Alternate Address: 2800 KERR STREET
Alternate City,St,Zip: LOS ANGELES, CA 90039
Background Info: Other agencies involved at the site include the RWQCB which conducted a Toxic Pits Cleanup Act (TPCA) closure on four lined sumps.
This site is located within the San Fernando Groundwater Basin and partially within Pollock NPL site U.S. EPA. The groundwater underlying the site is contaminated.
Not reported
This site is the active or operational portion of a 243-acre rail yard. Routine maintenance and major diesel locomotive service and repair have been conducted at this site for nearly 100 years. Areas of concern include large holding ponds, several former aboveground and underground tank locations and a rubbish pile. Contaminants are principally oil, grease, and diesel from fueling areas, spills, or as a result of derailments. In addition, solvents that were used as cleaning agents or in metal work are potential contaminants in maintenance areas. Wastewater treatment ponds and rubbish piles are potential sources of groundwater contamination.
Possible exposure pathways include direct contact, groundwater, and possible surface runoff into the Los Angeles River. Possible receptors include workers and visitors to the site and downgradient groundwater users. There are also potential environmental impacts to wetland areas adjacent to the Los Angeles River.
Past activities at the site include a Hydrological Assessment Report (HAR) conducted for the RWQCB, ballast removal, soil analysis of contaminated areas underlying track in the maintenance yard, and treatability studies. An Enforceable Agreement was entered into in April 1990.
Comments Date: 03191996
Comments: approximately 1 month before the area is sampled.

CA BOND EXP. PLAN:

Responsible Party: RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: The responsible party is Southern Pacific Transportation Company. DHS will be issuing a remedial action order or entering into an enforceable agreement with the responsible party. DHS has budgeted \$75,000 for oversight/monitoring of the IRM cleanup efforts. DHS will recover 100 percent of direct costs plus staff costs and overhead related to the project. The responsible party will pay all costs associated with the remedial investigation and site remediation activities.
Site Description: Southern Pacific Transportation Company, Taylor Yard, is a diesel engine repair yard.
Hazardous Waste Desc: The major contaminants are oil and grease, and small amounts of heavy metals. Solvents are suspected contaminants. The site area requiring immediate remediation (IRMs) contains railroad ballast which was excavated when new ties were placed. The contaminated ballast is piled on concrete pads onsite awaiting treatment (a method of soil-washing). A preliminary assessment/site investigation must be conducted to characterize the nature and general extent of the contamination of the entire site.
Threat To Public Health & Env: The site is located near the Los Angeles River which is not used for drinking water supplies. Contaminant migration is possible via airborne emissions and ground water. Ground water contamination is suspected but has not yet been verified.
Site Activity Status: DHS is acting in an advisory role for the interim remedial measures. The responsible party requested a variance for the soil-washing treatment process (the interim remedial measure). DHS granted the variance and Southern Pacific Transportation Company has commenced the soil-washing treatment.

Summary Details:

Conditions at proposal (October 15, 1984): San Fernando Valley Area 4) is an area of contaminated ground water in the Pollock Well Field area in the City of Los Angeles, Los Angeles County, California. The area is part of the San Fernando Valley Basin, a natural underground reservoir that represents an important source of drinking water for at least 3 million people in the Los Angeles metropolitan area. The contaminated ground water, which underlies an

area of approximately 5,860 acres, contains perchloroethylene PCE), according to tests conducted by the California Department of Health Services, as well as numerous local government agencies. The State's recommended drinking water guideline for PCE (4 parts per billion) is exceeded in a number of public wells in this area. To alleviate this contamination, wells are either taken out of service or blended with water from clean sources to ensure that the public receives water with concentrations below the State's guideline. Status June 10, 1986): EPA and the Los Angeles Department of Water and Power are entering into a cooperative agreement for a remedial investigation of the San Fernando Valley Basin and a feasibility study targeted at Area 1, the most contaminated area. The RI is scheduled to begin in early 1986.

Background Info:

The San Fernando Valley Ground Water Basin (SFVGWB) is located within the Upper Los Angeles River Area and consists of the eastern portion of the San Fernando Valley and the entire Verdugo Basin. The SFVGWB encompasses approximately 112,000 acres of alluvial valley fill deposits and provides enough water to serve approximately 600,000 residents. The Basin is bounded on the north and the northwest by the Santa Susana Mountains, on the northeast by the San Gabriel Mountains, on the west by the Simi Hills and on the south by the Santa Monica Mountains.

The San Fernando Valley Study area includes four National Priorities List (NPL) sites. They are:

Area #1 - North Hollywood NPL Site covers 9336 acres in the eastern part of the San Fernando Valley. The site has been divide into the North Hollywood Operable Unit (OU) and the Burbank OU

Area #2 - Crystal Springs NPL Site covers 3975 acres southeast of the North Hollywood NPL Site and is located in the cities of Glendale and Los Angeles.

Area #3 - Verdugo NPL Site covers 2673 acres in the eastern part of the San Fernando Valley and is located in and adjacent to La Crescenta in the Verdugo Mountains.

Area #4 - the Pollock NPL Site covers 1635 acres in the southeastern part of the San Fernando Valley and is located in and adjacent to the cities of Los Angeles and Glendale.

Groundwater contamination in the SFVGWB is linked to prewar, postwar, and current industrialization in the San Fernando Valley.

The contaminants of concern are volatile organic compounds (VOCs), trichloroethylene (TCE) and tetrachloroethylene (PCE) which have been and/or are being used in many San Fernando Valley industries, such as aeronautical, automotive, dry cleaning, and metal plating. These solvents have found their way to the groundwater basin as a result of both past and improper use, storage and disposal practices. The SFVGWB Superfund sites, added to the NPL in 1986, are areas where groundwater from wells have been found to contain VOCs above the state and federal drinking water standards. Groundwater contamination at numerous wells have been so severe with TCE and PCE that these wells have essentialput out of commission.

Exposure of receptors to contaminants can possibly occur through ingestion of contaminated drinking water, inhalation of VOCs released from the contaminated water as in taking showers, and dermal exposure as in washing or bathing. However, with the strict regulatory control over water quality by the State's Department of Health, Office of Drinking Water (ODW), the RWQCB, and other agencies, residents are assured that the water they consume is safe and that no one is drinking water which contains concentrations of contaminants above regulatory standards. Federal, state, and local agencies have been conducting

investigation and cleanup of contaminated groundwater in the SFVSWB since contamination was discovered in 1979. These activities involve measuring the extent of contamination, developing & implementing cleanup remedies, and identifying responsible parties.

