Drilled pile excavation should be observed by this office to verify the anticipated geotechnical conditions.

5.7.7 Shoring Plan Review and Construction Inspection

A structural engineer with shoring experience should prepare the shoring plans. Our office should be provided the proposed shoring plans and calculations for review. Variations in subgrade conditions or construction techniques exercised by the Shoring Contractor should be reviewed by this office. This office should also perform geotechnical observations during the shoring construction.

5.8 SHALLOW FOUNDATION DESIGN

Geotechnical recommendations for conventional foundation systems are presented below based on soils with a medium to high expansion potential (51-130 Expansion Index range).

5.8.1 Conventional Footings

Continuous and isolated footings may be designed to impose an allowable bearing pressure of 2,000 pounds per square foot (psf). These bearing pressures apply for dead plus live loads and may be increased by one-third when considering wind or seismic loads.

Continuous and isolated footings should have minimum widths of 12 and 18 inches, respectively. The footings should be embedded a minimum of 30 inches. Embedment of exterior footings should be measured from the lowest adjacent exterior grade. Interior footings may be measured from the top of slab. Bearing values may be increased by 100 psf for each additional foot of depth above the minimum to a maximum of 3,000 psf. After excavation, footing bottoms should be observed by a representative of this office to evaluate if additional soil removal or recompaction is warranted.

Steel reinforcement should be per the structural engineer's recommendations; however, minimum continuous footing reinforcement should consist of two #5 bars in the top and bottom (total of 4 bars).

5.8.2 Conventional Footings - Retrofit

The seismic retrofit may be supported on continuous and isolated footings founded in suitable compacted fill soils or competent native soils and should be a minimum of 12 and 24 inches wide, respectively. Footings may be designed to impose an allowable soil bearing pressure of 2,000 psf provided they are a minimum of 30 inches below the lowest adjacent grade. This value includes a factor of safety of 3; so ultimate, without a factor of safety, soil bearing pressure of 6,000 psf may be used for existing buildings. The lowest adjacent grade is the lowest soil grade adjacent the footings, interior or exterior. The above net allowable bearing capacity may be increased by one-third for short-term wind and seismic loads.

Where the new footings are adjacent to existing footings they should be founded at the same depth, where possible. The new footings should not surcharge the existing footings, unless approved by the project structural engineer.

Steel reinforcement should be per the structural engineer's recommendations. However, minimum reinforcement for continuous footings should consist of two #5 bars in the top and bottom (minimum total of four bars).

5.8.3 Mat Foundation

Mat slabs may be designed using a modulus of subgrade reaction "k" of 90 pounds per cubic inch at the surface of a properly prepared building pad. A bearing pressure of 1,500 psf may be used at the surface of a properly prepared building pad.

5.8.4 Resistance to Lateral Loads

Passive soil pressure and friction may be used to resist lateral forces on the foundations. Lateral passive earth pressure may be considered equal to a fluid weighing 300 psf per foot to a maximum of 1,800 psf where the footing is on level ground. Base friction between the bottom of the footings and soil may be computed at 0.15 times the normal load. Lateral passive earth pressure and base friction have a factor of safety of 1.5 and may be combined without reduction. Ultimate values of 400 psf/ft for lateral passive earth pressure on level ground and 0.23 base friction may be used for retrofit.

5.8.5 Foundation Settlement

Settlements of new shallow footings due to static loading are anticipated to be minor with settlement on the order of ½ to 1-inch. This should be confirmed when the actual foundation loads become available. Differential settlements between adjacent columns with similar static loading are anticipated to be on the order of one half the total settlements. Differential settlement between new and existing foundations should be evaluated when the actual foundation locations and loads become available.

The potential for seismic induced settlement due to liquefaction has been previously discussed in this report.

All structures settle during construction and minor structure settlement can occur after construction during the life of the project. Minor wall or slab cracking may also be associated with settlement or expansive soil movement. Wall cracking can also occur associated with expansion and contraction of structural wood members due to thermal or moisture changes. Settlement or soil movement could occur if the soils become saturated due to excessive water infiltration generally caused by excessive irrigation, poor drainage, etc.

5.8.6 Footing Excavations

Footings should be cut square and level and cleaned of slough and soils silted into the excavations. A representative of this office should observe the footing excavations prior to placing reinforcing steel. The footings should be cast as soon as possible to avoid deep desiccation of the footing subsoils. Soil excavated from the footing trenches should not be spread over areas of construction unless properly compacted.

5.8.7 Moisture Penetration

Conventional footings subgrade soils should be premoistened to 3% over the optimum moisture content for a depth of 18 inches. However, the subgrade soils should not be flooded or soaked creating a saturated condition. A representative of this office should observe the subgrade soil premoistening prior to casting the concrete. Soils silted into the footing excavations during the premoistening operations should be removed prior to casting the concrete.

5.9 FLAGPOLE FOOTINGS

New, remodeled, or retrofit structures may be supported by flagpole footings. These footings (piles) may be designed using an allowable lateral bearing pressure of 300 psf per foot of depth for level ground (maximum pressure should not exceed 2,500 psf). This value has a factor of safety of 1.5. If deflection of pole foundations is a concern, deflection calculations can be provided when loads are known.

5.9.1 Micropiles

The axial load capacity of eight-inch diameter micropiles is based on the frictional resistance developed between the pile and the surrounding soils. The allowable downward axial capacity curve is presented in Appendix D, Figure D-1. The allowable capacities shown are based on friction only and have a factor of safety of 2. Uplift capacity may be taken as 2/3 of downward.

Piles should be spaced at least three pile diameters apart. For reduction in group capacity, the number of piles and spacing should be provided. However, in general, at 3 pile diameters (2') the downward capacity should be 80% of provided capacity and at 6 pile diameters the downward capacity is 100%; linear interpretation may be used in between. Preproduction and production testing of axial capacity should be performed.

Micropiles should not carry any horizontal loads. A passive pressure of 300 psf per foot to a maximum of 1,800 psf on level ground may be used for the pile cap.

5.9.2 Pile Construction

Depending upon the length of the pile and the groundwater level at the time of construction, seepage may be encountered during pile construction. As previously stated, groundwater was encountered in our exploratory borings at depths ranging from 17 feet to 20½ feet below ground surface.

Piles may be constructed below groundwater provided construction is performed in general accordance with ACI (American Concrete Institute) Manual of Concrete Practice, Section ACI 336.3R Design and Construction of Drilled Piers. Slurry may be used to support the pile borings. The slurry may consist of a mixture of water and chemical polymers or bentonitic materials. The method selected by the contractor for excavation and construction of drilled shafts should be discussed with this office. Piles which encounter groundwater should be drilled and cast in the same day. All other piles should be filled with concrete within a maximum period of 24 hours of being drilled.

Due to layers of sand, some caving or raveling should be anticipated during the pile construction. To minimize caving potential, piles should be filled with concrete in a timely manner and not left open overnight. The drilling contractor should be prepared to use casing or slurry in areas where excessive caving occurs.

Care should be exercised when casting adjacent piles to avoid blowout from one excavation into the other. From an engineering standpoint, the preferred method would be to excavate, cast, and let the concrete achieve initial set prior to excavating the adjacent pile. However, where spacing between adjacent piles is greater than three times the largest pile diameter, satisfactory results have been achieved by casting adjacent piles simultaneously, keeping the differential elevation of the concrete less than five feet between piles.

5.10 SLAB DESIGN

5.10.1 Slabs-On-Grade

The concrete slabs-on-grade within the building interiors should be a minimum of 4 inches thick and underlain by a minimum of 6 inches of aggregate as required by the applicable building code. Reinforcement should consist of a minimum of #4 bars at 18 inches on centers in both directions or per the structural engineer's design. The slab steel reinforcement should be extended into the foundations to within 3 inches of the footing bottom at 36 inches on center.

5.10.2 Concrete Placement and Cracking

Minor cracking of concrete slabs is common and is generally the result of concrete shrinkage continuing after construction. Concrete shrinks as it cures resulting in shrinkage tension within the concrete mass. Since concrete is weak in tension, development of tension results in cracks within the concrete. Concrete should be placed using procedures to minimize the cracking within the slab. Shrinkage cracks can become excessive if water is added to the concrete above the allowable limit and proper finishing and curing practices are not followed. Concrete mixing, placement, finishing, and curing should be performed per the American Concrete Institute Guide for Concrete Floor and Slab Construction (ACI 302.1R). Concrete slump during placement should not exceed the design slump specified by the structural engineer. Where shrinkage cracks would be unsightly, concrete slabs on grade should be provided with tooled crack control joints at 10-15 foot centers or as specified by the structural engineer.

5.10.3 Under-Slab Treatment

Where moisture sensitive floor coverings will be utilized, an appropriate moisture vapor retarder layer should be installed and maintained below the concrete slabs to reduce moisture vapor transmission through the slab. Ten-mil plastic sheeting is commonly used as a moisture vapor retarder layer. If a higher degree of moisture retarder is warranted, a retarder in general accordance with ASTM E 1745 *Standard Specification for Plastic Water Vapor Retarders Used in Contact with Soil or Granular Fill under Concrete Slabs* should be considered below the interior concrete slabs on-grade installed per ASTM E1643 *Standard Practice for Installation of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs*.

Perforations through the moisture vapor retarder such as at pipes, conduits, columns, grade beams, and wall footing penetrations should be sealed per the manufacturer's specifications or the previously cited ASTM E1643. Proper construction practices should be followed during construction of the slab on-grade. Repair and seal tears or punctures in the moisture barrier that may result from the construction process prior to concrete placement.

Minimizing shrinkage cracks in the slab-on-grade can further minimize moisture vapor emissions. A properly cured slab utilizing low-slump concrete will reduce the risk of shrinkage cracks in the slab as described herein.

The concrete contractor should be made aware of the moisture vapor retarder and be required to protect the layer. Perforations made in the layer by the concrete contractor should be properly sealed prior to concrete placement. In addition, if the concrete is placed directly on top of the layer the concrete contractor should make the necessary changes in the concrete placement and curing. Placing the concrete directly on top of the moisture vapor retarder layer allows the layer to be observed for damage directly prior to concrete placement.

The slabs should be tested for moisture content prior to the selection of the flooring and adhesives. Moisture in the slabs should not exceed the flooring manufacturer's specifications. The concrete surface should be sealed per the manufacturer's specifications if the moisture readings are excessive.

Where cuts are made into the slab for future construction, the moisture vapor retarder layer should be repaired per the manufacturer's recommendation. Information regarding the need to repair the moisture vapor retarder layer and information on the selection of acceptable floor coverings should be conveyed to the school district personnel.

5.10.4 Moisture Penetration

Conventional footings and reinforced slab-on-grade subgrade soils should be premoistened to 3% over the optimum moisture content for a depth of 18 inches. However, the subgrade soils should not be flooded or soaked creating a saturated condition. A representative of this office should observe the subgrade soil premoistening prior to casting the concrete. Soils silted into the footing excavations during the premoistening operations should be removed prior to casting the concrete.

5.11 LANDSCAPING ADJACENT TO BUILDINGS

If planting is required up against or near a building, from the geotechnical point of view, the following should be maintained:

- Positive drainage should be continuously maintained away from structures
- Trees and large shrubbery should not be planted where roots can grow under foundations and flatwork when they mature
- Landscape watering should be held to a minimum; however, landscaped areas should be maintained in a uniformly moist condition and not allowed to dry-out
- If raised planter beds are utilized, they should be sealed and the building should be waterproofed
- Soil amendments should not be corrosive to the foundations or utilities
- Compacted soil adjacent to the building should be at 90% relative compaction

5.12 RETAINING WALLS

5.12.1 General

Retaining walls, if any, may be constructed within the Site using the following recommendations. Lateral pressures exerted on retaining walls by backfill material will depend on the type of backfill materials used (gravel, clay, etc.), and the ability of the wall to deflect or rotate at the top. Cantilever type retaining walls capable of deflecting and/or rotating may be designed for active pressure conditions. However, restrained retaining walls should be designed for at-rest earth pressures, which are higher than the active pressure.

Additional pressure may also be exerted on retaining walls besides the backfill pressure. For example, foundations located behind retaining walls will laterally surcharge the retaining wall. Furthermore, sloping backfill materials will exert more lateral pressure on retaining walls than level backfill.

Geotechnical recommendations for retaining wall design are provided below. All backfill materials are assumed to be low- to non-expansive granular materials. Onsite soils are generally not suitable for retaining wall backfill materials.

5.12.2 Retaining Wall Foundations

Shallow footings should be at least 24 inches wide and embedded at least 30 inches into firm soils. Footings of minimum size and embedment, placed in firm competent materials may be designed for a maximum bearing capacity of 2,000 pounds per square foot (psf). The bearing capacity may be increased by 100 psf for each additional foot increase in footing depth, up to a maximum bearing capacity of 3,000 psf. The allowable bearing capacity may be increased by one-third for short term loads associated with wind and seismic loading.

Footing excavations should be observed by a representative of this office prior to placing reinforcing steel. Loose or soft soils exposed in the excavation should be overexcavated and the area backfilled with fill compacted to at least 90 percent compaction, as directed by this firm.

5.12.3 Lateral Earth Pressures

Retaining walls should be backfilled with granular soils having a very low to low expansion potential (Expansion Index less than 50). Walls allowed to yield at the top may be designed for an active pressure of 40 and 62 pounds per cubic foot for a level and 2(horizontal):1(vertical) slope backfill condition, respectively. Retaining walls fixed at the top should be designed to resist an at-rest earth pressure equivalent to a fluid having a density of 60 pcf for level backfill. The above soil pressures are not designed to resist expansion of the backfill or hydrostatic pressures due to water. Therefore, backfill should be well drained. Wall heights are measured from the top of the retained material to the bottom of the foundation. Aerial surcharge may be treated as additional height of backfill where one foot of additional height is assumed for each 125 psf of aerial surcharge.

5.12.4 Lateral Seismic Pressure

Retaining walls greater than 6 feet in height should be designed for a seismic lateral pressure. Utilizing the County of Los Angeles design method indicates, for cantilevered walls the seismic equivalent fluid pressure may be taken as 10 pounds per cubic foot for level backfill. For restrained walls the seismic equivalent fluid pressure may be taken as 16 pounds per cubic foot. This force is added to the static earth pressures.

$\Delta P_{AE} = ½*\gamma*H^2*(.42*PGA/g) = ½*115*H^2*(.42*0.4) = 10$ pcf for level backfill

$\Delta P_{AE} = ½*\gamma*H^2*(.68*PGA/g) = ½*115*H^2*(.68*0.4) = 16$ pcf for basement / restrained wall

Where $PGA = S_{DS}/2.5 = 1.0/2.5 = 0.4$

5.12.5 Waterproofing

Retaining walls should be waterproofed prior to installing the drainage system and wall backfill.

5.12.6 Drainage

A drainage system should be constructed behind retaining walls over two feet high to mitigate possible buildup of hydrostatic pressures. The drainage system may consist of either a drainage composite or granular drain consisting of a minimum 12 inch wide zone of 3/4 ± inch rock separated from the native materials by a single layer of filter cloth. The drainage system should extend to within 2 feet of finish grade with the upper 2 feet backfilled with native material. The drainage system should be hydraulically connected to a perimeter pipe drain consisting of a minimum 4 inch diameter perforated PVC (Schedule 40) pipe or equivalent. The pipe may be laid horizontally on the footing with the pipe invert at least 6 inches below any adjacent top of slab-on-grade. The outlet pipe from the perimeter drain should be a non-perforated 4 inch diameter PVC (Schedule 40) pipe that is sloped to drain to an appropriate location. An as-built plan should be prepared detailing the location of the wall drainage system.

5.12.7 Backfilling

Retaining walls should be backfilled with soils having an Expansion Index of less than 50, which may require select grading or import. The backfill should be placed in 6-inch lifts at slightly over optimum moisture content and compacted to at least 90 percent relative compaction. If the backcut is flatter than ½(horizontal):1(vertical), the backfill should be benched into the backcut slope. Light equipment should be used immediately behind the walls to prevent possible over-stressing.

5.13 EXTERIOR SLABS AND WALKWAYS

Exterior concrete slabs-on-grade and walkways should be a minimum of 4 inches thick and underlain by a minimum of 4 inches of sand. Exterior slabs should be reinforced with a minimum of #3 bars on 24 inch centers in each direction. Slabs should have crack control joints (full depth joints) at intervals of 10 to 15 feet. Sidewalks may consist of unreinforced concrete provided the walks are provided with crack control joints at spacing equal to the walk width.

Concrete subgrade soils should be properly placed and compacted for support of the concrete flatwork. Prior to placing concrete, the subgrade soils should be premoistened to a minimum of 3% over the optimum moisture content for a minimum depth of 12 inches. Proper premoistening can reduce the risk of slab subgrade expansion, if used in addition to other preventive measures. Subgrade soil pre-moistening should be observed by this office prior to placing the concrete.

5.14 PRELIMINARY PAVING SECTION

5.14.1 Structural Section

Structural sections consisting of asphaltic concrete (AC) placed over a compacted layer of aggregate base are provided in the table below based on an R value for the subgrade soils of less than 5. The asphalt and base should be properly placed and compacted to a minimum of 95% relative compaction. The project civil engineer should determine the appropriate traffic index for the pavement area. If buses will be using any of the drive areas a higher traffic index and thicker pavement section should be considered.

Asphalt pavements should be maintained by filling cracks that appear and with periodic application of fog sealers to replace surface oils that are lost due to weathering and wear.

PRELIMINARY PAVEMENT SECTIONS	
Traffic Index	Assumed “R” Value ≤ 5
4.0 playground	3” AC / 7” AB
5.0 parking	3” AC / 10” AB
6.0 automobile traffic / fire lane	3” AC / 14” AB or 4” AC / 12”
AC = Asphaltic Concrete AB = Aggregate Base	

5.14.2 Subgrade Preparation

The subgrade soils within areas of proposed paving should be moistened to slightly above the optimum moisture content and compacted to at least 90% relative compaction prior to placing aggregate base.

5.14.3 Aggregate Base Preparation

The aggregate base materials should be moistened to slightly above the optimum moisture content and compacted to at least 95% relative compaction prior to placing concrete.

5.15 SITE DRAINAGE

Positive drainage should be consistently provided and maintained away from structures during and after construction per the grading plan and/or applicable building codes. In addition, drainage should not be changed creating an adverse drainage condition.

Water should not be allowed to gather or pond against foundations or hardscape allowing water migration into the subgrade. Therefore, landscape watering should be held to a minimum and irrigation systems maintained in good repair. Sprinkler or plumbing leaks should be immediately repaired. Trees should be spaced so that roots will not extend under foundations or slabs. Planters near a structure should be constructed so that irrigation water will not saturate footing and slab subgrade soils.

6.0 PLAN REVIEW

As the design process continues, this office should review the building location, grading plans, foundation plans and specifications prior to starting construction to review conformance to recommendations in this report. Additional geotechnical site evaluation may be necessary when plans are available for the modernization project. Additional analysis and recommendations may be necessary based for the plan review.

7.0 CLOSURE

This report was prepared under the direction of a registered geotechnical engineer and certified engineering geologist. No warranty, expressed or implied, is made as to conclusions and professional advice included in this report. Gorian and Associates, Inc. disclaims any and all responsibility and liability for problems that may occur if the recommendations presented in this report are not followed.

This report was prepared for Los Angeles Unified School District and their design consultants solely for design and construction of the development described herein. This report may not contain sufficient information for other uses or the purposes of other parties. The recommendations are based on interpretations of the subsurface conditions concluded from information gained from subsurface explorations and a surficial site reconnaissance. The interpretations may differ from actual subsurface conditions, which can vary horizontally and vertically across the site. Due to possible subsurface variations, a representative of this office should observe all aspects of field construction addressed in this report. Anyone using this report for bidding or construction purposes should perform such independent investigations as they deem necessary.

The scope of the services provided by Gorian and Associates, Inc. and its staff, excludes responsibility and/or liability for work conducted by others. Such work includes, but is not limited to, means and methods of work performance, quality control of the work, superintendence, sequencing of construction and safety in, on, or about the jobsite.

- CPT Data Files (sent via email)

SUMMARY
OF
CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the Canoga Park High School project located in Canoga Park, California. The work was performed by Kehoe Testing & Engineering (KTE) on November 23, 2021. The scope of work was performed as directed by Gorian & Associates, Inc. personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at six locations to determine the soil lithology. A summary is provided in **TABLE 2.1**.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-15	50	
CPT-17	50	
CPT-18	50	
CPT-19	50	
CPT-20	50	
CPT-21	50	

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm^2 cone with a cone net area ratio of 0.83. The following parameters were recorded at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

At locations CPT-15, CPT-17, CPT-18, CPT-19, CPT-20 & CPT-21, shear wave measurements were obtained at termination depth. The shear wave is generated using an air-actuated hammer, which is located inside the front jack of the CPT rig. The cone has a triaxial geophone, which recorded the shear wave signal generated by the air hammer.

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil behavior type on the CPT plots is derived from the attached CPT SBT plot (Robertson, "Interpretation of Cone Penetration Test…", 2009) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (qc), sleeve friction (fs), and penetration pore pressure (u). The friction ratio (Rf), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

The CPT data files have also been provided. These files can be imported in CPeT-IT (software by GeoLogismiki) and other programs to calculate various geotechnical parameters.

It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and u. In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

KEHOE TESTING & ENGINEERING

Steven P. Kehoe
President

APPENDIX B

LABORATORY TESTING

General

Laboratory test results on selected samples are presented below. Test were performed to evaluate the physical and engineering properties of the encountered earth materials, including in-situ moisture and dry density, compaction characteristics, expansion potential, consolidation characteristics, shear strength parameters, grain size distribution, Atterberg limits. R-value testing was performed under subcontract by a materials testing laboratory. Soil corrosivity testing was performed under subcontract by a corrosion engineer. Laboratory testing from previous explorations (borings B-1 through B-4) at the site is included herein.

Field Density and Moisture Tests

In-situ dry density and moisture content were determined from the relatively undisturbed drive samples obtained during exploratory operations. The test results and a detailed description of the earth materials encountered are shown on the attached Logs of Subsurface Data, Appendix A.

Soil Expansion Test

Expansion Index tests were performed per ASTM D4829 on selected bulk samples of the encountered materials. The results are as follows:

Sample	Expansion Index	Expansion Index Range	Expansion Potential
B-1 @ 2’	83	51 - 90	Medium
B-4 @ 4’	106	91 - 130	High
B-12 @ 3’	96	91 - 130	High
B-13 @ 3’	117	91 - 130	High
B-16 @ 1’	43	21 - 50	Low

Optimum Moisture-Maximum Density Curve

Maximum density/optimum moisture tests (compaction characteristics) were performed per ASTM D1557 on selected bulk samples of the encountered materials. The results are as follows:

Sample	Visual Soil Classification	Maximum Dry Density (pcf)	Optimum Moisture Content (%)
B-1 @ 2’	Brown silty clay	117.9	13.3
B-2 @ 5’	Brown silty clay w/ calcium carbonate	113.7	15.7
B-12 @ 5’	Dark yellow brown silty clay	108.3	16.8
B-16 @ 5’	Yellow brown silty clay	113.7	14.4

Direct Shear Tests

Strain controlled direct shear testing was performed (currently and previous evaluations) on six relatively undisturbed samples and four remolded sample sets. The sample sets were saturated prior to shearing under axial loads ranging from 920 to 3,680 psf. The shear strength results are presented as graphic summaries.