EPA provided oversight of the basinwide Remedial investigation (RI) of groundwater contamination conducted by the Los Angeles Department of Water and Power (LADWP). The RI objectives were to collect lithological and water quality data and information regarding basin operations for the eastern SF and Verdugo basins; develop a regional characterization of geology, hydrology, and the nature and extent of groundwater contamination within the eastern and Verdugo basins; study fate and transport of compounds in the environment; identify ARARs; and evaluate the potential risk to human health and the environment. The Remedial Investigations of the SFVSWB were divided into two phases:

Phase I activities have included vertical profile borings and installation of monitoring wells to obtain preliminary contaminant information. Monitoring wells have been installed as follows: 34 in North Hollywood (Area #1); 29 in Crystal Springs (Area #2); 7 in Verdugo (Area #3); and 17 in Pollock (Area #4). Information obtained from Phase I investigation activities identified the need for several operable units. Operable Unit is a federal term which is similar to the State's definition of a removal action.

Phase II activities consist of a basinwide remedial investigation conducted by LADWP.

Remedial Actions (RAs):

North Hollywood (Area #1) -- Two RAs were identified for Area #1, the North Hollywood OU and the Burbank OU.

A Record of Decision (ROD) for the North Hollywood RA was signed in September 1987, selecting groundwater extraction and treatment (air stripping) of 2,000 gallons per minute (gpm) of contaminated water as an interim remedy. This RA was constructed with funding from EPA and the State and has been treating contaminated groundwater since March 1989. This facility is located at 11845 Vose Street in the N. Hollywood section of Los Angeles.

A ROD for the Burbank OU was signed in June 1989, again selecting groundwater extraction and treatment of about 12,000 gpm of contaminated water. Negotiations are continuing with PRPs for the design and construction of this RA.

Crystal Springs (Area #2) -- LADWP has completed a focused RI/FS for this proposed RA. The Glendale OU was separated into a North OU and a South OU based on the amount of contamination and the facilities contributing to the GW contamination. A ROD for each OU was signed on June 18, 1993 designating groundwater extraction and treatment as the interim remedy. The PRPs formed a group and combined the RA efforts for each OU into one document. The selected alternative is GW extraction and treatment.

Verdugo and Pollock (Areas #3 and #4) -- Currently no RAs have been identified for Area #3 or for Area #4.

In October 2003, US EPA proposed No Remedial Action for Verdugo Basin (Area #3).

EPA and the RWQCB are identifying potential sources of

contamination and pursuing PRPs that may be responsible for contaminating groundwater. As these PRPs are identified, individual site investigations and mitigation activities will be pursued. Enforceable agreements and orders have been implemented at numerous specific potential source sites within the Basin by RWQCB and the Department.

Environmental Interest/Information System:

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

STATE MASTER

HAZARDOUS WASTE BIENNIAL REPORTER

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Senate District: 24
Assembly District: 51
Public Information Officer: Not reported
Commercial Offsite Facility Types: Solvent Recovery
Quarterly Update: QUARTERLY UPDATE Quarterly Update Period: April 2021 to June 2021
Permit Renewal: On September 22, 2020, the Department of Toxic Substances Control (DTSC) issued a RCRA Hazardous Waste Permit (Permit) to Safety-Kleen Systems Inc. The expiration date for the Permit is October 24, 2030. FACILITY DESCRIPTION/HISTORY Safety-Kleen Systems, Inc. Los Angeles (Facility) is located at the northeast corner of Ripple Street and Worthen Avenue, west of Gilroy Street. The Facility is located approximately 180 yards northeast of Golden State Freeway 1-5 and approximately 180 yards west of Glendale Freeway 2. Other streets in the neighborhood include Clearwater Street (industrial area), Glenview Avenue (residential neighborhood), Fruitdale Street (industrial area), Fletcher Drive (industrial area) and Crystal Street (industrial area), and Gilroy Street (mixed residential and industrial areas). Safety-Kleen began operation at this Facility in June 1978. The Facility is categorized as a small storage facility. Safety-Kleen provides mineral spirit solvent reclamation and supply service for customers primarily engaged in vehicle repair shops, industrial maintenance, and dry cleaning. The Facility provides customers with parts cleaning services, which involve parts degreasing units, consisting of a sink affixed to the top of a 16- or 30-gallon drum of cleaner solvent at the customer's location. The Facility also provides customers with aqueous-based parts washing solution and immersion cleaners (carburetor cleaner) for use in the degreasing units. The units are emptied and the hazardous materials are refilled by the Safety-Kleen truck operators at the customer's location, and the trucks transport the used materials back to the Facility. The hazardous waste solvents from the Facility are eventually transported to the Safety-Kleen's Reedley Recycle Center or another permitted facility for recycling, treatment and/or disposal. The Facility stores and transfers hazardous wastes in three units as described below: Unit 1: Underground Was

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.

Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or those who must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Completed Document Type: Public Participation Plan / Community Relations Plan
Completed Date: 11/01/2007
Comments: DTSC approved the Public Participation Plan, dated November 2007.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Plan
Completed Date: 03/14/2011
Comments: Via email on March 14,2011, DTSC concurred with the revised O&M Plan provided LAUSD complies with four comments. The O&M Plan proposes installation and quarterly sampling of soil vapor probes at seven locations and three groundwater monitoring wells. In addition, DTSC requested that LAUSD provide the signed O&M Agreement immediately for full execution.

Completed Sub Area Name: Not reported
Completed Document Type: 5 Year Review Workplan
Completed Date: 06/21/2012
Comments: Via email on June 21, 2012, DTSC waived the requirement to submit a Five-Year Review Workplan at this time but indicated that a Five-Year Review evaluation should be included in the next (annual) O&M Report, which is due in February 2013.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 08/31/2011
Comments: DTSC reviewed the Operation and Maintenance Report and requested that the provided comments be addressed in future monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 11/29/2011
Comments: DTSC reviewed the Operation and Maintenance report and had no comments.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 03/06/2012
Comments: DTSC reviewed the Operation and Maintenance Report and determined that continued monitoring on a quarterly frequency is necessary. DTSC also requested that the provided comments be addressed in future monitoring reports. On April 23, 2012, DTSC concurred with LAUSD's April 10, 2012 proposal to reduce monitoring to an annual basis.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 03/05/2013
Comments: DTSC reviewed the Operation and Maintenance Report and indicated that monitoring continue for another year at all soil vapor and groundwater monitoring locations. DTSC also requested that the provided comments be addressed in future monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 04/15/2014
Comments: DTSC reviewed the Operation and Maintenance Report and recommended that soil vapor and groundwater monitoring continue at all monitoring locations on an annual basis until concentrations are below Site-Specific Action Levels. DTSC also requested that the provided comments be addressed in future monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 04/01/2015
Comments: DTSC reviewed the Operation and Maintenance Report, suggested a reduced monitoring program, and requested that the comments provided

be addressed in future monitoring reports. DTSC anticipates the next monitoring event to be conducted in January 2016.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 08/01/2016
Comments: DTSC reviewed the Operation and Maintenance Report and provided comments on the Report for the record. In addition, DTSC determined that no further action is necessary for the Site provided LAUSD executes an access agreement for continued monitoring as it appears that an increasing trend of PCE in soil vapor may be due to an off-site source.

Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 09/22/2015
Comments: Annual Cost Estimate emailed and mailed to LAUSD.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Correspondence
Completed Date: 08/01/2016
Comments: In a letter, dated August 1, 2016, DTSC provided its final response regarding LAUSD's request to terminate O&M activities at the Site. Overall, it appears that VOC concentrations in groundwater and soil vapor do not appear to pose a health risk to receptors at the school. Thus, DTSC determined that no further action is necessary for the Site provided LAUSD executes an access agreement for continued monitoring as it appears that an increasing trend of PCE in soil vapor may be due to an off-site source. DTSC will certify the Site after confirmation of an executed access agreement.

Completed Document Type: Operation and Maintenance Plan
Completed Date: 03/14/2011
Comments: Via email on March 14, 2011, DTSC concurred with the revised O&M Plan provided LAUSD complies with four comments. The O&M Plan proposes installation and quarterly sampling of soil vapor probes at seven locations and three groundwater monitoring wells. In addition, DTSC requested that LAUSD provide the signed O&M Agreement immediately for full execution.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 06/08/2011
Comments: DTSC reviewed the Operation and Maintenance Report and requested that the provided comments be addressed in future monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 5 Year Review Reports
Completed Date: 04/11/2013
Comments: On April 11, 2013, DTSC identified discrepancies in the Five-Year Review Report and indicated such be addressed in future O&M Reports and/or Five-Year Review Reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 5 Year Review Workplan
Completed Date: 06/21/2012
Comments: Via email on June 21, 2012, DTSC waived the requirement to submit a Five-Year Review Workplan at this time but indicated that a Five-Year Review evaluation should be included in the next (annual) O&M Report, which is due in February 2013.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 08/31/2011
Comments: DTSC reviewed the Operation and Maintenance Report and requested that the provided comments be addressed in future monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 11/29/2011
Comments: DTSC reviewed the Operation and Maintenance report and had no comments.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 03/06/2012
Comments: DTSC reviewed the Operation and Maintenance Report and determined that continued monitoring on a quarterly frequency is necessary. DTSC also requested that the provided comments be addressed in future monitoring reports. On April 23, 2012, DTSC concurred with LAUSD's April 10, 2012 proposal to reduce monitoring to an annual basis.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 03/05/2013
Comments: DTSC reviewed the Operation and Maintenance Report and indicated that monitoring continue for another year at all soil vapor and groundwater monitoring locations. DTSC also requested that the provided comments be addressed in future monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 04/15/2014
Comments: DTSC reviewed the Operation and Maintenance Report and recommended that soil vapor and groundwater monitoring continue at all monitoring locations on an annual basis until concentrations are below Site-Specific Action Levels. DTSC also requested that the provided comments be addressed in future monitoring reports.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 04/01/2015
Comments: DTSC reviewed the Operation and Maintenance Report, suggested a reduced monitoring program, and requested that the comments provided be addressed in future monitoring reports. DTSC anticipates the next monitoring event to be conducted in January 2016.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operation and Maintenance Report
Completed Date: 08/01/2016
Comments: DTSC reviewed the Operation and Maintenance Report and provided comments on the Report for the record. In addition, DTSC determined that no further action is necessary for the Site provided LAUSD executes an access agreement for continued monitoring as it appears that an increasing trend of PCE in soil vapor may be due to an off-site source.

Completed Sub Area Name: Not reported
Completed Document Type: Annual Oversight Cost Estimate
Completed Date: 09/22/2015
Comments: Annual Cost Estimate emailed and mailed to LAUSD.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Correspondence
Completed Date: 08/01/2016
Comments: In a letter, dated August 1, 2016, DTSC provided its final response regarding LAUSD's request to terminate O&M activities at the Site. Overall, it appears that VOC concentrations in groundwater and soil vapor do not appear to pose a health risk to receptors at the school. Thus, DTSC determined that no further action is necessary for the Site provided LAUSD executes an access agreement for continued monitoring as it appears that an increasing trend of PCE in soil vapor may be due to an off-site source. DTSC will certify the Site after confirmation of an executed access agreement.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly known as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

HIST FTTS INSP: FIFRA/TSCA Tracking System Inspection & Enforcement Case Listing

A complete inspection and enforcement case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Northwest Map: 12021683 BURBANK, CA
Version Date: 2018

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General South

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Flood Plain Panel at Target Property</u>	<u>FEMA Source Type</u>

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u>	<u>NWI Electronic</u>
LOS ANGELES	<u>Data Coverage</u>
	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION</u>	<u>GENERAL DIRECTION</u>
	<u>FROM TP</u>	<u>GROUNDWATER FLOW</u>
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Cenozoic
System: Quaternary
Series: Quaternary
Code: Q (*decoded above as Era, System & Series*)

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: URBAN LAND

Soil Surface Texture: variable

Hydrologic Group: Not reported

Soil Drainage Class: Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: Not Reported

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 10 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	6 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: sandy loam
 gravelly - sandy loam
 silt loam
 clay
 fine sand
 gravelly - sand
 sand
 fine sandy loam

Surficial Soil Types: sandy loam
 gravelly - sandy loam
 silt loam
 clay
 fine sand
 gravelly - sand

 fine sandy loam

Shallow Soil Types: fine sandy loam
 gravelly - loam
 sandy clay
 sandy clay loam
 clay
 silty clay
 sand

Deeper Soil Types: gravelly - sandy loam
 sandy loam
 very gravelly - sandy loam
 stratified
 very fine sandy loam
 weathered bedrock
 sand
 gravelly - fine sandy loam
 silty clay loam
 clay loam

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map

Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.