Load Consolidation Testing

Load consolidation tests were conducted on nine relatively undisturbed drive samples (current and prior evaluation). Test loads were added in increments to a maximum of 8,000 psf. Water was added at the approximate overburden pressure to study the effect of moisture infiltration on potential consolidation behavior. The consolidation results are presented on the attached figures as graphic summaries.

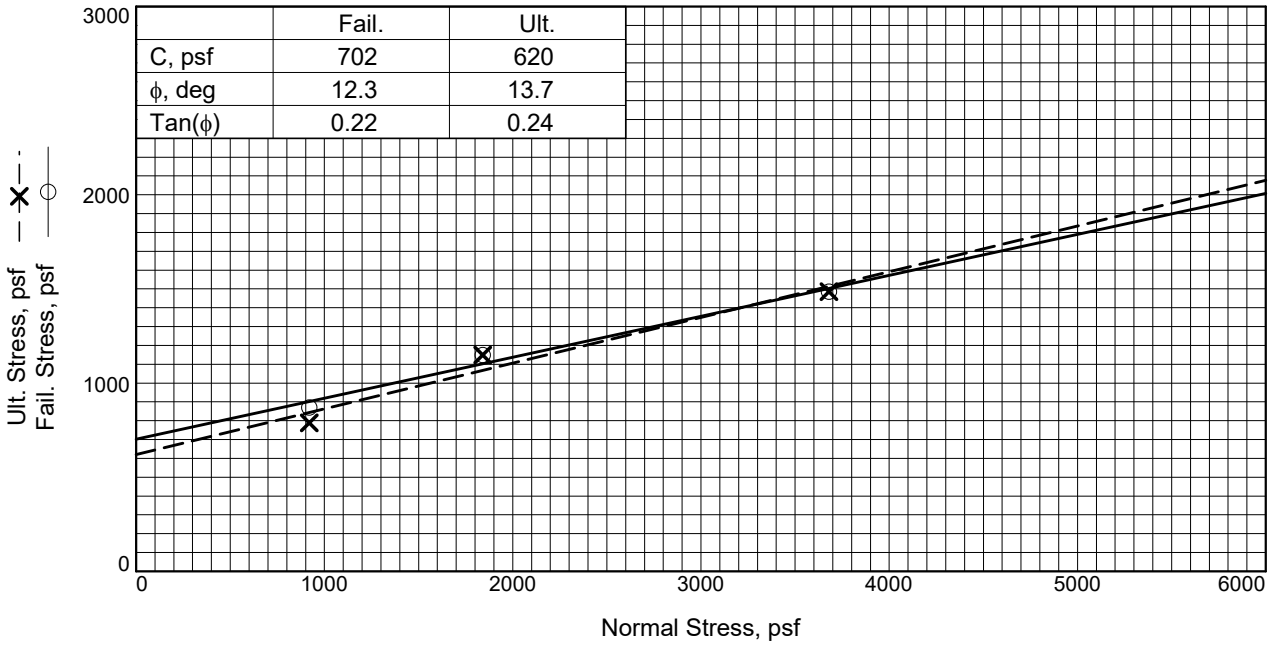
Atterberg Limit Tests

Atterberg Limit tests were performed on a representative sample of the fine-grained material onsite.

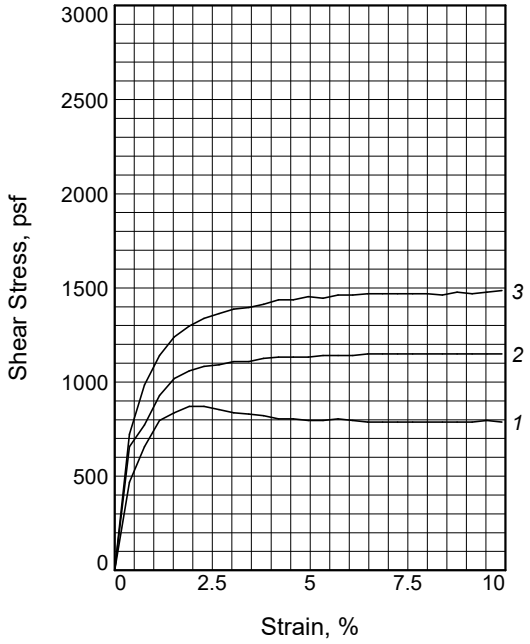
Sample	Liquid Limit	Plasticity Index	Soil Classification
B-4 @ 10'	57	35	CH
B-15 @ 17½'	36	16	CL

Grain Size Distribution

Grain size distribution analyses were performed on several bulk samples. The grain size was evaluated using a hydrometer and 3/8", #4 and #10 sieves. The percentage sand, percentage silt, and percentage clay were evaluated. A table summarizing the results is presented below.



HYDROMETER RESULTS							
Boring	Depth (feet)	% Gravel	% Sand	% Silt	% Clay	% Fines (silt and clay)	Classification
B-4	20	2	42	35	21	56	CL
B-4	30	1	52	32	15	47	SC
B-4	40	--	49	33	18	51	SC/CL
B-11	3	--	33	35	32	67	CL
B-12	12½	--	27	34	39	73	CL
B-13	2	--	13	41	46	87	CL
B-14	3	--	28	38	34	72	ML/CL
B-15	20	--	52	26	22	48	SC/CL
B-16	42½	--	68	16	16	32	SM/SC



R-Value Determination

An R-Value determination was conducted by a subcontractor on a composite of the soils encountered in the proposed pavement area. The test was performed in general accordance with the California State Test Method No. 301-F. An R-Value of less than 5 is indicated. The test results are attached.

Corrosion Testing

Five soil samples from the current evaluation were sent under separate contract to be tested for corrosive properties. The test results and report from the Corrosion Engineer are presented in Appendix B-1.

1 Executive Summary

A corrosion evaluation of the soils at Canoga Park HS was performed to provide corrosion control recommendations for general construction materials. The site is located at Canoga Park High School, 6850 CA-27, Canoga Park, CA 91303. Six (6) samples were tested to a depth of 4.0 ft. Site ground water and topography information was provided by Gorian & Associates, Inc.. Groundwater depth was determined to be 18 feet below finished grade.

Every material has its weakness. Aluminum alloys, galvanized/zinc coatings, and copper alloys do not survive well in very alkaline or very acidic pH environments. Copper and brasses do not survive well in high nitrate or ammonia environments. Steels and irons do not survive well in low soil resistivity and high chloride environments. High chloride environments can even overcome and attack steel encased in normally protective concrete. Concrete does not survive well in high sulfate environments. And nothing survives well in high sulfide and low redox potential environments with corrosive bacteria. This is why Project X tests for these 8 factors to determine a soil's corrosivity towards various construction materials. **Depending solely on soil resistivity or Caltrans corrosion guidelines (which concentrate on concrete/steel highways), will over-simplify descriptions as corrosive or non-corrosive. This approach will not detect these other factors attacking other metals because it is possible to have bad levels of corrosive ions and still have greater than 1,100 ohm-cm soil resistivity. We have observed this fact on thousands of soil samples tested in our laboratory.**

It should not be forgotten that import soil should also be tested for all factors to avoid making your site more corrosive than it was to begin with.

The recommendations outlined herein are not a substitute for any design documents previously prepared for the purpose of construction and apply only to the depth of samples collected.

Soil samples were tested for minimum resistivity, pH, chlorides, sulfates, ammonia, nitrates, sulfides and redox.

As-Received soil resistivities ranged between 476 ohm-cm and 8,040.0 ohm-cm. This data would be similar to a Wenner 4 pin test in the field and used in the design of a cathodic protection or grounding bed system. This resistivity can change seasonally depending on the weather and moisture in the ground. This reading alone can be misleading because condensation or minor water leaks will occur underground along pipe surfaces creating a saturated soil environment in the trench on infrastructure surfaces. This is why minimum or saturated soil resistivity measurements are more important than as-received resistivities.

Saturated soil resistivities ranged between 462 ohm-cm to 3,149 ohm-cm. The worst of these values is considered to be severely corrosive to general metals.

PH levels ranged between 8.0 to 8.9 pH. PH levels were determined to be at levels not detrimental to copper or aluminum alloys. The pH of these samples can allow corrosion of steel and iron in moist environments.

Chlorides ranged between 13 mg/kg to 123 mg/kg. Chloride levels in these samples are low and may cause insignificant corrosion of metals.

Sulfates ranged between 110 mg/kg to 2,324 mg/kg. At all locations except around sample B-14, Sulfate levels in these samples are moderate for corrosion of metals and cement. Type II cement should be used that does not contain encased metal.

For the area around sample B-14, Sulfate levels in these samples are severe for corrosion of metals and cement. Type V cement and coatings for metals should be used.

Ammonia ranged between 0.6 mg/kg to 9.4 mg/kg. Nitrates ranged between 0.0 mg/kg to 421.0 mg/kg. Concentrations of these elements were high enough to cause accelerated corrosion of copper and copper alloys such as brass.

Sulfides presence was determined to be trace. REDOX ranged between + 136 mV to + 200 mV.

Though sulfides were detected, the probability of corrosive bacteria was determined to be low due to very positive REDOX levels determined in these samples.

2 Corrosion Control Recommendations

The following recommendations are based upon the results of soil testing.

2.1 Cement

The highest reading for sulfates was 2,324 mg/kg or 0.2324 percent by weight.

At all locations except around sample B-14, Per ACI 318-14, Table 19.3.1.1, sulfate levels in these samples categorized as S1 and are moderate for corrosion of metals and cement. Per ACI 318-14 Table 19.3.2.1 Type II, IP(MS), IS(MS), IT(MS) cement should be used, with a maximum water/cement ratio of 0.50, and minimum strength of 4,000 psi per applicable code.

For the area around sample B-14, Per ACI 318-14, Table 19.3.1.1, sulfate levels in these samples categorized as S2 and are severe for corrosion of metals and cement. Type V, IP(HS), IS(HS), or IT(HS) cement should be used, with a maximum water/cement ratio of 0.45, and minimum strength of 4,500 psi per applicable code.

2.2 Steel Reinforced Cement/ Cement Mortar Lined & Coated (CML&C)

Chlorides in soil can overcome the corrosion inhibiting property of cement for steel, as it can also break through passivated surfaces of aluminum and stainless steels.[1,2] The highest concentration of chlorides was 123 mg/kg.

Chloride levels in these samples are not significantly corrosive to metals not in tension. Standard cement cover may be used in these soils.

Though soils at some locations are significantly corrosive to various metals, per ACI 318-14 Chapter 19 Table 19.3.1.1, all slabs on this site exposure categories and class for **Corrosion Protection of Reinforcement (C) would be considered C1** as Concrete exposed to moisture [mud/rain] (slab sides and bottom) but not to an external source of chlorides. Though there are chlorides in the soil, ACI 318's definition of "external source of chlorides" consists of deicing chemicals, salt, brackish water, seawater, or spray from these sources. The chloride levels in seawater are typically over 19,000 mg/L or 19,000 ppm.

[1] Design Manual 303: Cement Cylinder Pipe. Ameron. p.65
[2] *Chapter 19, Table 1904.2.2(1), 2012 International Building Code*

When concrete is tested for water-soluble chloride ion content, the tests should be made at an age of 28 to 42 days. The limits in Per ACI 318-14 Table 5.3.2.1 are to be applied to chlorides contributed from the concrete ingredients, not those from the environment surrounding the concrete.[3]

2.3 Stainless Steel Pipe/Conduit/Fittings

Stainless steels derive their corrosion resistance from their chromium content and oxide layer which needs oxygen to regenerate if damaged. Thus stainless steel is not good for deep soil applications where oxygen levels are extremely low. Stainless steels should not be installed deeper than a plant root zone. Stainless steels typically have the same nobility as copper on the galvanic series and can be connected to copper. If stainless steel must be used, it must be backfilled with soil having greater than 10,000 ohm-cm resistivity and excellent drainage. 304 Stainless steel will also corrode if in contact with carbon materials such as activated carbon. Stainless steel welds should be pickled.

The soil at this site has low probability for anaerobic corrosive bacteria and low chloride levels. Per Nickel Institute guidelines, 304 or 316 Stainless steels can be used in these soils.

2.4 Steel Post Tensioning Systems

The proper sealing of stressing holes is of utmost importance in PT Systems. Cut off excess strand 1/2" to 3/4" back in the hole. Coat or paint exposed anchorage, grippers, and stub of strands with "Rust-o-leum" or equal. After tendons have been coated, the cement contractor shall dry pack blockouts within ten (10) days. A non-shrink, non-metallic, non-porous moisture-insensitive grout (Master EMACO S 488 or equivalent), or epoxy grout shall be used for this purpose. If an encapsulated post-tension system is used, regular non-shrink grout can be used.

Soil with high chloride levels is considered an aggressive environment for post-tensioning strands and anchors. Due to the high chloride levels determined on-site, implement all of the following measures:[4,5,6]

1) Completely encapsulate the tendon and anchor with polyethylene to create a watertight seal. Epoxy or powder coated hardware would be equivalent to polyethylene coated and impermeable waterproofing system.
2) Add grease caps to the cut strand at live end anchors to provide extra protection against corrosion due to high chloride concentrations.
3) All components exposed to the job site should be protected within one working day after their exposure during installation.
4) Ensure the minimum cement cover over the tendon tail is 1-inch, or greater if required by the applicable building code.

---

[4] *Standard Requirements for Design and Analysis of Shallow Post-Tensioned Concrete Foundations on Expansive Soils, PTI DC10.5-12,Table 4.1, pg 16*

[5] *Specification for Unbonded Single Strand Tendons. Post-Tensioning Institute (PTI), Phoenix, AZ, 2000.*

[6] *ACI 423.6-01: Specification for Unbonded Single Strand Tendons. American Cement Institute (ACI), 2001*

5) Caps and sleeves should be installed within one working day after the cutting of the tendon tails and acceptance of the elongation records by the engineer.
6) Inspect the following to ensure the encapsulated system is completely watertight:
   a) Sheathing: Verify that all damaged areas, including pin-holes, are repaired.
   b) Stressing tails: After removal, ensure they are cut to a length for proper installation of P/T coating filled end caps.
   c) End caps: Ensure proper installation before patching the pocket former recesses.
   d) Patching: Ensure the patch is of an approved material and mix design, and installed void-free.
   e) Limit the access of direct runoff onto the anchorage area by designing proper drainage.
   f) Provide at least 2 inches of space between finish grade and the anchorage area, or more if required by applicable building codes.

2.5 Steel Piles

Steel piles are most susceptible to corrosion in disturbed soil where oxygen is available. Further, a dissimilar environment corrosion cell would exist between the steel embedded in cement, such as pile caps and the steel in the soil. In the cell, the steel in the soil is the anode (corroding metal), and the steel in cement is the cathode (protected metal). This cell can be minimized by coating the part of the steel piles that will be embedded in cement to prevent contact with cement and reinforcing steel.

Piles driven into soils without disturbing soils will avoid oxygen introduction and low corrosion rates unless there is a probability for corrosive anaerobic bacteria. Galvanized steel's zinc coating can provide significant protection for driven piles. In corrosive soils in which normal zinc coatings are not enough, the life of piles can be extended by increasing zinc coating thickness, using sacrificial metal, or providing a combination of epoxy coatings and cathodic protection. Corrosion has been observed to be extremely localized even at and below underground water tables. Pit depths of this magnitude do not have an appreciable effect on the strength or useful life of piling structures because the reduction in pile cross section is not significant.[7] Pitting is of more importance to pipes transporting liquids or gases which should not be leaked into the ground.

The following recommendations are recommended to achieve desired life. We defer to structural engineers to use our estimated corrosion rates and to choose from the corrosion control options listed below.

1) Sacrificial metal by use of thicker piles per non-disturbed soil corrosion rates, or
2) Galvanized steel piles per non-disturbed soil corrosion rates, or
3) Combination of galvanized and sacrificial metal per non-disturbed soil corrosion rates, or

[7] Melvin Romanoff, Corrosion of Steel Pilings in Soils, National Bureau of Standards Monograph 58, pg 20.

4) For no loss of metal, coat entire pile with abrasion resistant epoxy coating such as 3M Scotchkote 323, or PowercreteDD, or equivalent, or
5) Use high yield steel which will corrode at the same rate as mild steel but have greater yield strength and thus be able to suffer more material loss than mild steel.

2.5.1 Expected Corrosion Rate of Steel and Zinc in disturbed soil

In general, the corrosion rate of metals in soil depends on the electrical resistivity, the elemental composition, and the oxygen content of the soil. Soils can vary greatly from one acre to the next, especially at earthquake faults. The better a soil is for farming; the easier it will be for corrosion to take place. Expansive soils will also be considered disturbed simply because of their nature from dry to wet seasons.

In Melvin Romanoff's NBS Circular 579, the corrosion rates of carbon steels and various metals was studied over long term periods. Various metals were placed in various soil types to gather corrosion rate data of all metals in all soil types. Samples were collected and material loss measured over the course of 20 years in some sites. The following corrosion rates were estimated by comparing the worst results of soils tested with similar soils in Romanoff's studies and Highway Research Board's publications.[8] The corrosion rate of zinc in disturbed soils is determined per Romanoff studies and King Nomograph.[9]

Expected Corrosion Rate for Steel = 2.02 mils/year for one sided attack

Expected Corrosion Rate for Zinc = 0.67 mils/year for one sided attack.

Note: 1 mil = 0.001 inch

In undisturbed soils, a corrosion rate of 1 mil/year for steel is expected with little change in the corrosion rate of zinc due to it's low nobility in the galvanic series.

Per CTM 643: Years to perforation of corrugated galvanized steel culverts

- 25.7 Years to Perforation for a 18 gage metal culvert
- 33.4 Years to Perforation for a 16 gage metal culvert
- 41.1 Years to Perforation for a 14 gage metal culvert
- 56.5 Years to Perforation for a 12 gage metal culvert
- 72.0 Years to Perforation for a 10 gage metal culvert
- 87.4 Years to Perforation for a 8 gage metal culvert

2.5.2 Expected Corrosion Rate of Steel and Zinc in Undisturbed soil

Expected Corrosion Rate for Steel = 1 mils/year for one sided attack

Expected Corrosion Rate for Zinc = 0.67 mils/year for one sided attack.

Note: 1 mil = 0.001 inch

[8] Field test for Estimating Service Life of Corrugated Metal Culverts, J.L. Beaton, Proc. Highway Research Board, Vol 41, P. 255, 1962
[9] King, R.A. 1977, Corrosion Nomograph, TRRC Supplementary Report, British Corrosion Journal

2.6 Steel Storage tanks

Underground fuel tanks must be constructed and protected in accordance with California Underground Storage Tank Regulations, CCR, Title 23, Division 3, Chapter 16. Metals should be protected with cathodic protection or isolated from backfill material with an epoxy coating.

2.7 Steel Pipelines

Though a site may not be corrosive in nature at the time of construction, **installation of corrosion test stations and electrical continuity joint bonding should be performed during construction** so that future corrosion inspections can be performed. If steel pipes with gasket joints or other possibly non-conductive type joints are installed, their joints should be bonded across by welding or pin brazing a #8 AWG copper strand bond cable. Electrical continuity is necessary for corrosion inspections and for cathodic protection.

Corrosion test stations should be installed every 1,000 feet of pipeline.

Test stations shall have two #8 HMWPE copper strand wire test leads welded or pin brazed to the underground pipe, brought up into the test station hand hole and marked CTS. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

At isolation joints and pipe casings, 4 wire test stations shall be installed using #8 HMWPE copper strand wire test leads. Use different color wires to distinguish which wires are bonded to one side of isolation joint or to casing. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

Prevent dissimilar metal corrosion cells per NACE SP0286:

1) Electrically isolate dissimilar metal connections
2) Electrically isolate dissimilar coatings (Epoxy vs CML&C) segments connections
3) Electrically isolate river crossing segments
4) Electrically isolate freeway crossing segments
5) Electrically isolate old existing pipelines from new pipelines
6) Electrically isolate aboveground and underground pipe segments with flange isolation joint kits per NACE SP0286 to avoid galvanic corrosion cells. **These are especially important for fire risers.**

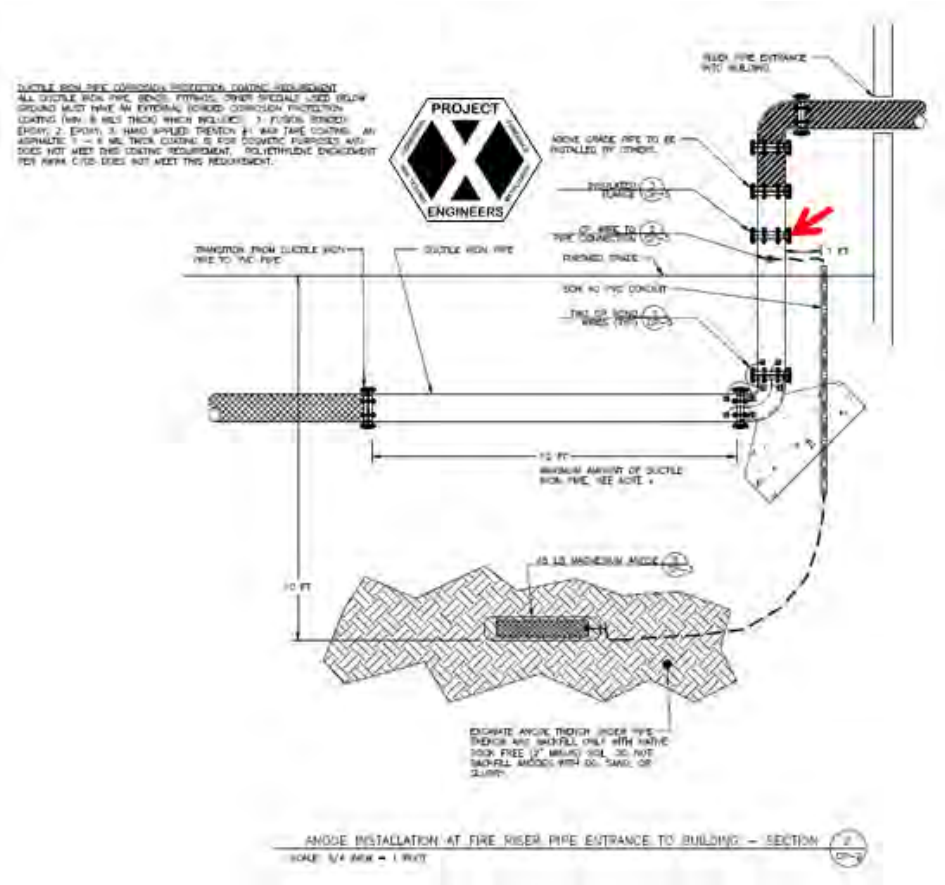

Figure 1- Fire Riser Detail: Install Isolation joint at red arrow

The corrosivity at this site is corrosive to steel. Any piping that must be jack bored should use abrasion resistant epoxy coating such as 3M Scotchkote 323, or PowercreteDD, or equivalent. The corrosion control options for this site are as follows:

1) Wax tape per AWWA C217, or
2) Coal tar enamel per AWWA C203, or
3) Fusion bonded epoxy per AWWA C213
4) And install cathodic protection system per NACE SP0169.

Or instead of CP and Dielectric coating

5) Use 5,000 psi cement designed per ACI 318-14 Chapter 19 Table 19.3.1.1 per C2 category which exceeds the exposure class for this project, or
6) For bare steel surfaces, such as welded pipe joints, apply 3 inch thick field coating of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide. (For CML&C pipes, CML&C factory applied 3/4 inch thick coating is equivalent and needs no extra thickness added.)