Source: FEMA

Telephone: 877-336-2627

Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

APPENDIX E

LAUSD Radon Memorandum

INTEROFFICE CORRESPONDENCE
Los Angeles Unified School District
Office of Environmental Health and Safety

TO: Leah Guthrie
Facilities Development Manager
Facilities Services Division - Asset Management

DATE: Mar. 21, 2022

FROM: Lawrence Browne LB
Site Assessment Project Manager, Contract Professional
Office of Environmental Health and Safety, Site Assessment

SITE: **IRVING STEAM MIDDLE SCHOOL - RADON DETERMINATION**

This interoffice correspondence from the Office of Environmental Health and Safety (OEHS) has been prepared for the determination of radon at Irving STEAM Middle School located at 3010 Estara Avenue, Los Angeles, California 90065.

There are three radon zones designated as high, moderate, and low within the boundaries of the Los Angeles Unified School District. OEHS has determined that Irving STEAM Middle School is within a "high radon zone". The high radon zone is defined as having a high potential for radon levels to be above 4 picocuries per liter (pCi/L).

The high radon zone designation was made by OEHS utilizing the radon map within the California Department of Conservation website¹ and the OEHS-produced District-wide radon map from March 2016 that utilized the following sources:

- 1) Radon Data by Zip Code, California Department of Public Health Indoor Radon Program, February 2016² (result - 1 test in 45 above 4 pCi/L for Zip code 90001);
- 2) Radon Data for Palos Verdes Peninsula, 2012³; and,
- 3) Special Report #182, Radon Potential in for Southern Los Angeles County, California Department of Conservation, California Geological Survey⁴, 2005.

As stated in Los Angeles Unified School District Reference Guide REF-5314.2⁵
Procedures for Environmental Review of Proposed Projects:

Building Design and Construction Measures – Should a building or similar structure be constructed or renovated for student and/or staff occupancy and is located in a “high” radon zone, U.S. Environmental Protection Agency (EPA) guidance entitled “*Radon Prevention in the Design and Construction of Schools and Other Large Buildings, EPA/625/R-92/016, June 1994*” (or latest published version) shall be reviewed and all relevant and appropriate measures incorporated in its design and construction to prevent radon gas infiltration.

Project File

APPENDIX F

CDE Screening Checklist

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Washington Irving Magnet Middle School

Selection Criteria	Yes	No	Comments
High Voltage Power Transmission Lines [CCR, Title 5, 14010(c)]			
Will the project create or exacerbate any health risks from 50-133 kV power lines within 100 feet of the site?		X	No nearby high voltage power lines identified.
Will the project create or exacerbate any health risks from 220-230 kV power lines within 150 feet of the site?		X	No nearby high voltage power lines identified.
Will the project create or exacerbate any health risks from 500-550 kV power lines within 350 feet of the site?		X	No nearby high voltage power lines identified.
Railroads [CCR, Title 5, 14010(d)]			
Will the project create or exacerbate any safety risks from railroads within 1,500 feet of the site?		X	There are no railroads within 1,500 of the site. Nearest railroad is located approximately 1,800-feet south from the site.
Traffic Noise [CCR, Title 5, 14010(e)]			
Will the project create or exacerbate any noise impacts from adjacent roads or freeways that will adversely affect the educational program?		X	In the opinion of Eco this project is unlikely to exacerbate any noise impacts. However, the full extent of the modernization program is unknown.
Faults [CCR, Title 5, 14010(f)]			
Will the project create or exacerbate and safety risks from active fault traces which may be onsite?		X	According to the California Department of Conservation Fault Activity Map of California, the Site lies on or very near the Raymond Fault.
Flood or Inundation Area [CCR, Title 5, 14010(g)]			
Will the project create or exacerbate safety risks from flooding or dam inundation?		X	The Site is not located in a flood hazard zone or in proximity to a dam.
Pipelines and Above Ground Tanks [CCR, Title 5, 14010(h)]			
Will the project create or exacerbate safety risks from nearby above ground water or fuel storage tanks?		X	No nearby aboveground water or fuel storage tanks were observed.
Will the project create or exacerbate safety risks from high-pressure hazardous material pipelines located within 1,500 feet of the site?		X	No high-pressure hazardous material pipelines should be located within 1,500 feet of an existing school. None were identified by Eco.
Liquefaction and Landslides [CCR, Title 5, 14010(i)]			
Will the project create or exacerbate safety risks from liquefaction or landslides?		X	The site is located 0.25-mile from a liquefaction zone, but not in a landslide zone. In the opinion of Eco the project should not exacerbate these safety risks.
Traffic and Pedestrian Safety [CCR, Title 5, 14010(l)]			
Will the project create or exacerbate traffic/pedestrian safety risks from an adjacent major arterial street?		X	There is no major adjacent arterial streets.

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Washington Irving Magnet Middle School

Selection Criteria	Yes	No	Comments
Compatible Zoning [CCR, Title 5, 14010(m)]			
Will the project create or exacerbate health or safety risks from the zoning surrounding the site?		X	In the opinion of Eco the project should not affect health or safety risks regarding the zoning surrounding the site.
Light, Wind, Air Pollution [CCR, Title 5, 14010(q)]			
Will the project create or exacerbate impacts from light, wind, or air pollution?		X	In the opinion of Eco the project should not affect impacts from light or wind. Impacts to air pollution are unknown.
Easements [CCR, Title 5, 14010(r)]			
Will the project create or exacerbate impacts from easements on or adjacent to the site which may restrict access or building placement?		X	Onsite easements were not identified.
Border Zone Property [CCR, Title 5, 14010(t)]			
Will the project create or exacerbate health and safety risks from a significant disposal of hazardous waste within 2,000 ft. of the site?		X	According to the EDR report no significant disposal of hazardous waste occurs within 2,000 feet of the site.
Cellular Phone Towers [LAUSD Board Resolution]			
Will the project create or exacerbate health risks from a cellular phone tower on or adjacent to the site?		X	No cell phone towers were observed on or adjacent to the site.
Methane Zone			
Will the project create or exacerbate health and safety risks from a known methane zone or oil field?		X	The site is not within a methane zone or oil field.
Oil Wells			
Will the project create or exacerbate health and safety risks from an onsite oil well?		X	There are no nearby or onsite oil wells.
Air Pollution [LAUSD Board Resolution]			
Will the project create or exacerbate health risks from a major transportation corridor (freeway, major rail line) within 500 feet?		X	Unknown. The site is located adjacent, at the southwest corner, to the Glendale Freeway.
Will the project create or exacerbate health risks from a major stationary source of emissions within 500 feet?		X	There are no major stationary sources of emissions within 500 feet of the site.

Preliminary Environmental Screening of Proposed Project at Existing School Site

Project: Washington Irving Magnet Middle School .

Selection Criteria	Yes	No	Comments
Is the school on the Priority List of Schools Most at Risk from Air Pollution?		X	Unknown.
Will the project create or exacerbate health risks from a high-risk facility previously identified by OEHS?		X	It is unknown if a high-risk facility was previously identified by OEHS. None were identified by Eco.
Airports			
[CCR, Title 5, 14010(t)]			
Will the project create or exacerbate health and safety risks from an airport within two nautical miles of the site?		X	There are no airports within two nautical miles of the site.

EXECUTIVE SUMMARY

This Historic Resource Evaluation Report (HRER) summarizes a historical resources study for Washington Irving Middle School (Irving MS), located at 3010 Estara Avenue in Los Angeles, California (APN 5458-019-900). Los Angeles Unified School District (LAUSD) requested this evaluation to help identify and document historical resources on the campus, which is slated for upcoming projects. The buildings evaluated are the Auditorium, Administration, Physical Education building, Cafeteria, and two Shops. This documentation ensures consideration of any buildings more than 45 years of age within the campus and was guided by the *LAUSD Historic Context Statement, 1870 to 1969* (Sapphos 2014). This assessment was prepared by ASM Affiliates (ASM) to determine the historical resource/historic property status of the original buildings of the Irving MS, both individually and as potential contributors to a historic district, and to facilitate LAUSD compliance with the California Environmental Quality Act (CEQA) and National Historic Preservation Act (NHPA).

Brief Overview of Campus

The core of the Irving MS campus comprises four major original buildings located on the east side of the property. The Public Works Administration (PWA) Moderne campus core was constructed from 1936 through 1939. Two additional 1937 utilitarian shop buildings (Shop No. 1 and Shop No. 2), two playing fields, basketball courts, various classroom buildings, and surface parking lots occupy the remainder of the campus. The original campus buildings are a main administration/classroom (Administration) building, an auditorium/assembly hall (Auditorium), and a gymnasium (Physical Education) building. These three buildings are two stories in height. A fourth building, the Cafeteria, is located northwest of the Administration building. It was added a year later and follows the design motifs of the original buildings, with subtle variations. Two small shop buildings were designed and built concurrent with the cafeteria. The four major original buildings form a cohesive group of clearly related buildings with differentiated functions. Taken as a whole, the buildings comprised all of the components of a functioning middle school. Shop No. 1 and Shop No. 2 are ancillary utilitarian buildings that were constructed at the same time. Other buildings on the campus are much simpler in design and architectural expression and appear to date from later periods.

Summary of Findings

ASM carefully considered the eligibility of the Irving MS campus and its individual components as potentially significant under National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) Criteria A/1, B/2, C/3, and D/4; City of Los Angeles Historic Cultural Monument (HCM) Criteria a–d; and as CEQA-defined historical resources and NHPA-defined historic properties. The evaluation was conducted in conformance with NRHP Bulletin *How to Apply the National Register Criteria for Evaluation* (National Park Service Bulletin No. 15 1997), the California Office of Historic Preservation's *Instructions for Recording Historical Resources* (1995), and Technical Assistance Series #7 *How to Nominate a Resource to the California Register of Historical Resources* (2001).

ASM referred to the *LAUSD Historic Context Statement, 1870 to 1969* (Sapphos 2014) for guidance in the full evaluation of the six buildings as potentially individually eligible and the campus as a historic district within the context of LAUSD's nearly 800 campuses. To summarize the findings of this HRER, ASM prepared California Department of Parks and Recreation (DPR) forms, including A and BSO forms and a District form (Appendix A).

As a result of the research conducted for this report, ASM recommends that Irving MS is an outstanding representation of the applicable contexts and themes established in the *LAUSD Historic Context Statement*. A portion of the campus appears to be eligible as a historic district, with none of the contributors recommended as individually eligible, under NRHP and CRHR Criteria A/1 and C/3, and as a City of Los

Angeles HCM Criteria a–d. The campus therefore qualifies as a historical resource pursuant to CEQA and as a historic property pursuant to the NHPA.

Key Staff

This HRER was prepared by ASM staff who meet the qualifications of the Secretary of the Interior’s (SOI’s) *Professional Qualification Standards* for Architectural History and History.

Marilyn Novell, M.S., was the lead author of this HRER. Novell has performed extensive historical services throughout California and has been with ASM since 2015. She meets the SOI’s *Professional Qualification Standards* as Architectural Historian and Historian. Prior to her work with ASM, Ms. Novell served as assistant project manager for the *LAUSD Historic Context and Comprehensive Survey*, which received preservation awards from the California Preservation Foundation and the L.A. Conservancy. She conducted background research, wrote summary reports, and surveyed 56 post-war LAUSD campuses. In addition to that wealth of experience working in educational settings, Ms. Novell has continued to work at LAUSD campuses while at ASM, for example evaluating Collins Street and Foshay schools, and conducting project-level reviews for proposed renovations to six LAUSD campuses in compliance with the Americans with Disabilities Act (ADA) to comport with the *Los Angeles Unified School District Design Guidelines*.

Shannon Davis, M.A., RPH, has more than 23 years of experience in the field of historic preservation, 10 of which have been spent in a senior role managing ASM’s historic preservation task orders, including multiple historic preservation on-call contracts. Ms. Davis has been working in educational settings, specifically at LAUSD schools, since 2011 when she prepared a HABS documentation package for Cienega Elementary School in the Culver City neighborhood. Since that time, Ms. Davis has completed multiple reports for schools, evaluating buildings on elementary, middle school, high school, and college campuses. Many of these projects were prepared for LAUSD schools through on-call contracts with LAUSD as both a prime and sub consultant.