It is critical for the life of the pipe that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of

any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.8 Steel Fittings

The corrosivity at this site is very corrosive to steel. The corrosion control options for this site are as follows:

1) Apply impermeable dielectric coating such as minimum 10 mil thick polyethylene, or
2) Tape coating system per AWWA C214, or
3) Wax tape per AWWA C217, or
4) Coal tar enamel per AWWA C203, or
5) Fusion bonded epoxy per AWWA C213
6) And install cathodic protection system per NACE SP0169.

Or instead of CP and Dielectric coating

7) Apply 3 inch coating of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.9 Ductile Iron (DI) & Cast Iron Fittings

AWWA C105 developed a 10 point system to classify sites as aggressive or non-aggressive to ductile iron materials. The 10-point system does not, and was never intended to, quantify the corrosivity of a soil. It is a tool used to distinguish nonaggressive from aggressive soils relative to iron pipe. Soils <10 points are considered nonaggressive to iron pipe, whereas soils ≥10 points are considered aggressive. A 15 and a 20 point soil are both considered aggressive to iron pipe, however, because of the nature of the soil parameters measured, the 20 point soil may not necessarily be more aggressive than the 15 point soil. The criterion is based upon soil resistivities, soil drainage, pH, sulfide presence, and reduction-oxidation (REDOX) potential. The soil samples tested for this site resulted in a score of 17.5 out of 25.5. A score greater or

equal to 10 points classifies soils as aggressive to iron materials. The black coating on iron pipes is purely for aesthetic purposes and should not be relied upon for corrosion protection.[10]

The corrosivity at this site is very corrosive to iron. The corrosion control options for this site are as follows:

1) Apply impermeable dielectric coating such as minimum 10 mil thick polyethylene, or
2) Wax tape per AWWA C217, or
3) Coal tar enamel per AWWA C203, or
4) Fusion bonded epoxy per AWWA C213
5) And install cathodic protection system per NACE SP0169.

Or instead of CP and Dielectric coating

6) Apply 3 inch coating of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.10 Ductile Iron & Cast Iron Pipe

AWWA C105 developed a 10 point system to classify sites as aggressive or non-aggressive to ductile iron materials. The 10-point system does not, and was never intended to, quantify the corrosivity of a soil. It is a tool used to distinguish nonaggressive from aggressive soils relative to iron pipe. Soils <10 points are considered nonaggressive to iron pipe, whereas soils ≥10 points are considered aggressive. A 15 and a 20 point soil are both considered aggressive to iron pipe, however, because of the nature of the soil parameters measured, the 20 point soil may not necessarily be more aggressive than the 15 point soil. The criterion is based upon soil resistivities, soil drainage, pH, sulfide presence, and reduction-oxidation (REDOX) potential. The soil samples tested for this site resulted in a score of 17.5 out of 25.5. A score greater or equal to 10 points classifies soils as aggressive to iron materials. The black coating on iron pipes is purely for aesthetic purposes and should not be relied upon for corrosion protection.[11]

Though a site may not be corrosive in nature at the time of construction, **installation of corrosion test stations and electrical continuity joint bonding should be performed during construction** so that future corrosion inspections can be performed. If steel pipes with gasket joints or other possibly non-conductive type joints are installed, their joints should be bonded

[10] https://www.dipra.org/ductile-iron-pipe-resources/frequently-asked-questions/corrosion-control

[11] https://www.dipra.org/ductile-iron-pipe-resources/frequently-asked-questions/corrosion-control

across by welding or pin brazing a #8 AWG copper strand bond cable. Electrical continuity is necessary for corrosion inspections and for cathodic protection. **If using thermite, perform one test bond using a half-charge then pressure test to confirm excess heat and pinholes were not created.**

Pea gravel is used by plumbers to lay pipes and establish slopes. If the gravel has more than 200 ppm chlorides or is not tested, a 25 mil plastic should be placed between the gravel and pipe to avoid corrosion.

Corrosion test stations should be installed every 1,000 feet of pipeline.

Test stations shall have two #8 HMWPE copper strand wire test leads welded or pin brazed to the underground pipe, brought up into the test station hand hole and marked CTS. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

At isolation joints and pipe casings, 4 wire test stations shall be installed using #8 HMWPE copper strand wire test leads. Use different color wires to distinguish which wires are bonded to one side of isolation joint or to casing. Wires should be brought into test station hand hole at finished grade with 12 inches of wire coiled within test station.

Prevent dissimilar metal corrosion cells per NACE SP0286:

1) Electrically isolate dissimilar metal connections
2) Electrically isolate dissimilar coatings (Epoxy vs CML&C) segments connections
3) Electrically isolate river crossing segments
4) Electrically isolate freeway crossing segments
5) Electrically isolate old existing pipelines from new pipelines
6) Electrically isolate aboveground and underground pipe segments with flange isolation joint kits per NACE SP0286**. These are especially important for fire risers.**

The corrosivity at this site is corrosive to iron. The corrosion control options for this site are as follows:

1) Apply impermeable dielectric coating such as minimum 10 mil thick polyethylene, or
2) Wax tape per AWWA C217, or
3) Coal tar enamel per AWWA C203, or
4) Fusion bonded epoxy per AWWA C213
5) And install cathodic protection system per NACE SP0169.

Or instead of CP and Dielectric coating

6) Apply 3 inch coating of Type II cement or high pH slurry that will maintain pH higher than 12. Cement is both a corrosion inhibitor and a coating for ferrous metals. Cement naturally holds a pH of 12 or higher for many years if not exposed to high levels of carbon dioxide.

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of

any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.11 Copper Materials

Copper is an amphoteric material which is susceptible to corrosion at very high and very low pH. It is one of the most noble metals used in construction thus typically making it a cathode when connected to dissimilar metals. Copper's nobility can change with temperature, similar to the phenomenon in zinc. When zinc is at room temperature, it is less noble than steel and can provide cathodic protection to steel. But when zinc is at a temperature above 140F such as in a water heater, it becomes more noble than the steel and the steel becomes the sacrificial anode. This is why zinc is not used in steel water heaters or boilers. Cold copper has one native potential, but when heated it develops a more electronegative electro-potential aka open circuit potential. Thus hot and cold copper pipes should be electrically isolated from each other to avoid creation of a thermo-galvanic corrosion cell.

2.11.1 Copper Pipes

The lowest pH for this area was measured to be 8.0. Copper is greatly affected by pH, ammonia and nitrate concentrations[12]. The highest nitrate concentration was 421.0 mg/kg and the highest ammonia concentration was 9.4 mg/kg at this site.

These soils were determined to be corrosive to copper and copper alloys such as brass.

Aboveground, underground, cold water and hot water pipes should be electrically isolated from each other by use of dielectric unions and plastic in-wall pipe supports per NACE SP0286. The following are corrosion control options for underground copper water pipes.

1) Run copper pipes within PVC pipes to prevent soil contact, or
2) Cover piping with a 20 mil epoxy coating, or 8-mil polyethylene sleeve, or encase in double 4-mil thick polyethylene sleeves free of scratches and defects then backfill with clean sand with 2 inch minimum cover above and below tubing. Backfill should have a pH between 6 and 8 with electrical resistivity greater than 2,000 ohm-cm
3) Cover copper pipes with minimum 8 mil polyethylene sleeve or incase in double 4-mil thick polyethylene sleeves over a suitable primer and apply cathodic protection per NACE SP0169

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

[12] Corrosion Data Handbook, Table 6, Corrosion Resistance of copper alloys to various environments, 1995

2.11.2 Brass Fittings

Brass fittings should be electrically isolated from dissimilar metals by use of dielectric unions or isolation joint kits per NACE SP0286.

These soils were determined to be corrosive to copper and copper alloys such as brass.

The following are corrosion control options for underground brass.

1) Prevent soil contact by use of impermeable coating system such as wax tape, or
2) Prevent soil contact by use of a 20 mil epoxy coating free of scratches and defects and backfill with clean sand with 4 inch minimum cover above and below brass. Backfill should have a pH between 6 and 8 with electrical resistivity greater than 2,000 ohm-cm, or
3) Cover brass with minimum 10 mil polyethylene sleeve over a suitable primer and apply cathodic protection per NACE SP0169

It is critical for the life of the metal that the protective wrap contains no openings or holes. Prevent damage to the protective sleeve during backfilling of the pipe trench. Penetrations of any kind within these or other protective materials generally leads to accelerated corrosion failure due to the fact that the corrosion attack is concentrated at the location of these penetrations. Cathodic protection will protect these defects. The better the coating, the less expensive a cathodic protection system will be in anode material and power requirement if needed.

2.11.3 Bare Copper Grounding Wire

It is assumed that corrosion will occur at all sides of the bare wire, thus the corrosion rate is calculated as a two sided attack determining the time it takes for the corrosion from two sides to meet at the center of the wire. The estimated life of bare copper wire for this site is the following:[13]

Size (AWG)	**Diameter (mils)**	**Est. Time to penetration (Yrs)**
14	64.1	5.5
13	72	6.2
12	80.8	7.0
11	90.7	7.8
10	101.9	8.8
9	114.4	9.9
8	128.5	11.1
7	144.3	12.4
6	162	14.0
5	181.9	15.7
4	204.3	17.6
3	229.4	19.8
2	257.6	22.2

[13] Soil-Corrosion studies 1946 and 1948: Copper Alloys, Lead, and Zinc, Melvin Romanoff, National Bureau of Standards, Research Paper RP2077, 1950

Size (AWG)	Diameter (mils)	Est. Time to penetration (Yrs)
1	289.3	24.9

If the bare copper wire is being used as a grounding wire connected to less noble metals such as galvanized steel or carbon steel, the less noble metals will provide additional cathodic protection to the copper reducing the corrosion rate of the copper.

It is recommended that a corrosion inhibiting and water-repelling coating be applied to aboveground and belowground copper-to-dissimilar metal connections to reduce risk of dissimilar corrosion. This can be wax tape, or other epoxy coating.

Tinned copper wiring or laying copper wire in conductive concrete can protect against chemical attack in soils with high nitrates, ammonia, sulfide and severely low soil electrical resistivity.

2.12 Aluminum Pipe/Conduit/Fittings

Aluminum is an amphoteric material prone to pitting corrosion in environments that are very acidic or very alkaline or high in chlorides.

Conditions at this site are safe for aluminum.

Aluminum derives its corrosion resistance from its oxide layer which needs oxygen to regenerate if damaged, similar to stainless steels. Thus aluminum is not good for deep soil applications. Since aluminum corrodes at very alkaline environments, it cannot be encased or placed against cement or mortar such as brick wall mortar up against an aluminum window frame.

Aluminum is also very low on the galvanic series scale making it most likely to become a sacrificial anode when in contact with dissimilar metals in moist environments. Avoid electrical continuity with dissimilar metals by use of insulators, dielectric unions, or isolation joints per NACE SP0286. Pooling of water at post bottoms or surfaces should be avoided by integrating good drainage.

2.13 Carbon Fiber or Graphite Materials

Carbon fiber or other graphite materials are extremely noble on the galvanic series and should always be electrically isolated from dissimilar metals. They can conduct electricity and will create corrosion cells if placed in contact within a moist environment with any metal.

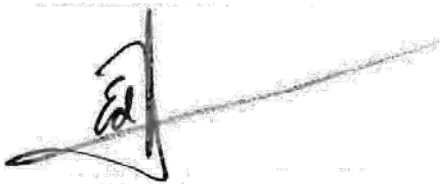
2.14 Plastic and Vitrified Clay Pipe

No special precautions are required for plastic and vitrified clay piping from a corrosion viewpoint.

Protect all metallic fittings and pipe restraining joints with wax tape per AWWA C217, cement if previously recommended, or epoxy.

3 CLOSURE

In addition to soils chemistry and resistivity, another contributing influence to the corrosion of buried metallic structures is stray electrical currents. These electrical currents flowing through the earth originate from buried electrical systems, grounding of electrical systems in residences, commercial buildings, and from high voltage overhead power grids. Therefore, it is imperative that the application of protective wraps and/or coatings and electrical isolation joints be properly applied and inspected.



It is the responsibility of the builder and/or contractor to closely monitor the installation of such materials requiring protection in order to assure that the protective wraps or coatings are not damaged.

The recommendations outlined herein are in conformance with current accepted standards of practice that meet or exceed the provisions of the Uniform Building Code (UBC), the International Building Code (IBC), California Building Code (CBC), the American Cement Institute (ACI), Nickel Institute, National Association of Corrosion Engineers (NACE International), Post-Tensioning Institute Guide Specifications and State of California Department of Transportation, Standard Specifications, American Water Works Association (AWWA) and the Ductile Iron Pipe Research Association (DIPRA).

Our services have been performed with the usual thoroughness and competence of the engineering profession. No other warranty or representation, either expressed or implied, is included or intended.

Please call if you have any questions.

Respectfully Submitted,

5 Corrosion Basics

In general, the corrosion rate of metals in soil depends on the electrical resistivity, the elemental composition, and the oxygen content of the soil. Soils can vary greatly from one acre to the next, especially at earthquake faults. The better a soil is for farming; the easier it will be for corrosion to take place. Expansive soils should be considered disturbed simply because of their nature from dry to wet seasons.

5.1 Pourbaix Diagram – In regards to a material's environment

All metals are unique and have a weakness. Some metals do not like acidic (low pH) environments. Some metals do not like alkaline (high pH) environments. Some metals don't like either high or low pH environments such as aluminum. These are called amphoteric materials. Some metals become passivated and do not corrode at high pH environments such as steel. These characteristics are documented in Marcel Pourbaix's book "Atlas of electrochemical equilibria in aqueous solutions"

In the mid 1900's, Marcel Pourbaix developed the Pourbaix diagram which describes a metal's reaction to an environment dependent on pH and voltage conditions. It describes when a metal remains passive (non-corroding) and in which conditions metals become soluble (corrode). Steels are passive in pH over 12 such as the condition when it is encased in cement. If the cement were to carbonate and its pH reduce to below 12, the cement would no longer be able to act as a corrosion inhibitor and the steel will begin to corrode when moist.

Some metals such as aluminum are amphoteric, meaning that they react with acids and bases. They can corrode in low pH and in high pH conditions. Aluminum alloys are generally passive within a pH of 4 and 8.5 but will corrode outside of those ranges. This is why aluminum cannot be embedded in cement and why brick mortar should not be laid against an aluminum window frame without a protective barrier between them.

5.2 Galvanic Series – In regards to dissimilar metal connections

All metals have a natural electrical potential. This electrical potential is measured using a high impedance voltmeter connected to the metal being tested and with the common lead connected to a copper copper-sulfate reference electrode (CSE) in water or soil. There are many types of reference electrodes. In laboratory measurements, a Standard Hydrogen Electrode (SHE) is commonly used. When different metal alloys are tested they can be ranked into an order from most noble (less corrosion), to least noble (more active corrosion). When a more noble metal is connected to a less noble metal, the less noble metal will become an anode and sacrifice itself through corrosion providing corrosion protection to the more noble metal. This hierarchy is known as the galvanic series named after Luigi Galvani whose experiments with electricity and muscles led Alessandro Volta to discover the reactions between dissimilar metals leading to the early battery. The greater the voltage difference between two metals, the faster the corrosion rate will be.

Table 1- Dissimilar Metal Corrosion Risk

	Zinc	Galvanized Steel	Aluminum	Cast Iron	Lead	Mild Steel	Tin	Copper	Stainless Steel

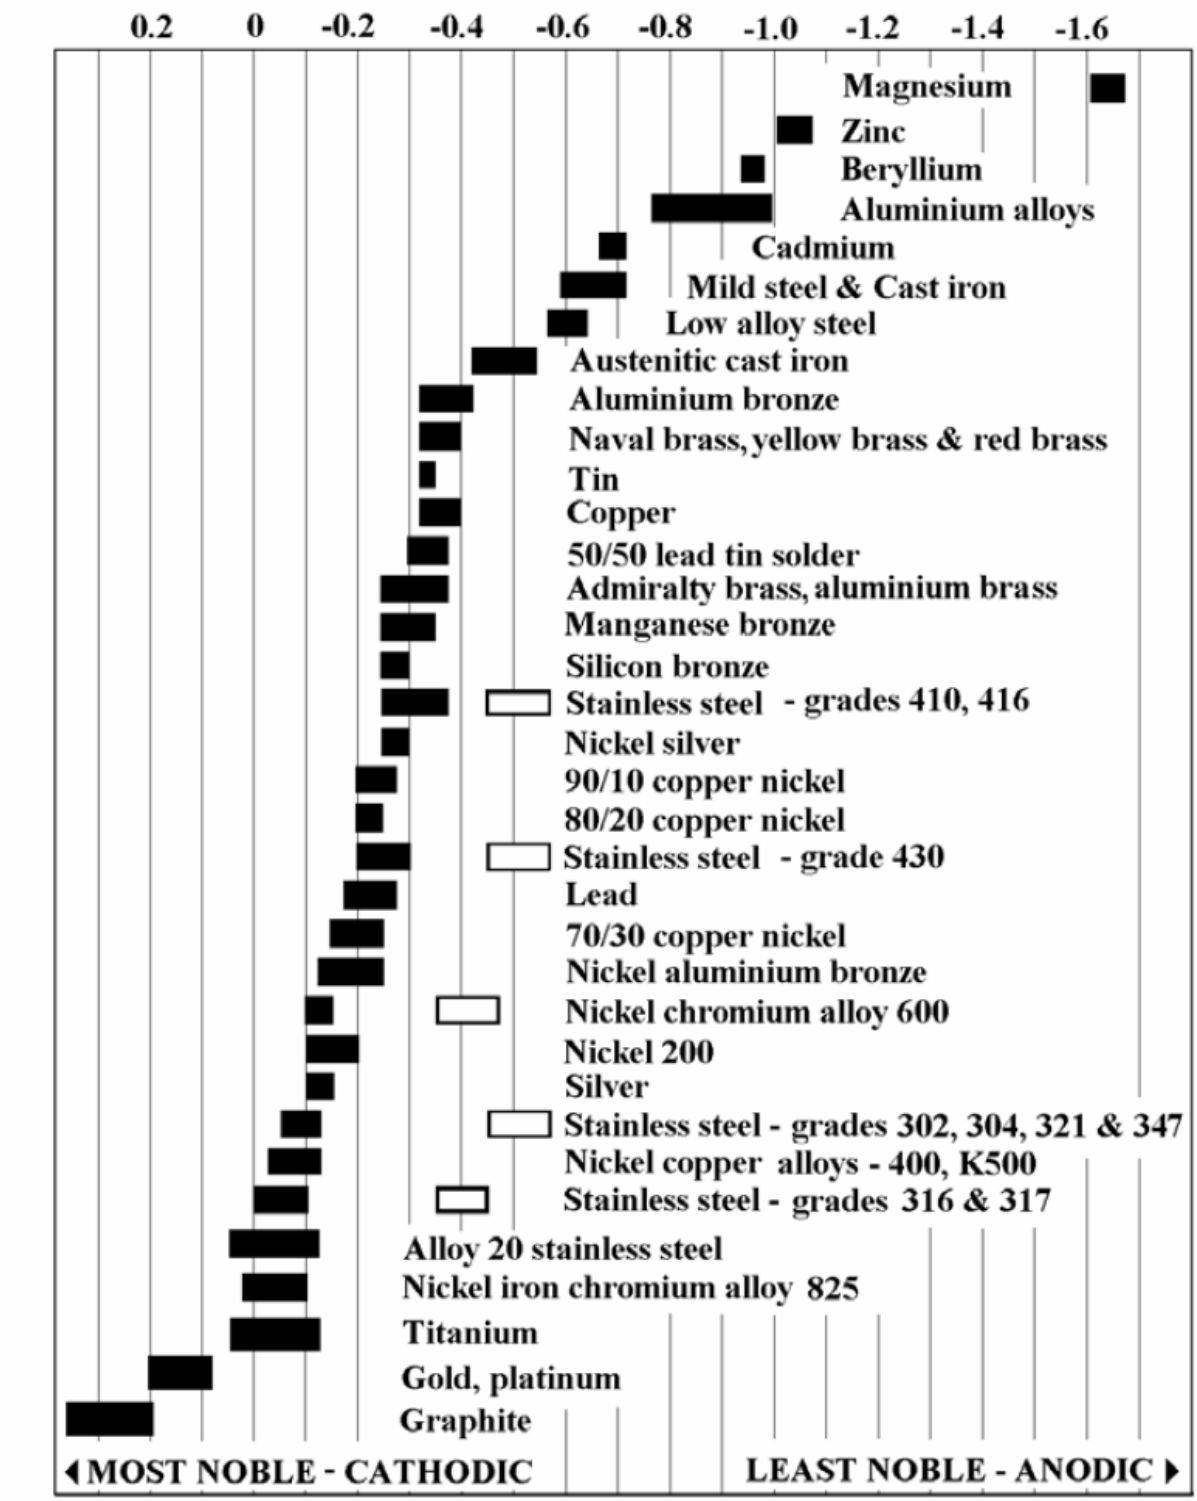
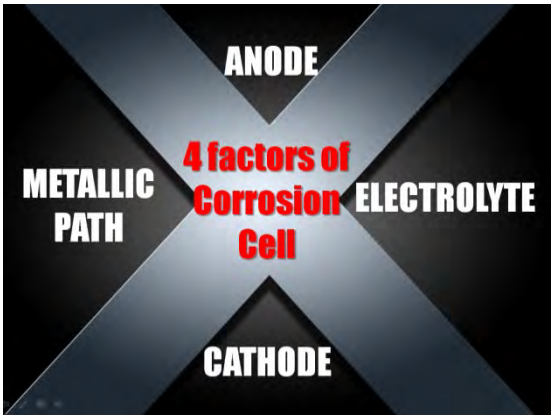
Tin	High	High	Medium	Low	Low	Low	None	Medium	Medium
Copper	High	High	High	Medium	Medium	Medium	Medium	None	Low
Stainless Steel	High	High	High	Medium	Medium	Medium	Medium	Low	None





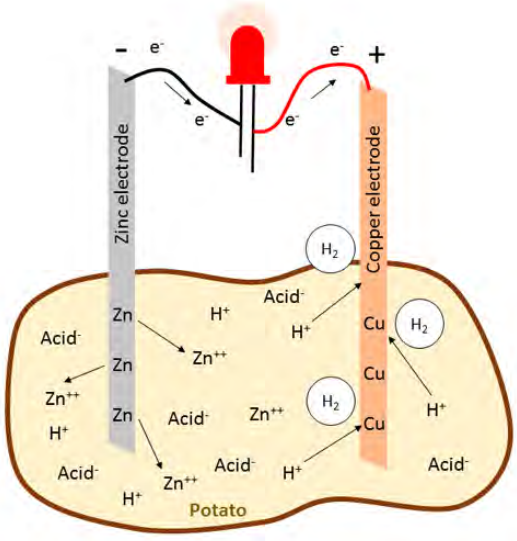


Figure 4 - Galvanic series of metals relative to CSE half cell.

5.3 Corrosion Cell

In order for corrosion to occur, four factors must be present. (1) The anode (2) the cathode (3) the electrolyte and (4) the metallic or conductive path joining the anode and the cathode. If any one of these is removed, corrosion activity will stop. This is how a simple battery produces electricity. An example of a non-metallic yet conductive material is graphite. Graphite is similar in nobility to gold. Do not connect graphite to anything in moist environments.

The anode is where the corrosion occurs, and the cathode is the corrosion free material. Sometimes the anode and cathode are different materials connected by a wire or union. Sometimes the anode and cathode are on the same pipe with one area of the pipe in a low oxygen zone while the other part of the pipe is in a high oxygen zone. A good example of this is a post in the ocean that is repeatedly splashed. Deep underwater, corrosion is minimal, but at the splash zone, the corrosion rate is greatest.