1. INTRODUCTION

For this HRER, ASM conducted archival research regarding the Irving MS campus, including databases of historic newspapers, Los Angeles County Assessor's maps, Los Angeles Zoning Information and Map Access System (ZIMAS), Sanborn Fire Insurance maps, the Los Angeles Public Library, and historic aerial photographs. As-built architectural drawings and construction documents provided by the LAUSD Office of Environmental Health & Safety were reviewed prior to visiting the campus and were consulted in the process of this evaluation. A number of academic and professional sources were consulted (e.g., Pacific Coast Architecture Database and American Institute of Architects Historical Directory) for information about the architects and to determine their relevance and potential influence in the field of architecture. ASM was unable to access the LAUSD collection at the University of California, Los Angeles because it is currently closed to accommodate construction and maintenance.

This report is organized into the following sections: Executive Summary, Introduction, Campus Description and History, Neighborhood Context, Architects, Architectural Descriptions, Significance Evaluation, and Conclusion. California Department of Parks and Recreation (DPR) Series 523 forms as Appendix A, City of Los Angeles building permits as Appendix B, and architectural drawings as Appendix C.

Location

Located in the western portion of the Northeast Los Angeles Community Plan Area (CPA), Glassell Park is situated east of the Los Angeles River and west of Eagle Rock and Mount Washington. The area is traversed by San Fernando and Verdugo roads, which run north-south; and Eagle Rock Boulevard, Fletcher Drive, York Boulevard, and the Glendale Freeway (SR-2), which run generally east-west.

The Irving MS campus is located in the Glassell Park neighborhood, directly north of the Glendale Freeway (California State Route [SR-] 2), within the CPA. The commercial/light industrial corridor of North San Fernando Road is to the west, and the less intensively developed commercial/light industrial corridor of Fletcher Drive is to the northwest. Fletcher Drive Elementary School is directly across Estara Avenue from Irving MS to the northeast. Otherwise, the surrounding properties are residential, many constructed in the 1920s with newer infill, including large multi-family developments. The campus is bounded by Estara Avenue on the northeast, Marguerite Street on the southeast, West Avenue 32 on the southwest, and Fletcher Drive on the northwest (Figures 1-3).

Current Historic Resource Status

Irving MS was given a status code of 3S (recommended eligible for listing in the NRHP through survey evaluation) (Heumann 2002). ASM also reviewed the findings of historic resource surveys conducted through SurveyLA, a citywide, multi-year initiative of the City of Los Angeles Office of Historic Resources. The survey report for the Northeast Los Angeles CPA identified the school as a potentially eligible historic district with status codes of 3S, 3CS, and 5S3 (appears eligible for the NRHP, the CRHR, and locally through survey evaluation). Under Criteria A/1, the campus was described as “an excellent intact example of a post-Long Beach Earthquake middle school campus” that “embodies LAUSD school planning and design concepts of the period.” Under Criteria C/3, Irving MS was described as an excellent intact example of PWA Moderne architecture applied to a middle school campus, and an important example of the work of Los Angeles architect Edwin L. Bergstrom (HRG 2017).