Low oxygen zones and crevices can also harbor corrosive bacteria which in moist environments will lead to corrosion. This is why pipes are laid on backfill instead of directly on native cut soil in a trench. Filling a trench slightly with backfill before installing pipe then finishing the backfill creates a uniform environment around the entire surface of the pipe.

The electrolyte is generally water, seawater, or moist soil which allows for the transfer of ions and electrical current. Pure water itself is not very conductive. It is when salts and minerals dissolve into pure water that it becomes a good conductor of electricity and chemical reactions. Metal ores are turned into metal alloys which we use in construction. They naturally want to return to their natural metal ore state but it requires energy to return to it. The corrosion cell, creates the energy needed to return a metal to its natural ore state.

The metallic or conductive path can be a wire or coupling. Examples are steel threaded into a copper joint, or an electrician grounding equipment to steel pipes inadvertently connecting electrical grid copper grounding systems to steel or iron underground pipes.

The ratio of surface area between the anode and the cathode is very important. If the anode is very large, and the cathode is very small, then the corrosion rate will be very small and the anode may live a long life. An example of this is when short copper laterals were connected to a large and long steel pipeline. The steel had plenty of surface area to spread the copper's attack, thus corrosion was not

noticeable. But if the copper was the large pipe and the steel the short laterals, the steel would corrode at an amazing rate.

5.4 Design Considerations to Avoid Corrosion

The following recommendations are based upon typical observations and conclusions made by forensic engineers in construction defect lawsuits and NACE International (Corrosion Society) recommendations.

5.4.1 Testing Soil Factors (Resistivity, pH, REDOX, SO, CL, NO3, NH3)

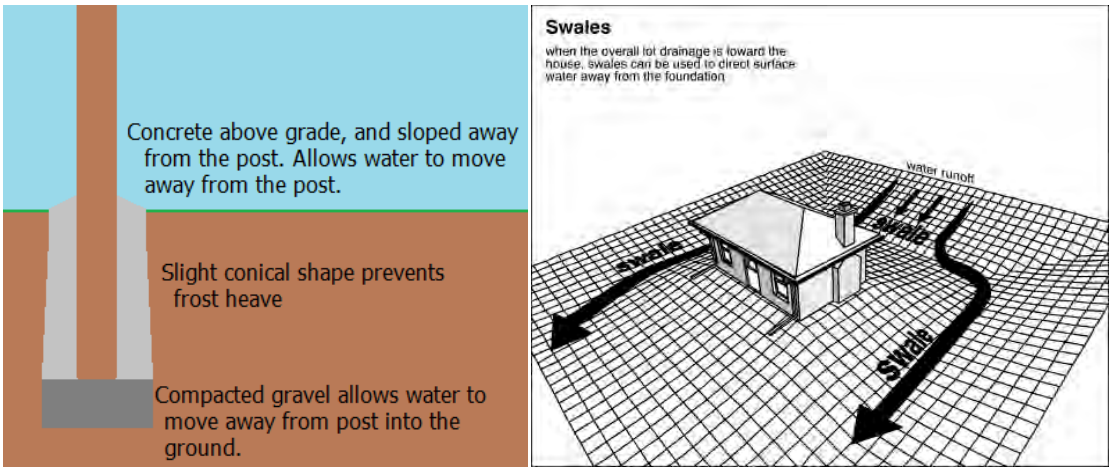
As previously mentioned, different factors can cause corrosion. The most useful and common test for categorizing a soil's corrosivity has been the measure of soil resistivity which is typically measured in units of (ohm-cm) by corrosion engineers and geologists. Soil resistivity is the ability of soil to conduct or resist electrical currents and ion transfer. The lower the soil resistivity, the more conductive and corrosive it is. The following are "generally" accepted categories but keep in mind, the question is not "Is my soil corrosive?", the question should be, "What is my soil corrosive to?" and to answer that question, soil resistivity and chemistry must be tested. Though **soil resistivity is a good corrosivity indicator for steel materials, high chlorides or other corrosive elements do not always lower soil resistivity, thus if you don't test for chlorides and other water soluble salts, you can get an unpleasant surprise.** The largest contributing factor to a soil's electrical resistivity is its clay, mineral, metal, or sand make-up.

Table 2 - Corrosion Basics- An Introduction, NACE, 1984, pg 191

(Ohm-cm)	Corrosivity Description
0-500	Very Corrosive
500-1,000	Corrosive
1,000-2,000	Moderately Corrosive
2,000-10,000	Mildly Corrosive
Above 10,000	Progressively less corrosive

Testing a soil's pH provides information to reference the Pourbaix diagram of specific metals. Some elements such as ammonia and nitrates can create localized alkaline conditions which will greatly affect amphoteric materials such as aluminum and copper alloys.

Excess sulfates can break-down the structural integrity of cement and high concentrations of chlorides can overcome cement's corrosion inhibiting effect on encased ferrous metals and break down protective passivated surface layers on stainless steels and aluminum.



Corrosive bacteria are everywhere but can multiply significantly in anaerobic conditions with plentiful sulfates. The bacteria themselves do not eat the metal but their by-products can form corrosive sulfuric acids. The probability of corrosive bacteria is tested by measuring a soil's oxidation-reduction (REDOX) electro-potential and by testing for the presence of sulfides.

Only by testing a soil's chemistry for minimum resistivity, pH, chlorides, sulfates, sulfides, ammonia, nitrate, and redox potential can one have the information to evaluate the corrosion risk to construction materials such as steel, stainless steel, galvanized steel, iron, copper, brass, aluminum, and concrete.

5.4.2 Proper Drainage

It cannot be emphasized enough that pooled stagnant water on metals will eventually lead to corrosion. This stands for internal corrosion and external corrosion situations. In soils, providing good drainage will lower soil moisture content reducing corrosion rates. Attention to properly sealing polyethylene wraps around valves and piping will avoid water intrusion which would allow water to pool against metals. Above ground structures should not have cupped or flat surfaces that will pond water after rain or irrigation events.

Buildings typically are built on pads and have swales when constructed to drain water away from buildings directing it towards an acceptable exit point such as a driveway where it continues draining to a local storm drain. Many homeowners, landscapers and flatwork contractors appear to not be aware of this and destroy swales during remodeling. The majority of garage floor and finished grade elevations are governed by drainage during design.[14,15]

5.4.3 Avoiding Crevices

Crevices are excellent locations for oxygen differential induced corrosion cells to begin. Crevices can also harbor corrosive bacteria even in the most chemically treated waters. Crevices will also gather salts. If water's total alkalinity is low, its ability to maintain a stable pH can also become more difficult within a crevice allowing the pH to drop to acidic levels continuing a pitting process. Welds in extremely corrosive environments should be complete and well filleted without sharp edges to avoid crevices. Sharp edges should be avoided to allow uniform coating of protective epoxy. Detection of crevices in welds should be treated immediately. If pressures and loads are low, sanding and rewelding or epoxy patching can be suitable repairs. Damaged coatings can usually be repaired with Direct to Metal paints. **Scratches and crevice corrosion are like infections, they should not be left to fester or the infection will spread making things worse.**

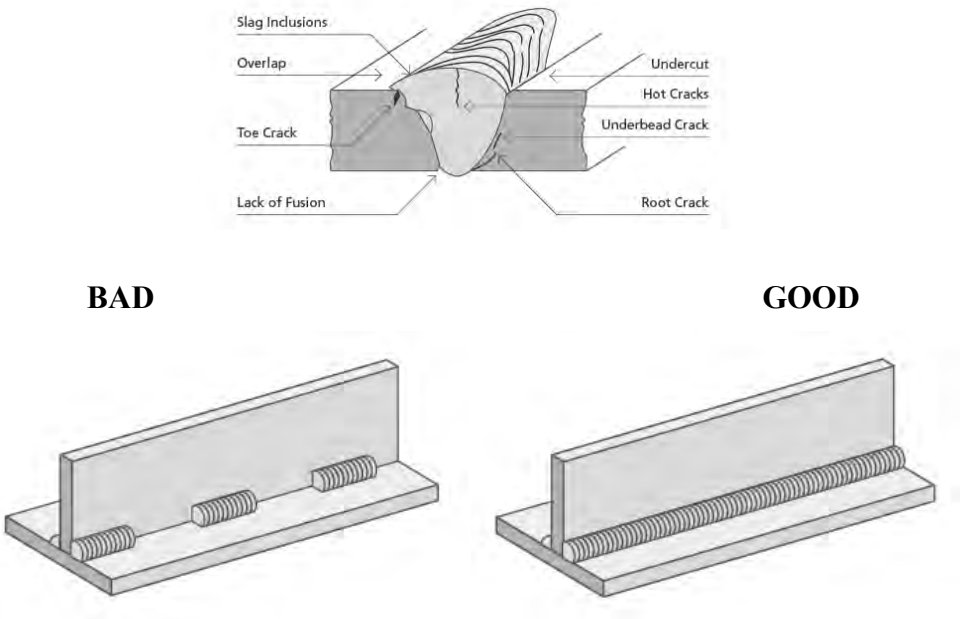

Figure 5 Defects which form weld crevices[16]

5.4.4 Coatings and Cathodic Protection

When faced with a corrosive environment, the best defense against corrosion is removing the electrolyte from the corrosion cell by applying coatings to separate the metal from the soil. During construction and installation, there is always some scratch or damage made to a coating. NACE training recommends that coatings be used as a first line of defense and that sacrificial or impressed current cathodic protection is used as a 2nd line of defense to protect the scratched areas. Use of a good coating dramatically reduces the amount of anodes a CP system would need. If CP is not installed as a 2nd line of defense in an extremely corrosive environment, the small scratched zones will suffer accelerated corrosion. CP details such as anode installation instructions must be designed by corrosion engineers or vessel manufacturers on a per project basis because it depends on electrolyte resistivity, surface area of infrastructure to be protected, and system geometry.

There are two types of cathodic protection systems, a Galvanic Anode Cathodic Protection (GACP) system and an Impressed Current Cathodic Protection (ICCP) system. A Galvanic Anode Cathodic Protection (GACP) system is simpler to install and maintain than an Impressed Current Cathodic Protection (ICCP) system. To protect the metals, they must all be electrically continuous to each other. In a GACP system, sacrificial zinc or magnesium anodes are then buried at locations per the CP design and connected by wire to a structure at various points in system. At the connection points, a wire connecting to the structure and the wire from the anode are joined in a Cathodic Protection Test Station hand hole which looks similar in size and shape to an irrigation valve pull box. By coating the underground structures, one can reduce the number of anodes needed to provide cathodic protection by 80% in many instances.

An ICCP system requires a power source, a rectifier, significantly more trenching, and more expensive type anodes. These systems are typically specified when bare metal is requiring protection

[16] http://www.daroproducts.co.uk/makes-good-weld/

in severely corrosive environments in which galvanic anodes do not provide enough power to polarize infrastructure to -850 mV structure-to-soil potential or be able to create a 100 mV potential shift as required by NACE SP169 to control corrosion. In severely corrosive environments, a GACP system simply may not last a required lifetime due to the high rate of consumption of the sacrificial anodes. ICCP system rectifiers must be inspected and adjusted quarterly or at a minimum bi-annually per NACE recommendations. Different anode installations may be possible but for large sites, anodes are placed evenly throughout the site and all anode wires must be trenched to the rectifier. For a large site, it may be beneficial to use two or more rectifiers to reduce wire lengths or trenching.

To simplify, a GACP system can be installed and practically forgotten with minor trenching because the anodes can be installed very close to the structures. An ICCP system must be inspected annually and anode wires run back to the rectifier which itself connects to the pile system. If any type of trenching or development is expected to occur at the site during the life of the site, it is a good idea to inspect the anode connections once a year to make sure wires are not cut and that the infrastructure is still being provided adequate protection. A common situation that occurs with ICCP systems is that a contractor accidently cuts the wires during construction then reconnects them incorrectly, turning the once cathode, into a sacrificing anode.

Design of a cathodic protection system protecting against soil side corrosion requires that Wenner Four Pin ground resistance measurements per ASTM G57 be performed by corrosion engineers at various locations of the site to determine the best depths and locations for anode installations. Ideally, a sample pile is installed and experiments determining current requirement are conducted. Using this data, the decision is made whether a GACP system is feasible or if an ICCP must be used.

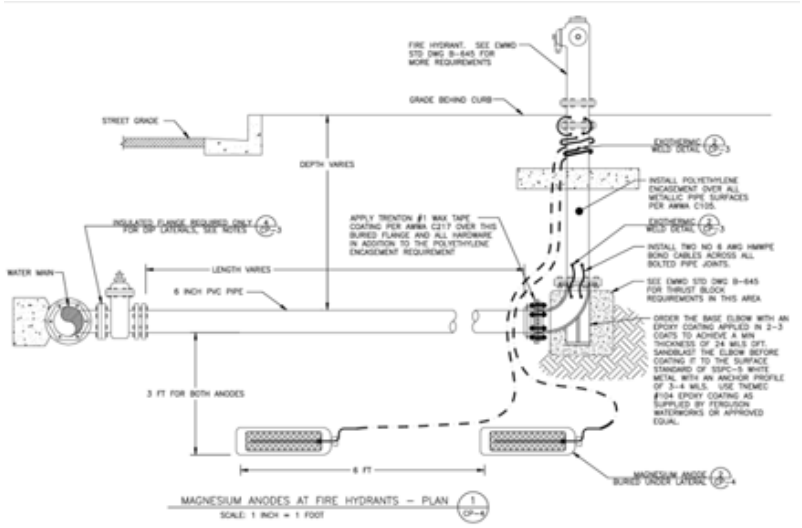

Figure 6 Sample anode design for fire hydrant underground piping

Vessels such as water tanks will have protective interior coatings and anodes to protect the interior surfaces. Anodes can also be buried on site and connected to system skid supports to protect the metal in contact with soil. A good example of a vessel cathodic protection system exists in all home water heaters which contain sacrificial aluminum or magnesium anodes. In environments that exceed 140F, zinc anodes cannot be used with carbon steel because they become the aggressor (Cathodic) to

the steel instead of sacrificial (anodic). Anodes in vessels containing extremely brackish water with chloride levels over 2,000 ppm should inspect or change out their anodes every 6 months.

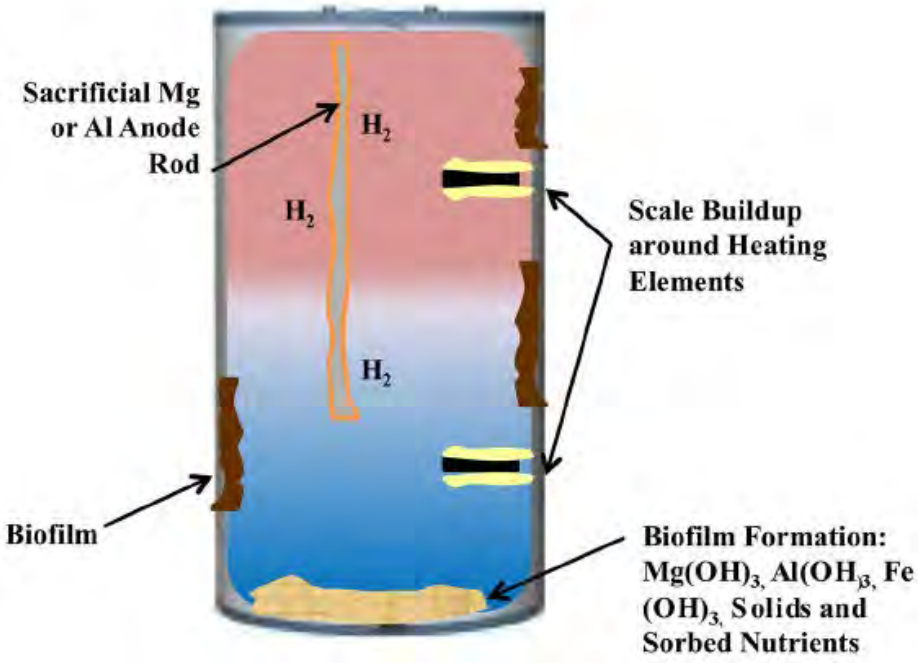

Figure 7 Cross section of boiler with anode

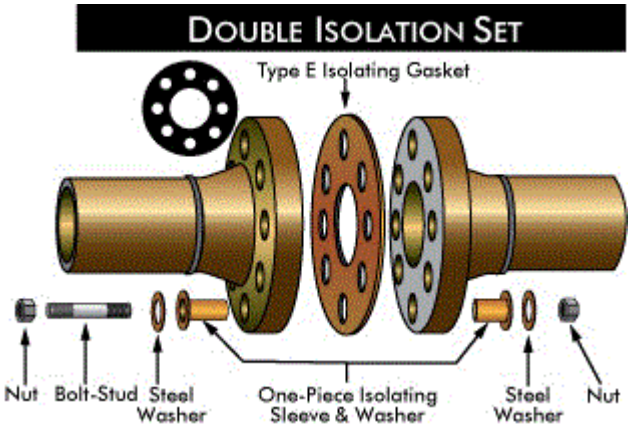
Cathodic protection can only protect a few diameters within a pipeline thus it is not recommended for small diameter pipelines and tubing internal corrosion protection. Anodes are like a lamp shining light in a room. They can only protect along their line of sight.



5.4.5 Good Electrical Continuity

In order for cathodic protection to protect a long pipeline or system of pipes from external soil side corrosion, they must all be electrically continuous to each other so that the electric current from the anode can travel along the pipes, then return through the earth to the anode. Electrical continuity is achieved by welding or pin brazing #8 AWG copper strand bond cable to the end of pipe sticks which have rubber gaskets at bell and spigots. If steel pipes are joined by full weld, bonding wires are not needed.

Electrical continuity between dissimilar metals is not desirable. Isolation joints or di-electric unions should be installed between dissimilar metals, such as steel pipes connecting to a brass valve per NACE SP0286. Bonding wires should then be welded onto the steel pipes by-passing the brass valve so that the cathodic protection system's current can continue to travel along the steel piping but isolate the brass valve from the steel pipeline. Another option would be to provide a separate cathodic protection system for steel pipes on both sides of the brass valve.

Typically, water heater inlets and outlets, gas meters and water meters have dielectric unions installed in them to separate utility property from homeowner property. This also protects them in the case that a home owner somehow electrically connects water pipes or gas pipes to a neighborhood electrical grounding system which can potentially have less noble steel in soil now connected to much

more noble copper in soil which will then create a corrosion cell. This is exactly how a lemon powered clock works when a galvanized zinc nail and a steel nail are inserted into a lemon then connected to a clock. The clock is powered by the corrosion cell created.

5.4.6 Bad Electrical Continuity

Bad electrical continuity is when two different materials or systems are made electrically continuous (aka shorted) when they were not designed to be electrically continuous. Examples of this would be when gas lines are shorted to water lines or to electrical grounding beds. Very often, fire risers are shorted to electrical grounding systems, and water pipes at business parks. Since fire risers usually have a very short ductile iron pipe in the ground which connects to PVC pipe systems, they tend to experience leaks after 7 to 10 years of being attacked by underground copper systems.

It is absolutely imperative that any copper water piping or other metal conduits penetrating cement slab or footings, not come in contact with the reinforcing steel or post-tensioning tendons to avoid creation of galvanic corrosion cells.

5.4.7 Corrosion Test Stations

Corrosion test stations should be installed every 1,000 feet along pipelines in order to measure corrosion activity in the future. For a simple pipeline, two #8 AWG copper strand bond cable welded or pin brazed onto the pipeline are run up to finished grade and left in a hand hole. Corrosion test stations are used to measure pipe-to-soil electro potential relative to a copper copper-sulfate reference electrode to determine if the pipe is experiencing significant corrosion activity. By measuring test stations along a pipeline, hot spots can be determined, if any. The wires also allow for electrical continuity testing, condition assessment, and a multitude of other types of tests.

At isolation joints and pipe casings, two wires should be welded to either side of the isolation joint for a total of 4 wires to be brought up to the hand hole. This allows for future tests of the isolation joint, casing separation confirmation, and pipe-to-soil potential readings during corrosion surveys.

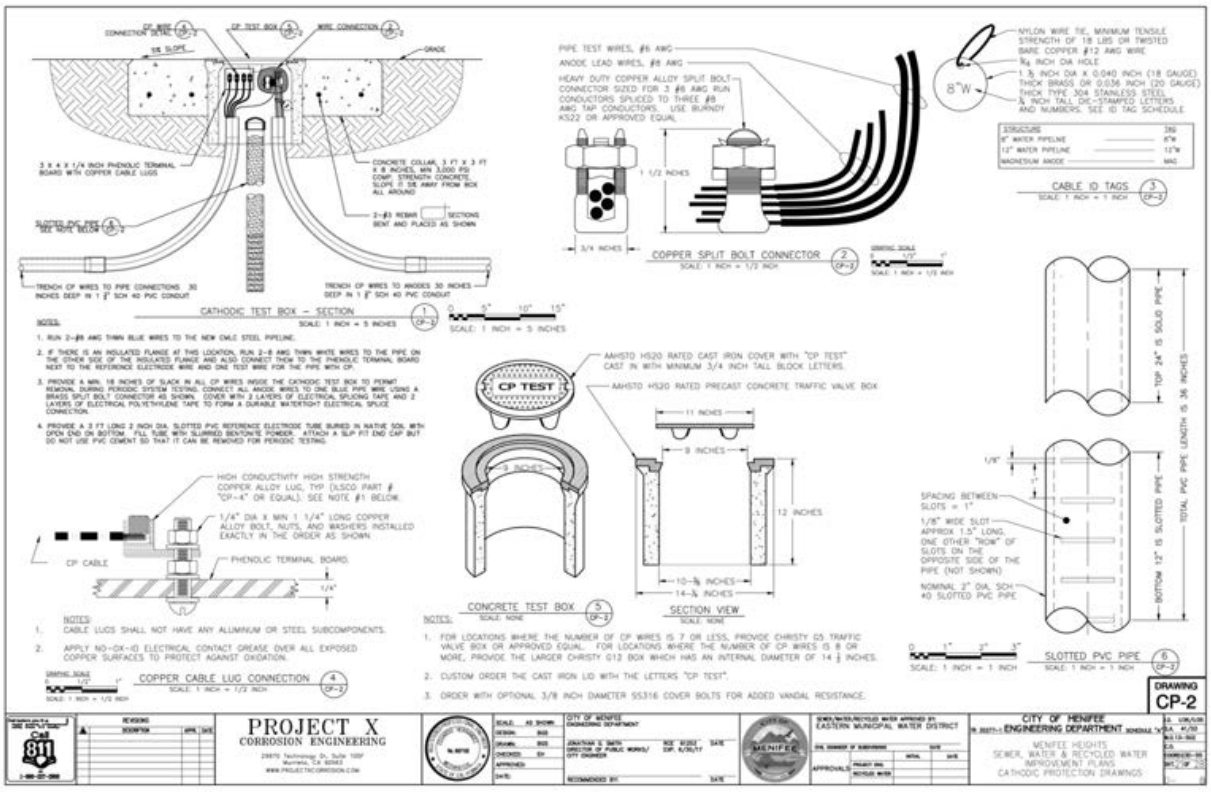


Figure 8 Sample of corrosion test station specification drawing

5.4.8 Excess Flux in Plumbing

Investigations of internal corrosion of domestic water plumbing systems almost always finds excess flux to be the cause of internal pitting of copper pipes. Some people believe that there is no such thing as too much flux. Flux runs have been observed to travel up to 20 feet with pitting occurring along the flux run. Flushing a soldered plumbing system with hot water for 15 minutes can remove significant amounts of excess flux left in the pipes. If a plumbing system is expected to be stagnant for some time, it should be drained to avoid stagnant water conditions that can lead to pitting and dezincification of yellow brasses.

5.4.9 Landscapers and Irrigation Sprinkler Systems

A significant amount of corrosion of fences is due to landscaper tools scratching fence coatings and irrigation sprinklers spraying these damaged fences. Recycled water typically has a higher salt content than potable drinking water, meaning that it is more corrosive than regular tap water. The same risk from damage and water spray exists for above ground pipe valves and backflow preventers. Fiber glass covers, cages, and cement footings have worked well to keep tools at an arm's length.

5.4.10 Roof Drainage splash zones

Unbelievably, even the location where your roof drain splashes down can matter. We have seen drainage from a home's roof valley fall directly down onto a gas meter causing it's piping to corrode at an accelerated rate reaching 50% wall thickness within 4 years. It is the same effect as a splash

zone in the ocean or in a pool which has a lot of oxygen and agitation that can remove material as it corrodes.

5.4.11 Stray Current Sources

Stray currents which cause material loss when jumping off of metals may originate from direct-current distribution lines, substations, or street railway systems, etc., and flow into a pipe system or other steel structure. Alternating currents may occasionally cause corrosion. The corrosion resulting from stray currents (external sources) is similar to that from galvanic cells (which generate their own current) but different remedial measures may be indicated. In the electrolyte and at the metal-electrolyte interfaces, chemical and electrical reactions occur and are the same as those in the galvanic cell; specifically, the corroding metal is again considered to be the anode from which current leaves to flow to the cathode. Soil and water characteristics affect the corrosion rate in the same manner as with galvanic-type corrosion.

However, stray current strengths may be much higher than those produced by galvanic cells and, as a consequence, corrosion may be much more rapid. Another difference between galvanic-type currents and stray currents is that the latter are more likely to operate over long distances since the anode and cathode are more likely to be remotely separated from one another. Seeking the path of least resistance, the stray current from a foreign installation may travel along a pipeline causing severe corrosion where it leaves the line. Knowing when stray currents are present becomes highly important when remedial measures are undertaken since a simple sacrificial anode system is likely to be ineffectual in preventing corrosion under such circumstances.[17] Stray currents can be avoided by installing proper electrical shielding, installation of isolation joints, or installation of sacrificial jump off anodes at crossings near protected structures such as metal gas pipelines or electrical feeders.

U.S. Geological Survey - Earthquake Hazards Program

Unified Hazard Tool

Please do not use this tool to obtain ground motion parameter values for the design code reference documents covered by the U.S. Seismic Design Maps web tools (e.g., the International Building Code and the ASCE 7 or 41 Standard). The values returned by the two applications are not identical.

Site-Specific MCE_R & Design Response Spectral Accelerations

Important Note

The site-specific, design response spectral acceleration, Sa, returned by this tool for user-specified inputs, must be compared to the minimum Sa requirement described in Section 21.3 of ASCE 7-16 (second and third paragraphs). This minimum Sa is computed as 80% of the design response spectrum derived from the SDS, SD1, and TL values obtained from the ASCE tool at https://asce7hazardtool.online/. The larger of the site-specific Sa and the 80% minimum Sa at each period, T, is the final design response spectral acceleration. This final Sa x 1.5 is the final MCER response spectral acceleration.

About UGMS

The UGMS MCER tool was developed by the SCEC Committee for Utilization of Ground Motion Simulations (or "UGMS Committee") from research supported by the Southern California Earthquake Center (SCEC). SCEC is funded by NSF Cooperative Agreement EAR-1033462 & USGS Cooperative Agreement G12AC20038. For more information on the UGMS Committee, visit https://www.scec.org/research/ugms.

SC

Silt Correction:
$K=(1-FC)^{0.75}$

Earthquake & Groundwater Information:
Magnitude = 6.57
Max. Acceleration = 0.648 g
Project GW = 10 ft
Maximum Settlement = 0.69 in
Settl. at Bottom of Footing = 0.69 in

Liquefaction: Boulanger & Idriss (2010-16)
Settl.: [dry] Pradel (1998); [sat] Idriss & Boulanger (2008)
Lateral spreading: Idriss & Boulanger (2008)
M correction: [Sand; Clay] Boulanger & Idriss(2004)
σv correction: Idriss & Boulanger (2008)
Stress reduction: Idriss & Boulanger (2008)

Sensitive fine grained
Organic soils - peats
Clay to silty clay
Silty clay to clayey silt
Sandy silt to silty sand
Silty sand to clean sand
Dense sand to gravelly sand
Clayey sand to very stiff sand
Very stiff fine grained *

* Overconsolidated or cemented

Silt Correction:
$K=(1\text{-}FC)^{0.75}$

Earthquake & Groundwater Information:
Magnitude = 6.51
Max. Acceleration = 0.648 g
Project GW = 10 ft
Maximum Settlement = 0.14 in
Settl. at Bottom of Footing = 0.14 in

Liquefaction: Boulanger & Idriss (2010-16)
Settl.: [dry] Pradel (1998); [sat] Idriss & Boulanger (2008)
Lateral spreading: Idriss & Boulanger (2008)
M correction: [Sand; Clay] Boulanger & Idriss(2004)
σv correction: Idriss & Boulanger (2008)
Stress reduction: Idriss & Boulanger (2008)

GORIAN & ASSOCIATES, INC

Seismic Settlement Potential - CPT Data

Sensitive fine grained
Organic soils - peats
Clay to silty clay
Silty clay to clayey silt
Sandy silt to silty sand
Silty sand to clean sand
Dense sand to gravelly sand
Clayey sand to very stiff sand
Very stiff fine grained *

* Overconsolidated or cemented

Silt Correction:
$K=(1\text{-}FC)^{0.75}$

Earthquake & Groundwater Information:
Magnitude = 6.51
Max. Acceleration = 0.648 g
Project GW = 10 ft
Maximum Settlement = 0.42 in
Settl. at Bottom of Footing = 0.42 in

Liquefaction: Boulanger & Idriss (2010-16)
Settl.: [dry] Pradel (1998); [sat] Idriss & Boulanger (2008)
Lateral spreading: Idriss & Boulanger (2008)
M correction: [Sand; Clay] Boulanger & Idriss(2004)
σv correction: Idriss & Boulanger (2008)
Stress reduction: Idriss & Boulanger (2008)

GORIAN & ASSOCIATES, INC

Seismic Settlement Potential - CPT Data

- Sensitive fine grained
- Organic soils - peats
- Clay to silty clay
- Silty clay to clayey silt
- Sandy silt to silty sand
- Silty sand to clean sand
- Dense sand to gravelly sand
- Clayey sand to very stiff sand
- Very stiff fine grained *

* Overconsolidated or cemented

Silt Correction:
$K=(1\text{-}FC)^{0.75}$

Earthquake & Groundwater Information:
Magnitude = 6.51
Max. Acceleration = 0.648 g
Project GW = 10 ft
Maximum Settlement = 0.24 in
Settl. at Bottom of Footing = 0.24 in

Liquefaction: Boulanger & Idriss (2010-16)
Settl.: [dry] Pradel (1998); [sat] Idriss & Boulanger (2008)
Lateral spreading: Idriss & Boulanger (2008)
M correction: [Sand; Clay] Boulanger & Idriss(2004)
σv correction: Idriss & Boulanger (2008)
Stress reduction: Idriss & Boulanger (2008)

- Sensitive fine grained
- Organic soils - peats
- Clay to silty clay
- Silty clay to clayey silt
- Sandy silt to silty sand
- Silty sand to clean sand
- Dense sand to gravelly sand
- Clayey sand to very stiff sand
- Very stiff fine grained *

* Overconsolidated or cemented

Silt Correction:
$K=(1-FC)^{0.75}$

Earthquake & Groundwater Information:
Magnitude = 6.51
Max. Acceleration = 0.648 g
Project GW = 10 ft
Maximum Settlement = 1.12 in
Settl. at Bottom of Footing = 1.12 in

Liquefaction: Boulanger & Idriss (2010-16)
Settl.: [dry] Pradel (1998); [sat] Idriss & Boulanger (2008)
Lateral spreading: Idriss & Boulanger (2008)
M correction: [Sand; Clay] Boulanger & Idriss(2004)
σv correction: Idriss & Boulanger (2008)
Stress reduction: Idriss & Boulanger (2008)

- Sensitive fine grained
- Organic soils - peats
- Clay to silty clay
- Silty clay to clayey silt
- Sandy silt to silty sand
- Silty sand to clean sand
- Dense sand to gravelly sand
- Clayey sand to very stiff sand
- Very stiff fine grained *

* Overconsolidated or cemented

Silt Correction:
$K=(1\text{-}FC)^{0.75}$

Earthquake & Groundwater Information:
Magnitude = 6.51
Max. Acceleration = 0.648 g
Project GW = 10 ft
Maximum Settlement = 0.25 in
Settl. at Bottom of Footing = 0.25 in

Liquefaction: Boulanger & Idriss (2010-16)
Settl.: [dry] Pradel (1998); [sat] Idriss & Boulanger (2008)
Lateral spreading: Idriss & Boulanger (2008)
M correction: [Sand; Clay] Boulanger & Idriss(2004)
σv correction: Idriss & Boulanger (2008)
Stress reduction: Idriss & Boulanger (2008)

Sensitive fine grained
Organic soils - peats
Clay to silty clay
Silty clay to clayey silt
Sandy silt to silty sand
Silty sand to clean sand
Dense sand to gravelly sand
Clayey sand to very stiff sand
Very stiff fine grained *

* Overconsolidated or cemented

Silt Correction:
$K=(1-FC)^{0.75}$

Earthquake & Groundwater Information:
Magnitude = 6.51
Max. Acceleration = 0.648 g
Project GW = 10 ft
Maximum Settlement = 0.21 in
Settl. at Bottom of Footing = 0.21 in

Liquefaction: Boulanger & Idriss (2010-16)
Settl.: [dry] Pradel (1998); [sat] Idriss & Boulanger (2008)
Lateral spreading: Idriss & Boulanger (2008)
M correction: [Sand; Clay] Boulanger & Idriss(2004)
σv correction: Idriss & Boulanger (2008)
Stress reduction: Idriss & Boulanger (2008)

GORIAN & ASSOCIATES, INC

Seismic Settlement Potential - CPT Data

SUBJECT: **CANOGA PARK HIGH SCHOOL**
MAJOR MODERNIZATION (COLIN ID: 10372109)
PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT

This correspondence has been prepared by the Office of Environmental Health and Safety (OEHS) to document the suitability of the attached February 18, 2019 *PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT •FINAL• Canoga Park High School*, prepared by Eco & Associates, (the "Report") to guide future soil investigations associated with the Major Modification project at Canoga Park High School, 6850 Topanga Canyon Blvd., Canoga Park, CA 91303 (the "Site"). This determination is supported by the following:

- The Report states "Significant data gaps were not identified during the preparation of this Phase I ESA" [Environmental Site Assessment],
- Use of Site has not changed (i.e. still a school) since the creation of the Report, and
- Robust online sources (e.g. GeoTracker, EnviroStor, CERS, etc.) allow any significant environmental changes to off-site properties to be readily identified.

Should you have any questions or concerns regarding this correspondence, please contact Eric Longenecker at (805) 630-0633 or at eric.longenecker@lausd.net.

EXECUTIVE SUMMARY

Eco & Associates, Inc. (Eco) was retained by the Los Angeles Unified School District (LAUSD) to perform this Phase I Environmental Site Assessment (ESA) for the Canoga Park High School property located at 6850 Topanga Canyon Boulevard, Canoga Park, CA (hereafter, the "Site"). This Phase I ESA was conducted in general conformance with the scope and limitations of ASTM International, Standard E1527-13 (hereafter, ASTM E1527-13). The purpose of this assessment was to determine if recognized environmental conditions (RECs) were present within the Site. RECs are the presence, or likely presence, of hazardous material releases within a property. A review of the site conditions at the time of this assessment, the Site's background, and a summary of potential RECs at the Site are provided below.

SITE DESCRIPTION

At the time of this assessment, the Site was occupied by the Canoga Park High School, as part of the LAUSD. The school's buildings are mostly located on the Site's western side. The main building is two stories in height and of wood-frame construction with stucco exterior walls. The offices and classrooms within the building contained typical office and school furnishings.

Multiple buildings in the Site's western portion were being utilized as classrooms, workrooms, gymnasiums, an assembly hall, a cafeteria, and storage/utility rooms. These buildings were generally adjoined by asphalt pavement, landscaped areas, and athletic grounds. The asphalt-paved athletic ground areas had painted court lines and basketball hoops. There was also a baseball field and an athletic track with a grassy central field.

FINDINGS AND CONCLUSIONS

Historical Site Information:

Based on data collected during this assessment, the Site was undeveloped and vacant up to approximately 1914. In 1915, the Site was developed as Owensmouth High School with a single relatively large building (main classroom and administration building) located on the northwestern part of the property. Since 1931, the school has been referred to as Canoga Park High School.

In 1928, the school was comprised of a relatively large main building (main classroom and administration building) and three smaller buildings south of the main building located in the Site's northwestern portion including the Girls Gym building. The eastern half of the Site was primarily open land, with an agricultural grove in the southeast portion, and Bell Creek and Calabasas Creek, both creeks flowing toward the east. Between 1928 and 1938, two additional large school buildings, facing Topanga Canyon Boulevard and used as administration and for classrooms, were added in the southwest portion of the Site. Within that same period, the oval athletic track was moved to its current location in the central portion of the east half of the Site.

In 1939, the assembly hall was added on the Site's southwestern portion. Between 1952 and 1959, the original large school building and another small building, located in the northwest portion of the Site, were removed and converted to an athletic field. Between 1954 and 1958, the Cafeteria, the Boys Physical Education building, Class Room Building (Clrm Bldg) #2, Shop #2, and four storage buildings

located south of the oval athletic track field were added. In 1960 and 1968, Clrm Bldg #3, the Music Building, Storage Unit Building #014DOP, and Clrm Bldg #4 were added.

During the period between 1974 and 1979, a major remodeling occurred that included removal of the two large main school buildings located on the southwest portion of the Site facing Topanga Canyon Boulevard as well as the cement concrete walks connecting the buildings. These were replaced by two other large buildings referred to as building Unit #1 and building Unit #2.

Historic Recognized Environmental Conditions:

Based on a review of properties within the site vicinity and data made available during this assessment, there is a limited potential that contaminants from off-Site properties have impacted the soil or groundwater underlying the Site.

Four adjacent properties were found to be Historic Recognized Environmental Conditions (HRECs) for the subject Site:

1. **Former Thrifty Oil Station located at 6851 Topanga Canyon Blvd., Canoga Park, CA.** This property, located 139 feet west-southwest of the Site, reported a leaking UST in 1990. The property was subsequently remediated by soil excavation, soil-vapor extraction, and groundwater extraction. The case was closed in 2010 by the LARWQCB because the groundwater plume was stable and the subsurface lithology (tight silt and clay) limited the migration of contaminants. Only methyl-tert-butyl ether (MTBE) was detected in two monitoring wells (MW9 and MW10), as late as 2007and due to these factors, this property is considered an HREC for the Site.

2. **Topanga Car Wash located at 6829 Topanga Canyon Blvd., Canoga Park, CA.** This property is located across Topanga Canyon Blvd west of the Site. There was a reported leaking gasoline underground storage tank (UST) in 1989, Three monitoring wells (MW-16, MW-17, and MW-18) out of the seventeen wells installed, were placed on the subject Site, in the grass, across the street from the car wash property. The groundwater in these wells was reported to contain gasoline related constituents between the period of 2004 to 2014. The property was subsequently remediated by several methods including free product recovery, dual phase extraction, and soil vapor extraction. The LARWQCB determined that the contaminant plume was stable or decreasing in areal extent, that there was a low threat for the vapor-intrusion-to-air pathway, and there was a low threat for direct contact and outdoor air exposure and the case was closed in 2017. Due to these factors, this property is considered an HREC for the Site.

3. **Shell Service Station located at 22001 Vanowen Street., Canoga Park, CA.** This property, also located across Topanga Canyon Blvd west of the Site, reported a leaking UST in 1987. The property was subsequently remediated by soil vapor and groundwater extraction, as well as soil excavation. In 1991, seven groundwater monitoring wells (B-11 through B-17) were constructed by Shell on the Site along Topanga Canyon Blvd. In 1997, due to diminished concentrations of contaminants in the groundwater, these monitoring wells were abandoned. The LARWQCB granted closure for the Shell property in 2013. Due to these factors, this property is considered an HREC for the Site.

4. **Former Union Oil Service Station (Currently Red Carpet Car Wash) located at 6760 Topanga Canyon Blvd., Canoga Park, CA.** This property, located across Vanowen Street south of the Site has records listed from 1969 to 2014. The property reported a leaking gasoline UST in 1990. In March 2008, three monitoring wells (GW-7, GW-8, and GW-9) were installed on the subject Site in the north-northeast down-gradient direction—in the grass south of the Assembly Hall and across the street from the Union Oil Service Station. As late as April 2013, constituents

such as MTBE, total petroleum hydrocarbons as gasoline (TPH-g), and tert-butyl alcohol (TBA) were reported in these wells. The site was remediated using soil vapor extraction and the case was closed by the LARWQCB in September 2015. Due to these factors, this property is considered an HREC for the Site.

The above closure determinations indicate the properties were remediated or evaluated to be at low risk. However, does not assure that no impacts to the subject Site are present.

Potential Recognized Environmental Conditions:

This Phase I ESA has revealed no evidence of recognized environmental conditions in connection with the Site except for the following.

1. **An underground hydraulic lift** was located in the southern portion of Shop #2. This lift is now out of use. Shop #2 was previously used for a mechanical auto shop class. Based on a conversation with Mr. Moran, the underground hydraulic lift and the fluids remain in place and have not been removed from the Site. A clarifier was also located on the southern side of Shop #2 that appears to be associated with the former auto shop class. Additional information about the clarifier was not available.

   Due to the potential presence of hazardous material in the underground lifts and/or associated reservoir that could potentially be a source of contamination, the previous use of the class as an auto shop class, and the presence of the associated clarifier, this area is considered a potential REC. However, given the heavy nature of the hydraulic fluid and the limited reservoir capacity, the extent of a potential leak is expected to be limited to the soils below the building.

2. **The Vanowen Plaza Property** located at 22017 Vanowen Street, Canoga Park, CA, is currently being investigated under the oversight of the LARWQCB. Various dry cleaners occupied a unit in a building on this property from 1992 to 2009. Subsurface site investigations showed that the soil, soil vapor, and groundwater are contaminated with perchloroethylene (PCE), trichloroethene (TCE) and other volatile organic compounds (VOCs) as a result of release(s) from the dry-cleaning operations.

   Following the determination that the source of PCE and TCE, the dry-cleaning equipment was replaced with equipment installed in a spill containment pan capable of containing the volume of cleaning agents within the equipment. The dry-cleaning operations have since been discontinued (RCS 2014). In an effort to remediate the property, potassium permanganate was injected to the subsurface in 2015.

   In 2017, Office of Environmental Health Hazard Assessment (OEHHA) conducted vapor intrusion risk assessment and concluded that the risk estimates at the subject Site are less than one in one million and hazard indices are less than one.

   Base on this estimate, the potential health risks from vapor intrusion at the Site related with this release is below commonly accepted thresholds for schools and daycare. However, the property has not yet been granted NFA from the LARWQCB, and the PCE concentration in groundwater at subject Site has not been completely defined; therefore, the presence of PCE and other VOCs under the property is considered a potential REC for the Site pending the outcome of the regulatory process.

Other Recognized Environmental Conditions:

Other Environmental Conditions (OECs) were identified at the Site during this assessment. OECs, or potential RECs, are features or issues that, while being judged to have a relatively low probability of resulting in significant impact to the Site, should be considered in project planning and risk management. The OECs listed below were identified at the Site.

- **Lead-based Paint.** With the exception of newer portable buildings on the Site's, it is considered likely that the paint on the buildings contains, or formerly contained elevated lead concentrations. Due to slow deterioration with time, paint typically flakes off and accumulates in the adjoining soils. This can result in elevated lead concentrations in the soil. Note that the on-site buildings are mostly adjoined by asphalt pavement since 1959. As such, the potential that the soils underlying this pavement have been impacted with lead is considered relatively low. Elevated lead concentrations (greater than background levels), however, are possible in the planters that contain trees between the buildings, or any other unpaved areas adjoining the buildings.
- **Arsenic-Based Herbicide.** It was formerly common practice for the LAUSD to apply an arsenic-based herbicide to the soil immediately prior to paving with asphalt. As such, there is a potential that elevated arsenic concentrations (greater than background levels) are present in the soils immediately underlying the paved portions of the Site.
- **Organochlorine Pesticides.** It was formerly common practice for the LAUSD to apply termiticides around wooden structures at school sites as a means of pest control. As such, there is a potential that elevated OCP concentrations are present in site soils.
- **Polychlorinated Biphenyls.** Four transformers were documented at different locations at the Site: 1) adjacent to the former boiler room; 2) at the northeast corner of Clrm Bldg #3; 3) at the northeast portion of the Site and northwest of the Owensmouth High School compound, and 4) east of Clrm Bldg #2 and just west of the athletic track field. Due to the age of most of the transformers, it is considered possible that they may have previously contained polychlorinated biphenyls (PCBs). The locations of these transformers are identified in Figure 3.

  Transformer oil releases were not observed beneath, or adjacent to, any of the transformers reviewed at the time of this assessment. The transformers were located on concrete foundations that adjoined paved areas.
- **Radon.** The Site and its surrounding area are designated as high potential for indoor-radon levels above 4.0 picocuries per liter in recent alluvium (Radon Potential Zone Map for Southern Los Angeles County, California, California Geologic Survey, January 2005).

RECOMMENDATIONS

The following recommendations are based on the findings and conclusions presented above.

Lead-Based Paint. Prior to disturbing soil at the Site, it is recommended that representative soil samples be collected within the associated area(s) and analyzed for lead. The results of

this investigation should be used to determine if the lead concentrations in soil in these areas are a potential threat to human health.

Arsenic. Prior to disturbing any asphalt at the Site, it is recommended that representative soil samples be collected beneath the asphalt within the associated area(s) and analyzed for arsenic. The results of this investigation should be used to determine if the arsenic concentrations in soil in these areas are a potential threat to human health.

OCPs. Prior to their removal, it is recommended that representative soil samples be collected around wooden structures and analyzed for OCPs. The results of this investigation should be used to determine if the OCP concentrations in soil in these areas are a potential threat to human health.

Transformers. If future construction activities encroach into the immediate vicinity of pad-mounted transformers, it is recommended that the adjoining soils be assessed for the possible presence of PCBs prior to disturbing the soil around the transformer. The results of this investigation should be used to determine if there are detectable concentrations of PCBs in this soil and if the detectable PCBs are a potential threat to human health.

Hydrocarbons. Due to the previous use of the southern part of building Shop #2 as an auto shop, the presence of underground lifts, and an associated clarifier, this area was considered a potential REC. However, the extent of a potential leak is expected to be limited in the soils below the building due to the heavy nature of the hydraulic fluid. Assessment of the soils below the building and the clarifier for the possible presence of hydrocarbons is recommended if future construction activity planned will disturb the soil beneath the building.