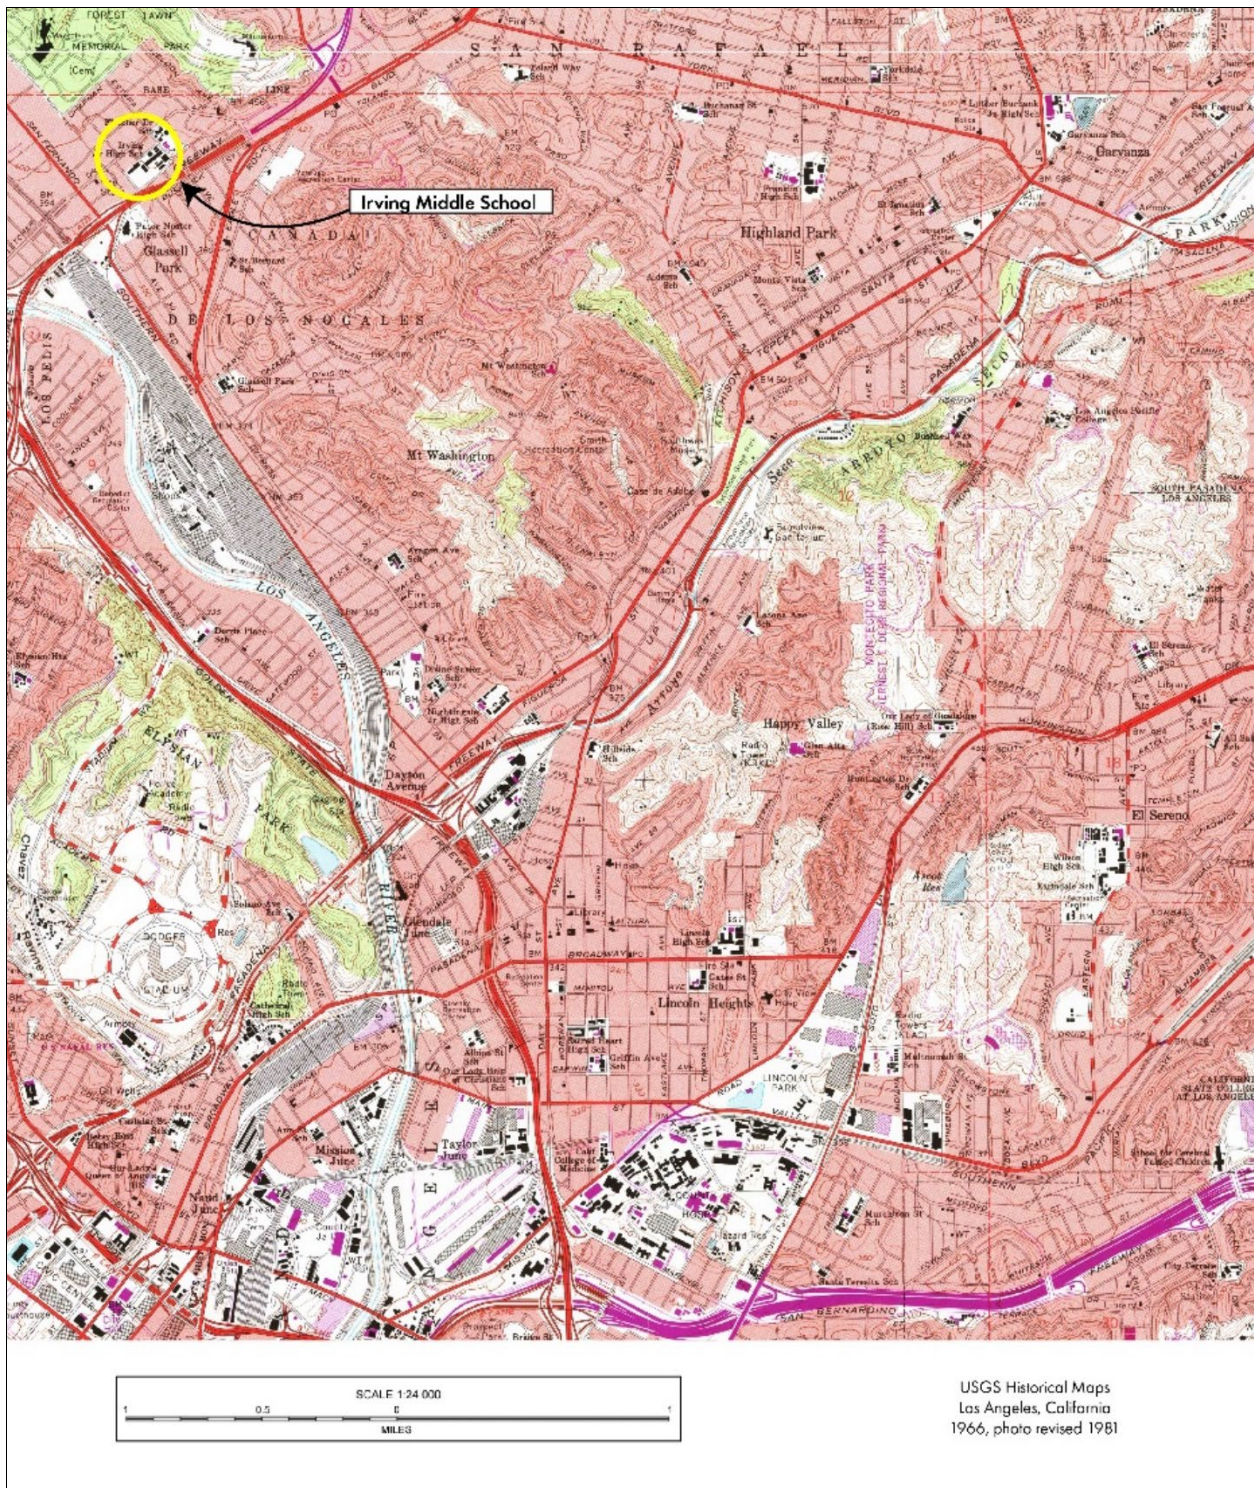

Figure 2. Project location map.

Figure 3. Irving Middle School campus map.

2. CAMPUS DESCRIPTION AND HISTORY

Site History and Construction Chronology

In 1889, Andrew Glassell built a Victorian home referred to as the “Ranch House” on an elevated site where Irving MS now stands (Figure 4). The Glassells owned acres of land surrounding the house and planted them with citrus orchards and a walnut grove at San Fernando Road near Fletcher Avenue (HRG 2012:14). A 1930 Sanborn Fire Insurance map (Vol. 40, Sheet 4013) shows Moss Avenue passing through between Marguerite Street and Fletcher Drive. A large dwelling is shown on the parcel, with a curved extension at the center of the northwest façade, and a wraparound porch on the southeast and southwest façades. Also on the parcel are a smaller dwelling, an automobile garage with a wing, and a third small building/structure. The area between the house’s parcel and Estara Avenue is filled with seven additional parcels (Figure 5 and 6). Sometime after 1930 and before 1951, a Sanborn map shows the original campus buildings on a larger parcel that subsumes all of the smaller parcels to the northeast along Estara Avenue, as well as those along W. Avenue 32 to the southwest. Moss Avenue has been vacated southwest of Roswell and incorporated into the campus. Extant buildings are the Administration building, the Auditorium, the Physical Education building (and Lunch Shed), the Cafeteria (labeled Restaurant), and two Shops. Buildings shown on the map that are no longer extant are three classroom buildings, a Tool House, and a Storage building.

The land that Irving MS occupies was subdivided in 1940 as Lot 1 of Tract No. 11428, which post-dates the establishment of the school. In historic aerial photographs, the campus is shown within Lot 1 of the tract. Whereas Roswell (alternatively Roswell) Street and Moss Avenue now terminate within the campus, the streets continued through the parcel until 1940, when the tract was subdivided (City of Los Angeles Ordinance No. 82252 and No. 77073, respectively; Figure 7). Changes in ownership of parcels that are currently part of the campus indicate how the school subsumed nearby properties over time.

In 1936, the City purchased the Glassell house through eminent domain to establish Irving MS (HRG 2012:36). In August 1936, on the recommendation of District manager and architect Alfred S. Nibecker, Jr., the Board approved several school projects, including funding for an Administration building, “assembly hall” (Auditorium), gymnasium (Physical Education building), cafeteria, and shops at the Verdugo Road District Junior High School. A contract of \$393,281 was awarded to Myers Brothers for the construction of the buildings, with Edwin L. Bergstrom as architect and Laurence J. Waller as structural engineer (*Los Angeles Times* 1936a). In November of that year, the *Los Angeles Times* noted the awarding of construction contracts totaling \$1,034,301 for four buildings at the school, omitting the assembly hall originally planned (*Los Angeles Times* 1936b). This news report and a notation on a Sanborn map stating the building was constructed in 1939 confirm that the Auditorium was added to the campus a few years later than the original buildings designed by Bergstrom. The following year, the addition of new buildings, including two temporary shop buildings, was scheduled at a cost of \$44,000, with Nibecker as architect (*Los Angeles Times* 1937).