Radon. Due to the high potential for indoor-radon levels above 4.0 picocuries per liter at the Site and its surroundings, it is recommended that radon mitigation measures be included in any future buildings or additions.

PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT

•FINAL•

Canoga Park High School
6850 Topanga Canyon Boulevard
Canoga Park, CA 91303

Assessor's Parcel No. 2138-001-900

1.0 INTRODUCTION

The Los Angeles Unified School District (LAUSD) retained Eco & Associates, Inc. (Eco) in order to perform a Phase I Environmental Site Assessment (ESA) for the Canoga Park High School located at 6850 Topanga Canyon Boulevard, Canoga Park, CA (hereafter, the "Site") (Figure 1). The Assessor's Parcel Number (APN) is 2138-001-900. This Phase I ESA was conducted in general accordance with the scope and limitations of ASTM International Standard No. E1527-13 (hereafter, "ASTM E1527-13").

1.1 PURPOSE

The purpose of this Phase I ESA was to identify apparent and potential sources of contamination that, by their association or proximity to the Site, could represent a recognized environmental condition (REC) as defined by ASTM E1527-13. A REC is defined as the presence, or likely presence, of hazardous substances or petroleum products in, on, or at a property due to any release to the environment, under any conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment.

1.2 SCOPE OF SERVICE

The scope of work for this project included the following:

- Review of available information to describe the general geology and hydrogeology at the Site
- Review of historical aerial photographs and topographic maps
- Conduct a search of regulatory records for possible hazardous material handling, spills, storage, and production at the Site or in the site vicinity
- Reconnaissance of the Site and surrounding area
- Preparation of this report describing the findings and conclusions

1.3 SIGNIFICANT ASSUMPTIONS, LIMITATIONS, DEVIATIONS, EXCEPTIONS, AND SPECIAL TERMS AND CONDITIONS

This Phase I ESA, prepared by Eco at the request of LAUSD, was requested for one or more of the following reasons:

- Assistance in the determination of whether any immediate actions at the Site are necessary to comply with existing environmental laws or regulations
- Determination of the presence, or possible presence, of hazardous material releases from past on-site or off-site sources or activities

2.0 SITE DESCRIPTION

2.1 LOCATION AND TOPOGRAPHY

The Site comprises approximately 1,194,464 square feet (SF) or approximately 27.4 acres of land located at the street address of 6850 Topanga Canyon Boulevard, Canoga Park, CA (Figures 1 and 2); and its Los Angeles County APN is 2138-001-900. The Site elevation is 796 feet above sea level. The Site is bound by Vanowen Street on its southern side, Jordan Avenue on its eastern side, Hart Street on its northern side, and Topanga Canyon Boulevard on its western side. Two concrete-lined channels cross the Site. Bell Creek enters the Site at the northwest corner and Calabasas Creek enters the Site at the central portion of the southern boundary. The confluence of both creeks forms the beginning of the Los Angeles River at the central portion of the eastern site boundary.

2.2 SITE IMPROVEMENTS

At the time of this assessment, the Site was occupied by Canoga Park High School. The school's multiple single- and double-story buildings are primarily located on the Site's western half. The buildings appear to be generally of wood-frame construction with stucco siding. The offices and classrooms within these buildings contain typical office and school furnishings.

Multiple buildings in the Site's western portion were being utilized as classrooms, workrooms, gymnasiums, an assembly hall, a cafeteria, and storage/utility rooms. These buildings were generally adjoined by asphalt pavement, landscaped areas, and athletic grounds. The asphalt-paved athletic ground areas had painted court lines and basketball hoops. There was also a baseball field and an athletic track with a grassy central field.

2.3 HISTORY

Based on data collected during this assessment, the Site was undeveloped and vacant state up to approximately 1914. In 1915 the Site was developed as Owensmouth High School with relatively large building (main classroom and administration building) located on the northwestern part of the property. Since 1931, the school has been referred to as Canoga Park High School.

In 1928, the school was comprised of a relatively large main building (main classroom and administration building) and three smaller buildings south of the main building located in the Site's northwestern portion including the Girls gym building. The eastern half of the Site was primarily open land, with an agricultural grove in the southeast portion, Bell Creek and Calabasas Creek, both creeks flowing toward the east. Between 1928 and 1938 two additional large school buildings used as administration and classroom facing Topanga Canyon Blvd. were added in the southwest portion

of the Site. Within that same period, the oval athletic track was moved to its current location in the central portion of the east half of the Site.

In 1939 the assembly hall (14,523 square feet [SF] in the area) was added on the Site's southwestern portion. Between 1952 and 1959, the original large school building and other small building located in the northwest portion of the Site were removed and converted to a playing field. Between 1954 and 1958 buildings include the Cafeteria, Boys Physical Education, Class Room Building (CLRM BLDG) # 2 (28,210 SF), Shop #2 (10,124 SF), and four storage buildings located south of the oval athletic track field were added. In 1960 and 1968 CLRM BLDG # 3, Music Building, Storage Unit Building # 014DOP (914 SF), and CLRM BLDG # 4 (18,419 SF) were added.

During the period between 1974 and 1979, a major remodeling occurred, in which the two-large main school building located on the southwest portion of the Site facing the Topanga Canyon Blvd. and the cement concrete walks connecting the buildings were removed and replaced by other two large buildings referred to as Buildings Unit #1 (18,348 SF) and Unit #2 (29,540 SF).

2.4 DESCRIPTION OF ADJACENT PROPERTIES

Towards the south across Vanowen Street, is the Westfield Topanga Mall parking lot, a large commercial shopping center and Gas Depot Gas Station and Red-Carpet Car Wash. Toward the east side, across Jordan Avenue, is a residential neighborhood comprised of single-family homes and apartment complexes. Toward the north, across Hart Street, is a residential neighborhood comprised of two single-family homes, apartment complexes, and a sporting goods store. Towards the west across Topanga Canyon Boulevard, are multiple small commercial businesses, fast food restaurants, a Shell Gas Station, and the Topanga Car Wash.

3.0 ENVIRONMENTAL SETTING

3.1 REGIONAL AND SITE GEOLOGY

The Site is located in the western portion of San Fernando Valley within the San Fernando Hydrologic Subarea. The western portion of this subarea contains sediments derived from the surrounding hills. The source material has high clay content, averaging 75 percent clay, 5 percent sand, and 20 percent gravel. The valley fill extends to a depth of approximately 750 feet below ground surface (bgs). Underlying the valley fill is the non-water-bearing Modelo (Puente) Formation which consists of marine arkose conglomerates, sandstones, and siliceous and diatomaceous shale.

3.2 REGIONAL AND SITE HYDROGEOLOGY

Based on records search conducted on the Los Angeles County, Department of Public Works online well database at http://dpw.lacounty.gov/general/wells/#, the groundwater beneath the Site is located at a range of depth between 763 feet and 786 feet above sea level. This range is based on data obtained from two wells located approximately 0.5 miles northeast and 0.5 miles west of the Site, respectively. The groundwater flow direction beneath this property is expected towards the east, similar to the topographic gradient. Depth to groundwater has ranged historically from 15 to 20 feet bgs.

3.3 POTENTIAL OIL FIELD ISSUES EVALUATION

- The location of the nearest oil and gas field is 3.4 miles west of the Site; therefore, it is considered to present no direct potential environmental issues.

- There are no exploratory or production oil and gas wells (within 500 feet) of the Site; therefore, it is considered to present no potential issues.
- The Site is not located in a potential methane and hydrogen sulfide zone (Online-City of LA Methane Seepage District Map 2019).

3.4 POTENTIAL GEOHAZARD EVALUATION

- **Nearest Fault Zone.** The nearest fault zone is the Chatsworth Fault located approximately 2.88 miles northwest of the Site. This is a north-dipping reverse fault, approximately 20 km in length, trending from the southwest to the northeast. The most recent surface rupture was in the Late Quaternary with an unknown rupture frequency and slip rate (Online-Los Angeles Fault Map, Southern California Earthquake Data Center, 2019). There are no other known fault zones within 5 miles.
- **Seismic Shaking Hazard Potential.** The seismic shaking hazard potential could be severe due to the predicted probable magnitude of 6.0 to 6.8 along the Chatsworth Fault (Online-Los Angeles Fault Map, Southern California Earthquake Data Center 2019).
- **Liquefaction and Landslide Potential.** Based on the Seismic Hazard Zone Map (1998), the Site falls within areas where the historical occurrence of liquefaction or local geological, geotechnical, and groundwater conditions indicate a potential for permanent ground displacement. Landslide potential is no concern as the Site and surrounding area is on flat land.
- **Flooding Potential.** Flooding potential is considered low as the Site is located in an "area of minimal flood hazard" (FEMA Flood Map 2019). In addition, the site is well drained and is bound by two lined creeks, Bell and Calabasas. Any flood water would be directed to the creeks and channeled east of the Site into the Los Angeles River.
- **Radon.** For the Site and surrounding area, there is a high potential for indoor radon levels above 4.0 picocuries per liter in recent alluvium (Radon Potential Zone Map for Southern Los Angeles County, California, California Geologic Survey, January 2005).

4.0 RECORDS REVIEW

The following subsections present a review of records for the Site and describe information found or provided by these sources. The records reviewed included aerial photographs, topographic maps, street directories, standard environmental federal and state databases, and local agency files.

4.1 ENVIRONMENTAL LIEN AND AUL SEARCH

Environmental Liens and Activity and Use Limitation (AUL), an indication of potentially hazardous material releases, were searched for the Site. The Environmental Lien and AUL Search in Appendix A indicate environmental liens have not been recorded for the Site. In addition, there are no AULs identified for the Site.

4.2 CHAIN OF TITLE REVIEW

The historical Chain of Title for the Site at 6850 Topanga Canyon Boulevard, Canoga Park, CA 91303 (APN 2138-001-900), was requested of Environmental Data Resources (EDR®). A copy of this Chain

of Title report is provided in Appendix B. According to the county record's office, this property has been in the name of the LAUSD, Board of Education, since at least 1940. No other deeds vesting title in the property were found.

4.3 CITY DIRECTORIES

A search of the City Directories Abstract (Appendix B) received from EDR® included city, cross-references, and telephone directories at approximately five-year intervals for the years spanning 1940 through 2014. The listed site occupants for this time period are provided on the following table.

TABLE 1: SUMMARY OF CITY DIRECTORIES

PROPERTY ADDRESS	LISTED SITE OCCUPANT	YEAR
6850 Topanga Canyon Boulevard Canoga Park, CA	CANOGA PARK HIGH SCHOOL	1940
	CANOGA PARK SENIOR HIGH SCHOOL, LOS ANGELES CITY BOARD OF EDUCATION SENIOR HIGH SCHOOLS	1950
	CANOGA PARK HIGH SCHOOL, CANOGA PARK HIGH SCHOOL AGRICULTURE DEPT	1956
	CANOGA PARK HIGH SCHOOL, CANOGA PARK HIGH SCHOOL AGRICULTURE DEPT	1962
	CANOGA PARK HIGH SCHOOL	1965
	CANOGA PARK HIGH SCHOOL	1970
	CANOGA PARK HIGH SCHOOL	1980
	CANOGA PARK HIGH SCHOOL, CANOGA PARK HOSPITAL	1985
	CANOGA PARK HIGH SCHOOL	1991
	CANOGA PARK HIGH SCHOOL, COMMUNITY ADULT SCHOOL	2004
	LAUSD	2010
	LAUSD	2014

As noted on the table above, the Site has been occupied by Canoga Park High School since at least 1940. Though it is noted in a 1985 city directory listing, there is no additional corroborating documentation that Canoga Park Hospital occupied the Site at any point in time. In the 1956 and 1962 listing, the Canoga Park High School Agricultural Department is included. Agricultural use or training related to this may be an indicator that agricultural chemicals or products may have been stored or in use at the Site. Other than the listing for the Agricultural Department, occupants that typically use, store, or generate potentially hazardous materials were not listed at the Site's address.

4.4 BUILDING PERMIT REPORT

A report on the building department record's search of the Site and adjoining properties were obtained from EDR® and is contained in Appendix B. Only one building permit was found for the Site.

On April 7, 2006, an electrical permit was submitted by Jack's Electric to the City of Los Angeles, Department of Building and Safety.

4.5 ENVIRONMENTAL DATABASE REVIEW

Eco conducted a review of regulatory information prepared by EDR®. The search radii equaled or exceeded the criteria specified in ASTM E1527-13. A regulatory records search of this nature is based on information published by state and federal regulatory agencies and is used to evaluate whether the subject Site or near-vicinity properties are listed as having a past or present record of actual or potential environmental impact. Please note that regulatory listings include only those facilities that are known by the regulatory agencies at the time of publication. The EDR® report, dated November 30, 2018, is presented in Appendix B. The complete regulatory lists that were searched as part of this review are provided on pages 3 through 26 of the EDR® Executive Summary. A description of these databases is provided at the end of the EDR® report.

A map provided in the EDR® report shows the location of the subject Site and properties within the search distances defined by ASTM (see Appendix B, Radius Map). As noted in the EDR® report, the Site is listed in the Hazards Network (HAZNET) database for various materials. These materials were reported as follows:

TABLE 2: HAZARDOUS MATERIALS TRANSPORTED FROM SITE

Disposal Date	Volume Disposed (tons)	Material Disposed
1993	5.899	Asbestos-containing waste
1993	0.229	Waste oil and mixed oil
1994	0.2	Other organic solids
1994	0.2	Other inorganic solid waste
1994	3.371	Asbestos-containing waste
1998	26.969	Asbestos-containing waste
1999	0.5	Other organic solids
1999	0.7	Off-specification, aged or surplus organics
1999	0.175	Off-specification, aged or surplus organics
2000	14.32	Asbestos-containing waste
2001	0.1	Other organic solids
2001	0.22	Waste oil and mixed oil
2002	0.16	Other organic solids
2003	1.76	Polychlorinated biphenyls and material containing PCBs
2005	21.07	Asbestos-containing waste
2005	36.24	Asbestos-containing waste
2006	0.12	Other organic solids
2006	0.01	Laboratory waste chemicals

Disposal Date	Volume Disposed (tons)	Material Disposed
2006	0.02	Laboratory waste chemicals
2006	0.07	Laboratory waste chemicals
2007	10	Asbestos-containing waste
2008	7.2	Asbestos-containing waste
2008	15.6	Asbestos-containing waste
2008	1.8	Laboratory waste chemicals
2011	0.4	Asbestos-containing waste
2011	0.4	Asbestos-containing waste
2011	0.4	Asbestos-containing waste
2011	0.4	Asbestos-containing waste
2012	33.712	Not reported
2013	0.45	Not reported
2014	1.2	Asbestos-containing waste
2015	0.22481	Polychlorinated biphenyls and material containing PCBs
2015	0.46	Asbestos-containing waste
2015	0.3065	Other inorganic solid waste
2017	0.23	Asbestos-containing waste

PCB – polychlorinated biphenyl

There are eighteen (18) properties listed upgradient and within 1/4 mile of the Site that have, or have had, the potential to release hazardous materials into the subsurface soil and/or groundwater. Hazardous materials released at such properties would, due to their location, have the potential to impact the soil and/or groundwater underlying the Site. Impacted groundwater beneath off-site properties could migrate into or toward the subject Site. A description of these properties is listed in the following table.

TABLE 3: EDR® SUMMARY OF PROPERTIES LOCATED UPGRADIENT AND WITHIN ¼ MILE OF THE SITE

EDR® ID No.	Property/ Business Name & Address	EDR® Lists	Comments
B5	**VERNS AUTO & TRANSMISSION SERVICE** **6813 1/2 TOPANGA CANYON**	**EDR Hist Auto**	This property, located 90 feet southwest of the Site, was listed in the database from 1970 to 1975. Potentially hazardous material releases were not reported for this property. Due to these factors, this property is not considered a REC for the Site.

EDR® ID NO.	PROPERTY/ BUSINESS NAME & ADDRESS	EDR® LISTS	COMMENTS
B6-B10	TOPANGA CAR WASH 6829 TOPANGA CANYON	HIST CORTESE, EDR Hist Auto, UST, LUST, SWEEPS UST, FID UST	This property is located 137 feet southwest of the Site. There was a reported leaking gasoline UST in 1989, which could potentially impact an aquifer used for drinking water. A well installation workplan was submitted in 2010 and seventeen wells were installed. Three of these wells: MW-16, MW-17, and MW-18, were placed on the Site (Canoga Park HS), in the grass, across the street from the car wash property. The groundwater in these wells was reported to contain gasoline related constituents between the period of 2004 to 2014. The property was subsequently remediated by several methods including free product recovery, dual phase extraction, and soil vapor extraction. In 2017, a well destruction report was submitted to the LARWQCB and the case was closed. The LARWQCB had determined that the contaminant plume was stable or decreasing in areal extent, that there was a low threat for the vapor-intrusion-to-air pathway, and there was a low threat for direct contact and outdoor air exposure. Due to these factors, this property is considered an HREC for the Site.
C11-C15	Thrifty Oil Station 6851 Topanga Canyon	HIST CORTESE, SWEEPS UST, HAZNET, LUST, HIST UST, EDR HIST AUTO, FID UST	This property, located 139 feet west-southwest of the Site, reported a leaking UST in 1990. The property was subsequently remediated by soil excavation, soil-vapor extraction, and groundwater extraction. The case was closed in 2010 by the LARWQCB because the groundwater plume was stable and the subsurface lithology (tight silt and clay) limited the migration of contaminants. In February 1994, two wells (MW9 and MW10) were installed on the subject Site (Canoga Park HS), in the grass, across the street from the Thrifty Oil Station in a northeast down-gradient direction. The 2010 LARWQCB closure letter states that "MW9 and MW10 have shown [non-detect] ND for all fuel constituents since October 1994". However, the Geotracker groundwater monitoring well database (spanning from October 2001 to October 2009) shows concentrations of methyl-tert-butyl ether (MTBE) in well MW9 as late as November 2007 and in MW10 as late as June 2008. Due to these factors, this property is considered an HREC for the Site.

EDR® ID NO.	PROPERTY/ BUSINESS NAME & ADDRESS	EDR® LISTS	COMMENTS
B16-B23	Shell Service Station 22001 Vanowen Street	SWEEPS UST, FID UST, EMI, HIST AUTO, LUST, HIST CORTESE, HIST UST, HAZNET, RCRA SQG, FINDS, ECHO,	This property, located 166 feet southwest of the Site, reported a leaking UST in 1987. The property was subsequently remediated by soil vapor and groundwater extraction, as well as soil excavation. In 1991, seven groundwater monitoring wells (B-11 through B-17) were constructed by Shell on the Site along Topanga Canyon Blvd. In 1997, due to diminished concentrations of contaminants in the groundwater, these monitoring wells were abandoned. The LARWQCB granted closure for the Shell property in 2013. Due to these factors, this property is considered an HREC for the Site.
D24-D30	UNION OIL SERVICE STATION/RED CARPET CAR WASH 6760 TOPANGA CANYON	UST, HIST UST, SWEEPS UST, FID UST, EDR HIST AUTO, LUST, HIST CORTESE	This property, located 220 feet south-southwest of the Site has records listed from 1969 to 2014. The property reported a leaking gasoline UST in 1990 which could potentially impact an aquifer used for drinking water. The site was subsequently remediated using soil vapor extraction. The case was closed by the LARWQCB in September 2015. In March 2008, three monitoring wells (GW-7, GW-8, and GW-9) were installed on the subject Site in the north-northeast down-gradient direction—in the grass south of the Assembly Hall and across the street from the Union Oil Service Station. As late as April 2013, constituents such as MTBE, total petroleum hydrocarbons as gasoline (TPH-g), and tert-butyl alcohol (TBA) were found in these wells. Due to these factors, this property is considered an HREC for the Site.
B31, B41	Pacific Bell 22012 Vanowen Street	CA LUST, CA HIST CORTESE	This was a phone company property located 235 feet southwest of the Site. The property reported a leaking diesel UST in 1988 which could potentially impact an aquifer used for drinking water. No remediation activities were reported. There was no additional information available for this case. The case was closed in 1996 by the LARWQCB. Due to these factors, this property is not considered a REC for the Site.
E32 - E34	Pep Boys 7020 Topanga Canyon	HIST UST, SWEEPS UST, FID UST, RCRA NON GEN/NLR, FINDS, ECHO	Located 248 feet north-northwest of the Site, this auto parts/repair facility had a waste oil tank and is listed as a small quantity generator. No violations were found for this property. Due to these factors, this property is not considered a REC for the Site.

EDR® ID NO.	PROPERTY/ BUSINESS NAME & ADDRESS	EDR® LISTS	COMMENTS
B35-B40	White Angel Cleaners 22017 Vanowen Street	DRYCLEANERS, HIST CLEANER, RCRA-SQG, CA CPS-SLIC, FINDS, ECHO	The site is a single, three-story structure and is occupied by shops on the main floors and offices on the upper floors. The building was constructed in approximately 1963 and various dry cleaners occupied a unit in the building and operated a dry cleaning business from 1992 to 2009. A Phase I environmental site assessment (ESA) conducted in 2002 for property transaction indicated the existence of recognized environmental conditions. Subsurface site investigations conducted afterward in 2002, 2003 and 2007 showed that the soil, soil vapor, and groundwater are contaminated with perchloroethylene (PCE), trichloroethene (TCE) and other volatile organic compounds (VOCs) as a result of release(s) from the dry cleaning operations. The site investigations involved soil vapor survey, soil and groundwater sampling, and installation of groundwater monitoring wells. Groundwater monitoring has been conducted at the site since 2005 and site investigations were still underway as of 2015. In October 2015, the completion of remediation by injection of potassium permanganate was confirmed in a letter by the LARWQCB dated October 2016. This case is still open. Due to these factors, this property is considered a REC for the Site.
E42-E44	Bob Smith BMW 7050 Topanga Canyon	RCRA-SQG, CA LUST, CA SWEEPS UST, CA HIST UST, CA HIST CORTESE, CA HIST UST	This auto dealership, located 452 feet north-northwest of the Site, reported a leaking gasoline UST in 1992 during tank closure activities which affected the soil. No remediation activities were reported. There was no additional information available for this case. The case was closed in 1993 by the LARWQCB. Due to these factors, this property is not considered a REC for the Site.
E45-E46	Warner Auto Center 7039 Topanga Canyon	RCRA NonGen / NLR, FINDS, ECHO, CA AST	This auto repair property, located 454 feet north-northwest of the Site, is permitted for an AST on site. No violations were reported. Due to these factors, this property is not considered a REC for the Site.
E47	RADEMACHER, ROBERT 7056 TOPANGA CANYON	HIST AUTO	This auto service property, located 486 feet north-northwest of the Site, is listed as a gasoline service station. No violations were reported. Due to these factors, this property is not considered a REC for the Site.

EDR® ID NO.	PROPERTY/ BUSINESS NAME & ADDRESS	EDR® LISTS	COMMENTS
F49	Pacific Bell 6685 Topanga Canyon	RCRA-SQG, CA LUST, CA FID UST, FINDS, ECHO	*This was a phone company property, located 534 feet south-southwest of the Site, which reported a leaking gasoline UST in March 1989 which affected the soil. The abatement method involved excavation and disposal. Site assessment and pollution characterization activities began in October 1989. In May 1994, post-remedial action monitoring began. In December 1996, the LUST database file states "There was never a release from this site. All soil & groundwater samples tested non-detect". The case was closed in 1996 by the LARWQCB. Due to these factors, this property is not considered a REC for the Site.* The site was subsequently remediated and the case was closed in 1996.
51	Wade Rouss 7100 Topanga Canyon	CA HIST UST, CA HAZNET	This property, located 693 feet north-northwest of the Site, is listed as a tire service. No violations were reported. Due to these factors, this property is not considered a REC for the Site.
F52-F54	Target Store/CVS Pharmacy 6700 Topanga Canyon	RCRA-LQG, RCRA-CESQG, FINDS, ECHO,	This department store, located 693 feet south-southwest of the Site, is listed as a small and large quantity generator. No violations were reported. Due to these factors, this property is not considered a REC for the Site.
F55-F57	Pacific Bell 6685 Topanga Canyon	CA SWEEPS UST, CA UST, CA SWEEPS UST, CA HIST CORTESE	This utility property, located 714 feet south-southwest of the Site, is permitted for a UST on site. No violations were reported. Due to these factors, this property is not considered a REC for the Site.
G58	GERARD DESIGN 7103 OWENSMOUTH AVE	RCRA-SQG, FINDS, ECHO, CA HAZNET	This facility, located 805 feet north-north-east of the Site, is listed as a small quantity generator. No violations were reported. Due to these factors, this property is not considered a REC for the Site.
G59	Lloyds Place Auto Repair 7103 OWENSMOUTH AVE	RCRA-SQG, FINDS, ECHO	This auto repair facility, located 805 feet north-north-east of the Site, is listed as a small quantity generator. No violations were reported. Due to these factors, this property is not considered a REC for the Site.
I63-I68	TOP OF THE LINE CLEANERS 7138 OWENSMOUTH AVE	CA DRYCLEANERS, RCRA NonGen / NLR, FINDS, ECHO, CA EMI	This dry cleaning facility, located 1,176 feet north-northeast of the Site, is listed for having chemicals related to the dry cleaning industry. No violations were reported. Due to these factors, this property is not considered a REC for the Site.

Note: Table Information Source: These properties and a description of the acronyms above are identified in Appendix B, EDR® Report, Radius Map and GeoCheck, Executive Summary, beginning on Page 5.

Based on a review of the properties in the EDR® database report, there are indications that contaminants released from the properties listed above could impact the soil and/or groundwater underlying the Site.

4.6 AERIAL PHOTOGRAPH REVIEW

The following aerial photographs were reviewed in order to assess land use over time and look for evidence of potentially hazardous material storage, usage, and/or disposal areas. Copies of these photographs are provided in Appendix C.

TABLE 4: AERIAL PHOTOGRAPH REVIEW SUMMARY

AERIAL PHOTO DATE	OBSERVATIONS
1928	In the 1928 aerial photograph, a narrow, tree-lined street (Vassar Avenue) divides the center of the Site into western and eastern halves. The western half of the Site appears in use as a school. A relatively large building (main classroom and administration building) and three smaller buildings south of the large building are visible in the Site's northwestern portion. South of the smaller buildings appears an open field and an oval unpaved athletic track. The eastern half of the Site is primarily open land, with an agricultural grove in the southeast portion, and both Bell Creek and Calabasas Creek naturally flowing toward the east. Adjacent land, both south and west of the Site, appears to be agricultural land. The land north and east of the Site is a sparsely populated residential neighborhood with streets in place. The Site perimeter streets (Hart Street, Jordan Avenue, Vanowen Street, and Topanga Canyon Boulevard) are already present.
1938	Two additional large school buildings appear in the southwest portion of the Site. The oval athletic track has been moved to its current location in the central portion of the east half of the Site. A relatively small building appears in the northeast portion of the Site. Surrounding land appears similar to that observed in the 1928 aerial photograph.
1947	One additional large building (Assembly Hall) and two smaller school buildings appear in the southwest portion of the Site. Surrounding land appears similar to that observed in the 1938 aerial photograph.
1952	Additional small school buildings appear in the west and south portions of the Site. Residential development has expanded west, north and east of the Site. Bell and Calabasas Creeks have been converted to controlled channels. Vanowen Street appears to be paved.
1959	Additional small and medium-sized school buildings appear in the west and south portions of the Site. The original large school building in the northwest portion of the Site (apparent in the 1928 photograph) has been removed and a playing field is present in the location. The building that was in the northeast portion of the Site has been removed and the area has been converted to a paved parking lot and a building in the location of the current boy's Physical Education Building is visible. Residential development has expanded southwest, west, north, and east of the Site. A large industrial facility appears downgradient, southeast of the Site. Open agricultural land still appears south of the Site. Bell and Calabasas Creeks have been concrete-lined. The beginning of the concrete-lined Los Angeles River appears east of the Site. The first signs of commercial business along Topanga Canyon Boulevard appear immediately west of the Site. All Site perimeter streets are paved.
1967	Additional small school buildings appear in the northeast and southeast portions of the Site. The Topanga Plaza shopping mall appears south of the Site. Additional commercial businesses along Topanga Canyon Boulevard appear immediately west of the Site.

AERIAL PHOTO DATE	OBSERVATIONS
1970	Similar to 1967. A few small buildings have been removed from the northeast portion of the Site.
1979	In the southwest portion of the Site, a large main building facing Topanga Canyon Blvd. has been replaced by two large buildings.
1983	Similar to 1979. A few small buildings have been removed from the northwest and northeast portion of the Site.
1989	Similar to 1983. A few small buildings have been added to the northeast portion of the Site.
1994	Similar to 1989.
2002	Similar to 1994. A few small buildings have been added to the northeast portion of the Site.
2005	Similar to 2002.
2009	Similar to 2005.
2012	Similar to 2009.
2016	Similar to 2012.

As noted above, indications of potential contaminant sources, such as landfills, large aboveground tanks, oil wells, or pipelines, were not visible within the Site. Other than the small agricultural areas identified, there were no observable potential RECs within the Site or the adjoining properties in the aerial photographs dating between 1928 and 2016.

4.7 TOPOGRAPHIC MAP REVIEW

Topographic maps dating between 1903 and 2012 were reviewed as part of this assessment. These maps are provided in Appendix C of this report. Descriptions of these maps are provided in the table below. As noted on these maps, structures of concern, such as pipelines, oil wells, and landfills are not shown within the Site or immediate site vicinity.

TABLE 5: TOPOGRAPHIC MAP REVIEW SUMMARY

TOPO DATE	OBSERVATIONS
1903	The Site is shown as open land with no building structures within the Site. Canoga Avenue and the Southern Pacific Rail Road are shown to the east, Sherman Way and the Pacific Electric Rail Line to the North, Topanga Canyon Boulevard to the west, and Calabasas Creek to the South. A few structures are shown approximately ½ mile northeast of the Site, near the intersection of Sherman Way and Canoga Avenue.
1925	The main school building is shown at the southeast corner of Topanga Canyon and Hart Street. Vanowen Street is shown south of the Site. Residential streets appear west, north, and east of the Site. Vassar Avenue is shown crossing the Site from north to south. Residential and commercial development appears north of the Site.
1927, 1928	Similar to 1925. No change is shown at the Site or the immediate site vicinity.
1929	No information was provided on the EDR® map image.

TOPO DATE	OBSERVATIONS
1932, 1933	More on-site buildings are shown. Additional streets and structures appear northeast of the Site.
1944	Similar to 1932. Additional streets and structures appear north and east of the Site. Eton Avenue School appears east of Canoga Avenue.
1947	Similar to 1944. No change is shown at the Site or the immediate site vicinity.
1952	Additional small school structures appear on the Site. Additional streets are shown west of the Site. Our Lady of the Valley school appears north of the Site. Chatsworth Creek, Bell Creek, Calabasas Creek, and the Los Angeles River are shown for the first time.
1967	Additional large school structures appear on the Site and several buildings on the northern portion of the Site appear removed. Significant residential development appears west of the Site. Large commercial and industrial complexes appear south and southeast of the Site.
2012	The topo map only shows roadways and elevation contours. Building structures and the use of properties are not shown.

As noted above, there was no potential RECs shown within the Site or the adjoining properties in the topographic maps dating between 1903 and 2012.

4.8 SANBORN® MAP REVIEW

Three Sanborn® Maps were found for the Site and site vicinity. Copies of these maps are provided in Appendix C.

TABLE 6: SANBORN® MAPS REVIEW SUMMARY

SANBORN® MAP DATE	OBSERVATIONS
1919	The former Main Owensmouth High School building is shown on the southeast corner of Topanga Canyon and Hart Street. Former Vassar Avenue bisecting the Site is shown east of the building.
1927	South of the main building, nine additional smaller structures are shown including a gymnasium and a manual arts building.
1932	The former main Owensmouth High School building appears similar to 1927 except for the small classroom added on the southwest of the main school building. The former main Canoga Park High School Administration Building, classroom, and former boiler room is shown on the southwest portion of the Site,

As noted above, the property has been in use as a school since on or before 1919. Indications of potential contaminant sources such as underground tanks, landfills, large aboveground tanks, oil wells, or pipelines, were not identified within the Site. There were no observable potential RECs within the Site or the adjoining properties in the Sanborn® maps dating between 1919 and 1932.

4.9 LOCAL AGENCY FILES

Environmental records pertaining to on-site or near-vicinity hazardous material sources and/or releases were obtained from the following sources. A summary of these records follows in the subsections below;

- Los Angeles County Fire Department (LACFD)
- Los Angeles Regional Water Quality Control Board (LARWQCB-Geotracker)
- The state of California, Department of Toxic Substances Control (DTSC)
- South Coast Air Quality Management District (SCAQMD), and
- California Division of Oil, Gas, and Geothermal Resources (DOGGR)

4.9.1 LOS ANGELES COUNTY FIRE DEPARTMENT

Records for the Site were requested from the LACFD. The LACFD maintains records pertaining to underground storage tanks, industrial waste, stormwater, and hazardous material releases. Public records received from LACFD regarding the Site are attached in Appendix D. The type of record obtained and the summary is listed below.

Consolidated Contingency Plan for Canoga Park High School prepared by LAUSD dated March 6, 2012. The contingency plan indicates the following relevant information:

- Presence of hazardous material onsite at or above 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet for compressed gases but not at or above a threshold amount established by a Certified Unified Program Agency (CUPA).
- No underground storage tanks (USTs)
- No above ground storage tanks (ASTs)

- No regulated substances stored at the site at greater than the threshold quantities established by the California Accidental Release Program (Cal ARP).

Unified Program (UP) Form – Hazardous Material Inventory – chemical Description, 2012 Reporting Year. The inventory indicates the presence of the following chemical information.

TABLE 7: HAZARDOUS WASTE INVENTORY – THE YEAR 2012

CHEMICAL NAME	OBSERVATIONS	MAXIMUM PER YEAR
Gasoline	55 gallons	Not available
Waste Asbestos	1 cubic yard	2 cubic yards

LACFD – Inspection Report dated April 11, 2013

- No notice of violation listed

An inspection report dated November 15, 2016

- The facility contains limited amounts of hazardous waste (including caustic alkali liquids, waste formaldehyde solution, waste flammable liquids, waste toxic liquids, and waste oxidizing liquids) from the science lab and universal waste (fluorescent light bulbs and used batteries).
- No notice of violations listed.

4.9.2 LOS ANGELES REGIONAL WATER QUALITY CONTROL BOARD

Records from the LARWQCB were searched via their online search program at http://geotracker.swrcb.ca.gov. The properties listed in their database are known to have released potentially hazardous materials into the underlying soil and groundwater. The Site was not listed within the LARWQCB files (Appendix D). However, adjacent properties were found in the Geotracker database and are discussed in Section 7.2.

4.9.3 DEPARTMENT OF TOXIC SUBSTANCES CONTROL

The DTSC records were searched using their map interface program at http://www.envirostor.dtsc.ca.gov/public. A search of this database revealed no DTSC-regulated properties (properties that use and/or have documented contaminant releases) within the ¼ mile and upgradient of the Site. In a letter response from the DTSC, dated December 6, 2018, the DTSC stated that no records were found for the Site (Appendix D).

4.9.4 SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT

Several records were found which may include permits, notice of violations, asbestos removal records, and complaints in the SCAQMD files (Appendix D). The Site was also searched via the online search program at http://www.aqmd.gov. Notice of potential contaminant sources, such as underground fuel tanks, were not identified in the SCAQMD files.

4.9.5 CALIFORNIA DIVISION OF OIL, GAS, AND GEOTHERMAL RESOURCES

Oil well maps provided by DOGGR were searched via their search program at https://maps.conservation.ca.gov/doggr/wellfinder. Based on a review of the maps provided by DOGGR, there are no oil wells located at the Site or in the Site vicinity.

5.0 SITE RECONNAISSANCE

On December 03, 2018, representatives of Eco (Mr. Filmon Tesfaslasie) and LAUSD (Mr. Eric Longenecker) visited the Site in order to assess its current utilization and visually search for indication of surface and subsurface contamination. Mr. Carlos Moran (Canoga Park High School Plant Manager) and Mr. Ralph Wilkinson (Canoga Park High School Chemical Safety Coordinator) were interviewed during the Site visit. Photographs taken during the site visit are included in Appendix E. A user questionnaire was filled out and is included in Appendix F. Observations made during the site reconnaissance are presented below.

5.1 SITE OBSERVATIONS

The Site is bisected by Bell Creek in the north and Calabasas Creek in the south (Figure 3). The greater portion of the Site, which is located west of the confluence of the Bell Creek and Calabasas Creek was occupied by Canoga Park High School. The number and description (construction year, size, type, and others) of the buildings in the Canoga Park High School is included in Appendix A.

The portion north of Bell Creek was occupied by Owensmouth High School, and the area south of the Calabasas Creek was used for agricultural purposes. Both the Bell Creek and Calabasas creek were concrete-lined and open from the top channels at the Site. When the two creeks are joined, they drain west to the Los Angeles River (Photo Nos. 3 and 4). The following bullets are selected details of the observation made during the site walk of the School Campus.

- The offices and classrooms within the Main Buildings Unit #1, Unit #2, and Clrm Bldg #2, and Clrm Bldg #3 contained typical office and school furnishings. Most of the areas adjoining the buildings were covered with asphalt or concrete, except for areas covered with plants or playground (turf). Laboratory chemical storage rooms were located on the second floor of Unit #2 in rooms 221, 226, and 228 (Photo Nos. 5 through 8). The laboratory chemicals were labeled and stored in shelves. The chemicals inventory and storage activities are coordinated by Mr. Ralph Wilkinson. The inventory of the chemicals stored in those rooms is attached in Appendix F. No potential contaminant releases were identified in these areas.
- Janitor's closets were also located in each of the building. The janitor closets stored domestic cleaning detergent and other cleaning tools (Photo 9). The former boiler room located east of the building Unit #2 was used as the office of the plant manager. No active or indications of historic releases were observed in this building.
- A Ceramic workshop located in Room 315A in Clrm Bldg #3 contained a non-operational kiln. A clarifier that appears to be attached to a ceramic workshop was also located on the north side of the building (Photo 10 and Figure 3). Lead or other heavy metal may have been used as colorant or glazes for ceramic works and could be of potential environmental concern. However, no contaminant sources associated with this workshop and/ or releases were recorded or observed during the site visit.
- The presence of a former underground hydraulic lift (hoist) in the southern portion of the Shop #2 building located east of the Assembly Hall and the Music building was discussed with the Plant Manager (Mr. Moran). This room was previously used as a mechanical auto shop class. Based on the telephone conversation with Mr. Moran, the underground hoists are still in the building and may contain hydraulic fluids. A clarifier was also located on the southern side of the Shop #2 that appears to be associated with the former auto shop. Currently, this space is used as an Engineering

and Design Lab (Photo 11 and 12; Figure 3). Due the previous use of this building as auto shop class and the presence of unground lifts that could potentially be a source of contamination, the area around this room/ class and the associated clarifier are considered a REC.

- Four transformers were located during this Site walk. The locations of the transformers as shown in Figure 3 are: 1) adjacent to the former boiler room (Photo 13); 2) northeast corner of Clrm Bldg #3 (Photo 14); 3) northeast portion of the Site in the Owensmouth High School compound (Photo 15); and 4) east of Clrm Bldg #2 and just west of the playground turf (Photo 16). The latter is the main transformer at the Site housed in an enclosed area. Access to this enclosed area was not possible during the Site walk. The other three transformers were mounted on a concrete pad and no evidence of active or historic leaks was observed around the transformers.

- Landscape tools and fuel containers were encountered at the Storage Unit (Building ID #26267) located northeast of the Boys Physical Education Building (Photo 17; Figure 3). The storage unit paved with concrete container number of gasoline string trimmer (Photo 18), a lawn mower, 5-gallon diesel container (Photo 19), gear lubricant (Photo 20), refill funnel, and some other hand-held tools stored on the floor and on wooden tables/ benches. Minor stains of hydrocarbon were observed in areas where the gasoline trimmers were stored (Photo 18), however, these stains/ leaks noted were minimal and not likely to have permeated through the concrete pavement.

- A relatively small concrete building (approximately 8 feet by 8 feet) that has two rooms was located on the northeast portion of the Site - in the Owensmouth High School area (Photo 21; Figure 3). One of the rooms (the eastern room) was used as storage and dispenser of gasoline. During the Site walk, two 55-gallon drums containing gasoline were observed in the room. The drums were labeled as "gasoline" in white paint and one of the drums was fitted with hand operated drum pump (Photo 22). “Flammable” label was also posted on the entrance door of the room. No evidence of active or historic leaks was observed around the building.

  The western room and another relatively smaller concrete building adjacent to this building (Photo 23) were not accessible during the Site walk, and therefore the content in those rooms was not identified. However, it is most likely those units store or used to store hazardous materials. Per Mr. Moran, those rooms have not been accessed or opened for at least 15 years. No evidence of active or historic leaks was observed around those units.

- Destroyed soil vapor and groundwater monitoring wells surface completions were observed in the southwest portion of the Site (Photo 24: Figure 3). Per Mr. Longenecker and review of documents, those destroyed wells were part of the assessment and monitoring to evaluate and determine the potential release of the petroleum hydrocarbon from the adjacent properties located in the southwest of the Site. Detail discussion of the impact of the adjacent property is discussed in Section 9.2 and in the following section.

- None of the following were observed at, or immediately adjacent to, the Site:
  - Fill ports or vent pipes related to underground storage tanks
  - Above ground storage tanks

- Groundwater monitoring wells and/or vadose zone wells
- Pools of potentially hazardous substances
- Wastewater discharge pipes
- Ponds, pits, sumps, or other underground waste disposal areas
- Unusual or noxious odors

5.2 ADJOINING PROPERTY OBSERVATIONS

A summary of single-family dwellings and apartments and small commercial businesses are as follows:

- **Jordan Avenue** is located along the Site's eastern side (Photo No. 25). Residential apartment buildings and small businesses are located immediately east of the Site and this avenue. The small business, homes, and buildings within these properties are adjoined by well-maintained landscaped areas and paved areas. Potential contaminant sources and/or releases are not observed within the avenue or residential properties located immediately east of the Site.
- **Hart Street** is located along the Site's northern side (Photo 26). Residential apartment buildings and dwellings are located immediately north of the Site and this street. Potential contaminant sources and/or releases are not observed within the avenue or residential properties located immediately east of the Site.
- **Vanowen Street** is located along the Site's southern side (Photo 27). The Western Topanga Mall parking lot is located immediately south of the Site and this street. Gas Depot gas station and Red-Carpet Car Wash are also located immediately south of the Vanowen Street and southwest of the Site (Photo 28). Due to the proximity of the gas station to the Site and previous history of release, the gas station may potentially impact the subject Site.
- **Topanga Canyon Boulevard**, three lanes each direction with a painted median, is located along the Site's western side (Photo 29 and 30). The properties located immediately west of the Site and Topanga Canyon Boulevard are occupied by Shell Gas Station (Photo 31), Topanga Car Wash (Photo 32), and other small commercial businesses. Vanowen Plaza property where former dry cleaning was located is located west of the Shell Gas Station. Both the Shell Gas Station and Vanowen Plaza Property may impact the subject Site, due to their proximity to the subject site and previous history of release. Details of the potential impact of this gas station are discussed in Section 7.2.

5.3 USER PROVIDED INFORMATION

LAUSD provided a scope of work and work authorization to conduct this Phase I ESA at the Site. The following information was provided by LAUSD (Appendix F):

- Tabulated information regarding the size, type, and name of the existing building (Appendix F)
- Multiple historic building plans were prepared between 1924 and 1986.

TABLE 8: SITE BUILDING DRAWINGS

YEAR OF DRAWING	DRAWING TITLE AND DESCRIPTION
1924	Former Owensmouth Main High School Building showing Floor Plan, Foundation Plan, of the Main Building and Shop Building
1925	Floor and Foundation Plan of Gymnasium
1938	Index to Drawing - New Assembly Hall
1945	Grading and Paving Plan of the Site.
1948	Plot Plan of the Electrical Shop Building
1953	Plot Plan – 1952 Type Classroom and Sanitary Buildings
1957	Plot Plan Plumbing – show underground piping (mainly gas line)
1957	New Classroom and Industrial Art Buildings and Alteration to Shop Building (Shop # 2) – Grade Plan for Rock and Oil Pavement.
1959	Addition of New Classroom building (Clrm Bldg #3) connected w
1959	New Classroom Building – Music Building and Connecting arcades
1960	Maintenance – Kiln Hood and Kiln Room Air Supply Installation
1975	Demolishing Plan – show as-built plan layout of the school similar to the present. Planned renovation work: existing paving removal plan around the east of Clrm Bldg #2, and east and south of Assembly Hall is shown
1984	Boiler Modernization Program showing two boilers at the Boys Physical Education Bldg., and one boiler in the Girls Gymnasium Bldg.
1986	Plot Plan showing maintenance work at Assembly Hall, New Building, and others

Underground structures such as USTs and hydraulic hoists were not identified in any of the site drawings.

5.4 SPECIALIZED INFORMATION

No specialized knowledge of RECs or Other Environmental Conditions (OECs) or potential RECs; see Section 7.2 below) associated with the Site was reported to Eco by the LAUSD or other site representatives.

5.5 COMMONLY KNOWN OR REASONABLY ASCERTAINABLE INFORMATION

Eco was not provided with any commonly known knowledge or reasonably ascertainable information about the Site that would constitute a REC. However, the information listed below is considered common to many LAUSD properties based on past maintenance and construction practices:

Lead-based Paint. With the exception of newer portable buildings on the Site's, it is considered likely that the paint on the buildings contains, or formerly contained elevated lead concentrations. Due to slow deterioration with time, paint typically flakes off and accumulates in the adjoining soils. This can result in elevated lead concentrations in the soil.

Note that the on-site buildings are mostly adjoined by asphalt pavement since 1959. As such, the potential that the soils underlying this pavement have been impacted with lead is considered relatively low. Elevated lead concentrations (greater than background levels), however, are possible in the planters that contain trees between the buildings, or any other unpaved areas adjoining the buildings.

Arsenic-Based Herbicide. It was formerly common practice for the LAUSD to apply an arsenic-based herbicide to the soil immediately prior to paving with asphalt. As such, there is a potential that elevated arsenic concentrations (greater than background levels) are present in the soils immediately underlying the paved portions of the Site.

Organochlorine Pesticides. It was formerly common practice for the LAUSD to apply termiticides around wooden structures at school sites as a means of pest control. As such, there is a potential that elevated OCP concentrations are present in site soils.

6.0 PRELIMINARY ENVIRONMENTAL SCREENING FOR EXISTING SCHOOLS

6.1 PRELIMINARY ENVIRONMENTAL SCREENING

A two-page Preliminary Environmental Screening of Existing School Site was prepared and is included as Appendix F of this report. This screening assesses the potential for environmental hazards to students and staff at an existing school. These hazards include those associated with power lines, railroads, traffic noise, faults, floods, and landslides. Liquefaction was the only hazard identified during this screening.

7.0 PHASE I ESA FINDINGS AND CONCLUSIONS

7.1 SITE BACKGROUND

Based on data collected during this assessment, the Site was undeveloped and vacant up to approximately 1914. In 1915, the Site was developed as Owensmouth High School with a single relatively large building (main classroom and administration building) located on the northwestern part of the property. Since 1931, the school has been referred to as Canoga Park High School.

In 1928, the school was comprised of a relatively large main building (main classroom and administration building) and three smaller buildings south of the main building located in the Site's northwestern portion including the Girls Gym building. The eastern half of the Site was primarily open land, with an agricultural grove in the southeast portion, Bell Creek and Calabasas Creek, both creeks flowing toward the east. Between 1928 and 1938 two additional large school buildings used as administration and classroom facing Topanga Canyon Blvd. were added in the southwest portion of the Site. Within that same period, the oval athletic track was moved to its current location in the central portion of the east half of the Site.

In 1939, the Assembly Hall (14,523 square feet [SF] in an area) was added on the Site's southwestern portion. Between 1952 and 1959, the original large school building and another small building located in the northwest portion of the Site were removed and converted to an athletic field. Between 1954 and 1958, buildings including the Cafeteria, Boys Physical Education, Clrm Bldg #2 (28,210 SF), Shop #2 (10,124 SF), and four storage buildings located south of the oval athletic track field were added. In 1960 and 1968, Clrm Bldg #3, Music building, Storage Unit building # 014DOP (914 SF), and Clrm Bldg #4 (18,419 SF) were added.

During the period between 1974 and 1979, a major remodeling occurred, in which the two-large main school buildings, located on the southwest portion of the Site facing Topanga Canyon Blvd and the cement concrete walks connecting the buildings, were removed and replaced by other two large buildings referred as buildings Unit #1 (18,348 ft2) and Unit #2 (29,540 SF).

7.2 RECOGNIZED ENVIRONMENTAL CONDITIONS

The Phase I ESA was conducted in general conformance with the scope and limitations of ASTM International, Standard E1527-13 (hereafter, ASTM E1527-13). This assessment has revealed no evidence of potential RECs in connection with this property except for the following:

Potential RECs:

1. **Underground hydraulic lift located in Shop #2 building's southern portion.** This lift is now out of use. This room/ class was previously used for mechanical auto shop class. Based on the conversation with Mr. Moran, the underground hydraulic lift and the fluids remain in place and have not been removed from the Site. A clarifier was also located on the southern side of the Shop #2 that appears to be associated with the former auto shop class. Additional information about the clarifier was not available. Hydraulic lifts operate using an air/oil combination and most lifts have hydraulic oil reservoirs as part of their system. The reservoirs can be above ground but are more commonly found underground. The capacity of the reservoirs typically ranges from about 30 to 50 gallons. Hydraulic oil is most commonly a mixture of oil range petroleum hydrocarbons and can be considered hazardous to the environment when released.

   Due to the potential presence of hazardous material in the underground lifts and/or associated reservoir that could potentially be a source of contamination; the previous use of the class as auto shop class; and presence of the associated clarifier, this is considered a REC. However, given the heavy nature of the hydraulic fluid and the limited reservoir capacity, the extent of a potential leak is expected to be limited in extent to the soils below the building.

2. **Vanowen Plaza Property located at 22017 Vanowen Street, Canoga Park**. This property is currently being investigated under the oversight of the LARWQCB due to hazardous materials releases on that property. Various dry cleaners occupied a unit in a building on this property from 1992 to 2009. A Phase I environmental site assessment (ESA) conducted in 2002 for property transaction indicated the existence of recognized environmental conditions. Subsurface site investigations conducted in 2002, 2003, 2007, and 2015 showed that the soil, soil vapor, and groundwater are contaminated with perchloroethylene (PCE), trichloroethene (TCE) and other volatile organic compounds (VOCs) as a result of release(s) from the dry-cleaning operations. The maximum PCE concentration in soil was reported at 1,100 µg/kg and the investigation indicated the migration of PCE in soil vapor and groundwater outside the dry cleaner building. The investigation also indicated PCE concentrations increase with depth indicating the elevated PCE concentration in soil vapor were from groundwater or soil close to groundwater (off-gassing).

   Following the determination that the source of PCE and TCE were from the dry cleaning, the dry-cleaning equipment was replaced with equipment installed in a spill containment pan capable of containing the volume of cleaning agents within the equipment. The dry-cleaning operations have since been discontinued (RCS, 2014). In October 2015, the

completion of remediation by injection of potassium permanganate was confirmed in a letter by the LARWQCB dated October 2016.

Several groundwater grab samples and soil vapor samples were collected at the Subject Site (Canoga Park High School) to delineate the extent of contamination and concentration of PCE associated with the release(s) from the dry cleaners. The sampling at the subject Site reported a maximum concentration of 82 µg/L of PCE in groundwater and 1.2 µg/L of PCE in soil vapor. Note, PCE in groundwater beneath the Site has not been completely assessed at Canoga Park High School due to an insufficient yield of groundwater during the investigation (Frey Environmental, Inc. [Frey] 2018).

In 2017, Office of Environmental Health Hazard Assessment (OEHHA) conducted vapor intrusion risk assessment and concluded that the risk estimates at the subject Site are less than one in one million and hazard indices are less than one.

In 2018, Frey prepared a Site Conceptual Model and Request for No Further Action (NFA) on behalf of the Vanowen Center, LLC. In the request for NFA, Frey argued that post-remediation concentration of PCE, and to a lesser extent, the other chlorinated VOCs in the soil, soil vapor, and groundwater beneath the Site, do not pose a risk to human health or the environment and recommended that NFA is considered for the Site. The LARWQCB has yet to respond to the request for NFA.

Based on this estimate, the potential health risks from vapor intrusion at the Site related with this release is below commonly accepted thresholds for schools and daycare. However, the property has not yet been granted NFA from the LARWQCB, and the PCE concentration in groundwater at subject Site has not been completely defined; therefore, the presence of PCE and other VOCs under the property is considered a potential REC for the Site pending the outcome of the regulatory process.

Regional Historical RECs:

Regional historical RECs also were identified at the Site. Historical RECs refer to a past release that has been remediated to below "residential" standards and given regulatory closure with no use restrictions. Four adjacent properties were found to be historical RECs for the subject Site:

1. **Former Thrifty Oil Station** (located at 6851 Topanga Canyon Boulevard, Canoga Park, CA). This property is located across Topanga Canyon Blvd to the west from the Site, reported a leaking UST in 1990. The property was subsequently remediated by soil excavation, soil-vapor extraction, and groundwater extraction. The case was closed in 2010 by the LARWQCB because the groundwater plume was stable and the subsurface lithology (tight silt and clay) limited the migration of contaminants. In February 1994, two wells (MW9 and MW10) were installed on the subject Site (Canoga Park HS), in the grass, across the street from the Thrifty Oil Station in a northeast down-gradient direction. The 2010 LARWQCB closure letter states that "MW9 and MW10 have shown [non-detect] ND for all fuel constituents since October 1994". However, the Geotracker groundwater monitoring well database (spanning from October 2001 to October 2009) shows concentrations of methyl-tert-butyl ether (MTBE) in well MW9 as late as November 2007 and in MW10 as late as June 2008. Due to these factors, this property is considered an HREC for the Site.
2. **Topanga Car Wash** (located at 6829 Topanga Canyon Boulevard, Canoga Park, CA). This property is located across Topanga Canyon Blvd west of the Site. There was a reported leaking gasoline UST in 1989, which could potentially impact an aquifer used for drinking water. A well installation workplan was submitted in 2010 and seventeen wells were

installed. Three of these wells: MW-16, MW-17, and MW-18, were placed on the Site (Canoga Park HS), in the grass, across the street from the car wash property. The groundwater in these wells was reported to contain gasoline related constituents between the period of 2004 to 2014. The property was subsequently remediated by several methods including free product recovery, dual phase extraction, and soil vapor extraction. In 2017, a well destruction report was submitted to the LARWQCB and the case was closed. The LARWQCB had determined that the contaminant plume was stable or decreasing in areal extent, that there was a low threat for the vapor-intrusion-to-air pathway, and there was a low threat for direct contact and outdoor air exposure. Due to these factors, this property is considered an HREC for the Site.

3. **Shell Service Station** (located at 22001 Vanowen Street., Canoga Park, CA). This property is also located across Topanga Canyon Blvd west of the Site, reported a leaking UST in 1987. The property was subsequently remediated by soil vapor and groundwater extraction, as well as soil excavation. In 1991, seven groundwater monitoring wells (B-11 through B-17) were constructed by Shell on the Site along Topanga Canyon Blvd. In 1997, due to diminished concentrations of contaminants in the groundwater, these monitoring wells were abandoned. The LARWQCB granted closure for the Shell property in 2013. Due to these factors, this property is considered an HREC for the Site.

4. **Former Union Oil Service Station – Currently known as Red Carpet Car Wash** (located at 6760 Topanga Canyon Blvd., Canoga Park, CA). This property, located across Vanowen Street is south of the Site has records listed from 1969 to 2014. The property reported a leaking gasoline UST in 1990 which could potentially impact an aquifer used for drinking water. The site was subsequently remediated using soil vapor extraction. The case was closed by the LARWQCB in September 2015. In March 2008, three monitoring wells (GW-7, GW-8, and GW-9) were installed on the subject Site in the north-northeast down-gradient direction—in the grass south of the Assembly Hall and across the street from the Union Oil Service Station. As late as April 2013, constituents such as MTBE, total petroleum hydrocarbons as gasoline (TPH-g), and tert-butyl alcohol (TBA) were found in these wells. Due to these factors, this property is considered an HREC for the Site.

Other Environmental Conditions:

Other Environmental Conditions (OECs) were identified at the Site during this assessment. OECs, or potential RECs, are features or issues that, while being judged to have a relatively low probability of resulting in significant impact to the Site, should be considered in project planning and risk management. The OECs listed below were identified at the Site.

1. **Lead-based Paint.** With the exception of newer portable buildings on the Site's, it is considered likely that the paint on the buildings contains, or formerly contained elevated lead concentrations. Due to slow deterioration with time, paint typically flakes off and accumulates in the adjoining soils. This can result in elevated lead concentrations in the soil. Note that the on-site buildings are mostly adjoined by asphalt pavement since 1959. As such, the potential that the soils underlying this pavement have been impacted with lead is considered relatively low. Elevated lead concentrations (greater than background levels), however, are possible in the planters that contain trees between the buildings, in former building areas, or any other unpaved areas adjoining the buildings.

2. **Arsenic-Based Herbicide.** It was formerly common practice for the LAUSD to apply an arsenic-based herbicide to the soil immediately prior to paving with asphalt. As such, there is a potential that elevated arsenic concentrations (greater than background levels) are present in the soils immediately underlying the paved portions of the Site.

3. **Organochlorine Pesticides.** It was formerly common practice for the LAUSD to apply termiticides around wooden structures at school sites as a means of pest control. As such, there is a potential that elevated OCP concentrations are present in site soils.

4. **Polychlorinated Biphenyls.** Four transformers were documented at different locations at the Site: 1) adjacent to the former boiler room; 2) at the northeast corner of Clrm Bldg #3; 3) at the northeast portion of the Site and northwest of the Owensmouth High School compound, and 4) east of Clrm Bldg #2 and just west of the athletic track field. Due to the age of most of the transformers, it is considered possible that they may have previously contained polychlorinated biphenyls (PCBs). The locations of these transformers are identified in Figure 3.

   Transformer oil releases were not observed beneath, or adjacent to, any of the transformers reviewed at the time of this assessment. The transformers were located on concrete foundations that adjoined paved areas.

5. **Radon.** The Site and its surrounding area are designated as high potential for indoor-radon levels above 4.0 picocuries per liter in recent alluvium (Radon Potential Zone Map for Southern Los Angeles County, California, California Geologic Survey, January 2005).

7.3 REGIONAL HAZARDOUS MATERIAL RELEASES

Based on a review of properties within the site vicinity and data made available during this assessment, there is a relatively low potential that contaminants from upgradient properties have impacted the soil or groundwater underlying the Site.

The Vanowen Plaza Property located at 22017 Vanowen Street (within the ¼ mile and upgradient of the Site), is currently being regulated by the LARWQCB as a result of hazardous material releases. As detailed in Section 7.2, subsurface site investigations conducted at this property showed that the soil, soil vapor, and groundwater are contaminated with perchloroethylene (PCE), trichloroethene (TCE) and other volatile organic compounds (VOCs) as a result of release(s) from the dry-cleaning operations. NFA requested for this property has not been granted by LARWQCB yet.

Other properties within the site vicinity have recorded information indicating releases of contaminants that have, or may have impacted the soil or groundwater underlying the Site are discussed in the Section regarding HRECs. The data and information reviewed on these other properties include closure or no-further-action determinations from the regulatory agency providing oversight. Site closure indicates the properties were remediated or evaluated to be at low risk, and therefore are not includes as potential RECs. This, however, does not assure that no impacts to the Subject Site are present.

7.4 RECOMMENDATIONS

The following recommendations are based on the findings and conclusions presented above.

- **Lead-Based Paint.** Prior to disturbing soil at the Site, it is recommended that representative soil samples be collected within the associated area(s) and analyzed for lead. The results of this investigation should be used to determine if the lead concentrations in soil in these areas are a potential threat to human health.
- **Arsenic.** Prior to disturbing any asphalt at the Site, it is recommended that representative soil samples be collected beneath the asphalt within the associated area(s) and analyzed for arsenic. The results of this investigation should be used to

determine if the arsenic concentrations in soil in these areas are a potential threat to human health.

- **OCPs**. Prior to their removal, it is recommended that representative soil samples be collected around wooden structures and analyzed for OCPs. The results of this investigation should be used to determine if the OCP concentrations in soil in these areas are a potential threat to human health.
- **Transformers.** If future construction activities encroach into the immediate vicinity of pad-mounted transformers, it is recommended that the adjoining soils be assessed for the possible presence of PCBs prior to disturbing the soil around the transformer. The results of this investigation should be used to determine if there are detectable concentrations of PCBs in this soil and if the detectable PCBs are a potential threat to human health.
- **Hydrocarbons**. Due to the previous use of the southern part of building Shop #2 as an auto shop, the presence of underground lifts, and an associated clarifier, this area was considered a potential REC. However, the extent of a potential leak is expected to be limited in the soils below the building due to the heavy nature of the hydraulic fluid. Assessment of the soils below the building and the clarifier for the possible presence of hydrocarbons is recommended if future construction activity planned will disturb the soil beneath the building.
- **Radon.** Due to the high potential for indoor-radon levels above 4.0 picocuries per liter at the Site and its surroundings, it is recommended that radon mitigation measures be included in any future buildings or additions.

8.0 LIMITATIONS

8.1 SIGNIFICANT ASSUMPTIONS

The ASTM E1527-13 standard ensures that the assessment methods used constitute appropriate inquiry consistent with good commercial and customary practice. It includes the review of prior uses of the property to identify and analyze environmental conditions that constitute past or potential environmental risks associated with the site property. Assessments conducted in accordance with this standard are intended to reduce, but not eliminate uncertainty, with respect to the potential for RECs associated with the site property.

8.2 LIMITATIONS AND EXCEPTIONS

The findings and opinions presented in this document pertain to site conditions at the time of this assessment. They should not be relied upon to represent conditions at substantially later dates. The opinions included are based on information obtained during the study and on the experience of professional personnel. If additional information becomes available that might impact environmental findings, then the opportunity to review the information, re-assess the potential concerns, and modify Eco's opinions (if warranted) will be requested.

Although this investigation has been an attempt to identify the potential for environmental impacts to the Site, potential sources of contamination may have escaped detection due to one or more of the following:

- The limited scope of this assessment
- The inaccuracy of public records

- Presence of undetected or unreported environmental incidents

It was not within the scope of this assessment to address non-ASTM issues such as lead-based paint and asbestos-containing materials in buildings, naturally occurring hazardous materials, or vegetation and wetlands. Further, it was not the purpose of this assessment to determine the actual presence, degree, or extent of contamination at the Site.

8.3 SIGNIFICANT DATA GAPS

Significant data gaps were not identified during the preparation of this Phase I ESA. Data gaps to the standard for this report include the following:

- Interviews with adjoining property representatives
- Assessment of the Site's purchase price and the fair market value

8.4 ADDITIONAL SERVICES

No additional services were included with the Phase I portion of this ESA.

8.5 SPECIAL TERMS AND CONDITIONS

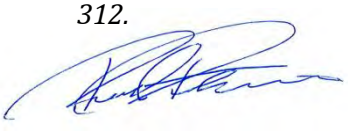
No special terms or conditions apply to the preparation of this report.

8.6 USER RELIANCE

The findings and conclusions presented in this report represent the best professional judgment of the Environmental Professional based on the conditions that existed during the assessment and the information available during the course of the assessment. Information regarding operations, conditions, and test data provided by the client, owner, or other representative has been assumed to be correct and complete.

This report may be distributed and relied upon by LAUSD, its successors, and assignees. Reliance on the information and conclusions presented in this report by any other party is not authorized without the written consent of Eco & Associates, Inc.

9.0 ENVIRONMENTAL PROFESSIONAL QUALIFICATIONS AND SIGNATURE



This Phase I Environmental Site Assessment Report was prepared by Mr. Paul Peterson, an Environmental Professional who possesses sufficient specific education, training, and experience necessary to exercise professional judgment to develop opinions and conclusions regarding conditions indicative of hazardous material releases or threatened releases on, at, in, or to property. He is sufficiently qualified to meet the objectives and performance of this assessment. Mr. Peterson holds a current Professional Geologist's license (PG# 7508) in California and has more than 24 years of full-time relevant experience. He obtained a Bachelor of Science Degree in Geological Sciences from California State University in Northridge, California, and has continued to build on his environmental-related knowledge through participation in continuing education and work-related experience.

As required by 40 Code of Federal Regulations (CFR) 312.21(d) and Section 12.2 of the ASTM E1527-13, the environmental professional's statement and signature are provided below.

In support of the contents of this report:

> *I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312; and I have the specific*

qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. I have developed and performed the all appropriate inquiries in conformance to the standards and practices set forth in 40 CFR Part 312.

Paul Peterson, PG #7508
Senior Project Geologist

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR Chain of Title

The EDR Chain of Title Report tracks a line of successive owners from the present back to 1940 of a particular parcel of property, linked together by recorded transactions which pass title. Available nationwide, this report provides a summary of a property's ownership history and is a valuable source for determining the prior uses of a property.

A network of professional abstractors following established procedures, uses client supplied address information to locate:

- Historical Chain of Title research
- Leases and Miscellaneous

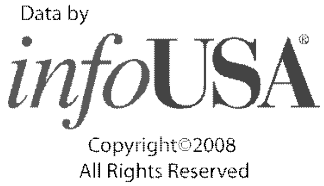
EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.



Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 08/13/2018 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1

RCRA-TSDF site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 3 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/01/2018 has revealed that there are 9 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/01/2018 has revealed that there is 1 RCRA-CESQG site within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

CA ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the CA ENVIROSTOR list, as provided by EDR, and dated 07/30/2018 has revealed that there are 8 CA ENVIROSTOR sites within approximately 1 mile of the target property.

State and tribal leaking storage tank lists

CA LUST: Leaking Underground Storage Tank (LUST) Sites included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CA LUST list, as provided by EDR, has revealed that there are 33 CA LUST sites within approximately 0.5 miles of the target property.

CA CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CA CPS-SLIC list, as provided by EDR, has revealed that there are 10 CA CPS-SLIC sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

CA UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the CA UST list, as provided by EDR, has revealed that there are 6 CA UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/01/2018 has revealed that there are 3 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

CA DRYCLEANERS: A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaners' agents; linen supply; coin-operated laundries and cleaning; drycleaning plants except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.

A review of the CA DRYCLEANERS list, as provided by EDR, has revealed that there are 10 CA DRYCLEANERS sites within approximately 0.25 miles of the target property.

EXECUTIVE SUMMARY

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Auto: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Auto list, as provided by EDR, has revealed that there are 8 EDR Hist Auto sites within approximately 0.125 miles of the target property.

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D018
. Waste name: BENZENE

Violation Status: No violations found

FINDS:

Registry ID: 110013309197

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

FINDS:

Registry ID: 110002774383

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Longitude: -118.606774331352
Case Type: Cleanup Program Site
Case Worker: BA
Local Agency: Not reported
RB Case Number: 1153
File Location: Regional Board
Potential Media Affected: Aquifer used for drinking water supply, Soil, Soil Vapor
Potential Contaminants of Concern: Other Chlorinated Hydrocarbons, Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History: The site is a single, three-story structure and is occupied by shops on the main floors and offices on the upper floors. The building was constructed in approximately 1963 and various dry cleaners (first White Angel Cleaners and later N & E Cleaners) occupied a unit in the building and operated a dry cleaning business since approximately

WHITE ANGEL CLEANERS (Continued) **1000819177**

1992. N & E Cleaners have been operating in the unit since approximately 2001. A Phase I environmental site assessment (ESA) conducted in 2002 for property transaction indicated the existence of recognized environmental conditions. Subsurface site investigations conducted afterwards in 2002, 2003 and 2007 showed that the soil, soil vapor and groundwater are contaminated with perchloroethylene (PCE), trichloroethene (TCE) and other volatile organic compounds (VOCs) as a result of release(s) from the dry cleaning operations. The site investigations involved soil vapor survey, soil and groundwater sampling and installation of groundwater monitoring wells. Groundwater monitoring has been conducted at the site since 2005 and site investigations are still underway.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

AEROJET ROCKETDYNE OF DE INC (Continued) **S101540004**

Local Agency:	Not reported
RB Case Number:	0237A
File Location:	Regional Board
Potential Media Affected:	Aquifer used for drinking water supply, Soil, Soil Vapor
Potential Contaminants of Concern:	Tetrachloroethylene (PCE), Trichloroethylene (TCE), Total Petroleum Hydrocarbons (TPH)
Site History:	The site is approximately 47-acres and was developed in the mid-1950s for the manufacture of rocket engines and related systems. Operations at the site concluded in 2014. The currently idle site contains numerous vacant industrial buildings and structures in various states of disrepair, surrounded by surface parking lots along Canoga Avenue and Victory Boulevard. Numerous environmental investigations and cleanup activities have been conducted across the Site since 1984 that have identified elevated levels of chemicals of potential concern (COPCs), including chlorinated solvents from historic manufacturing activities at the site. Soil and groundwater cleanup activities are currently ongoing at the subject site.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

. Waste code: D001
. Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

. Waste code: D002
. Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

. Waste code: D003
. Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

. Waste code: D006

FINDS:

Registry ID: 110002425199

Environmental Interest/Information System
NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

AIR EMISSIONS CLASSIFICATION UNKNOWN

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

BOEING NORTH AMERICAN ROCKETDYNE (Continued) **1000273223**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Completed Document Type:	Phase 1
Completed Date:	12/20/1995
Comments:	Pursuant to the MOU, DTSC has reviewed a Phase I Site Assessment for El Proyecto del Barrio (EPB). The subject property currently contains a vacant one-story hospital building. EPB is proposing to demolish the building in order to construct a new comprehensive health services center on the site to be owned and operated by EPB. A Supplemental Phase I Environmental Assessment Report was prepared by DTSC and concluded that no action was needed for this property; there is no contamination on the property.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.