A building permit for construction of the Administration building was issued by the Los Angeles Department of Building and Safety (LADBS) on October 23, 1936 (Permit No. 29559). The property was described as the Verdugo Road District Junior High School, referring to the name originally planned for the school. The architect was shown as Bergstrom, corresponding to information on the original architectural plans for the building on file at the LAUSD Vault. The two-story building was described as 64 by 391 feet in size, with 54 rooms (Appendix C: Vault drawing 8189.03, Cafeteria & Two-Unit Shop Buildings No. 1 and No. 2, A. S. Nibecker, Jr., architect, April 1937, Sheet No. 2). On the same date, a permit was issued for a Physical Education building, with Bergstrom as the architect and Laurence J. Waller as engineer. The two-story building was described as 53 by 151 feet in size (Permit No. 29558, October 23, 1936).

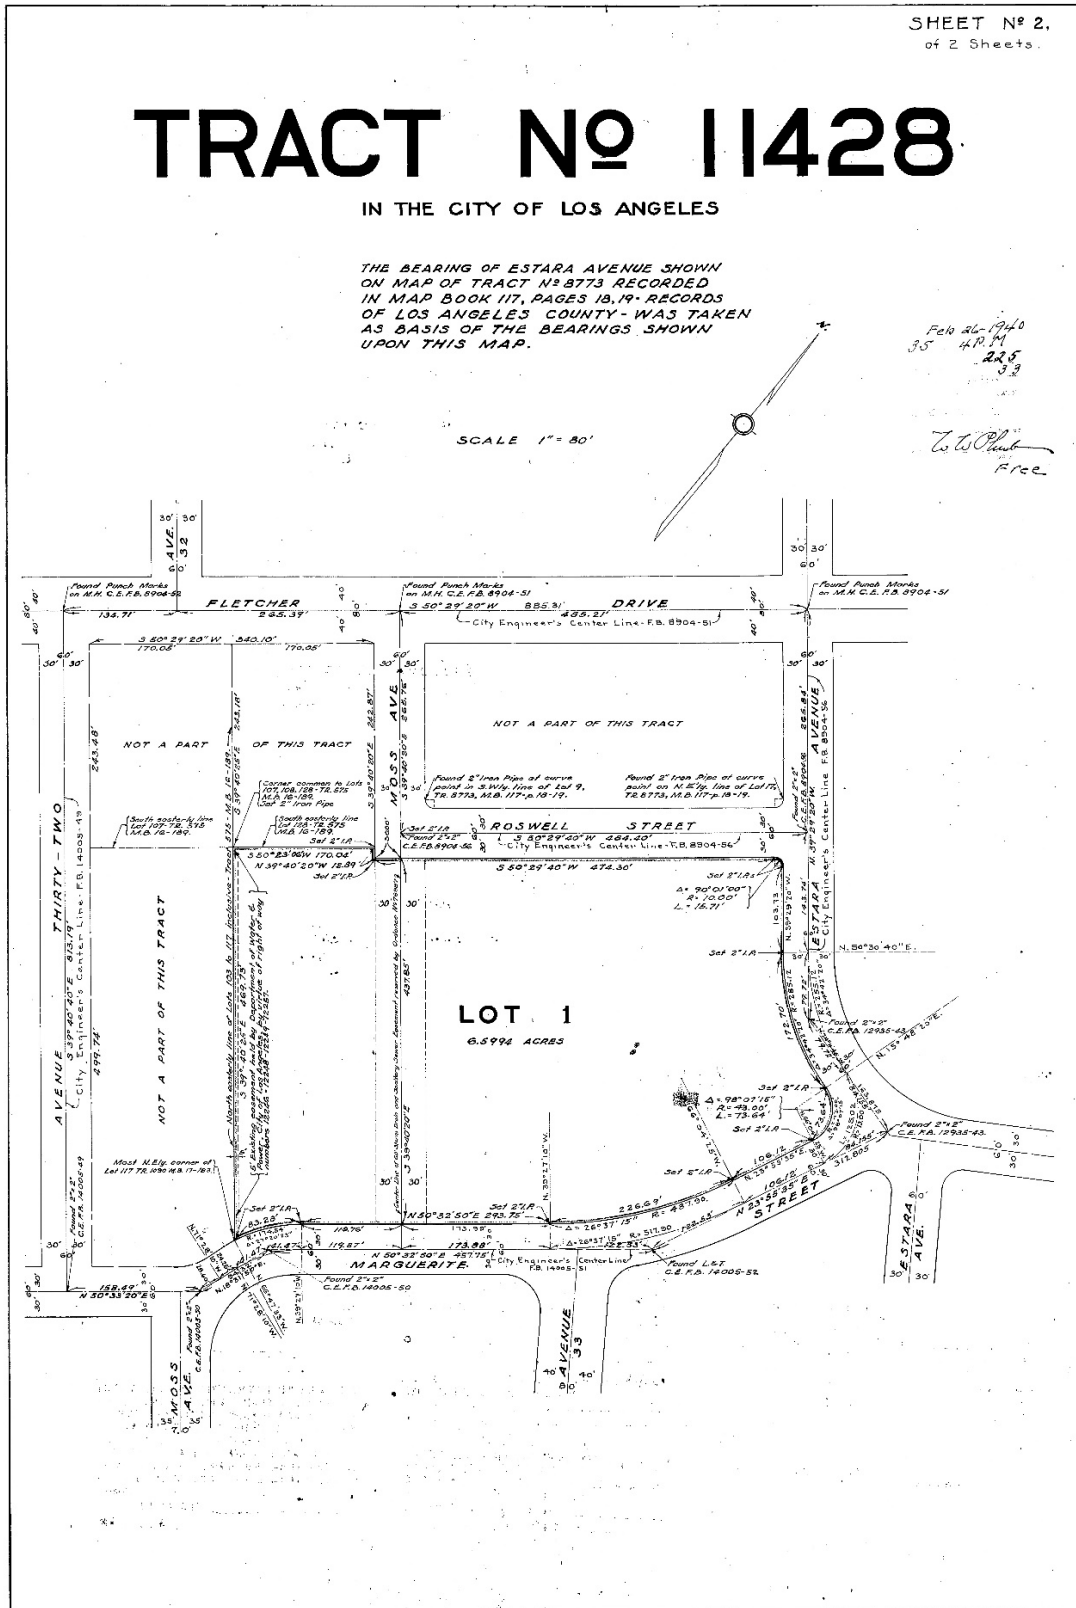

Figure 7. Tract map for Irving MS parcel, February 26, 1940.
Source: City of Los Angeles.

2. Campus Description and History

A permit for the Cafeteria was issued in 1937 (Permit No. 16027, May 13, 1937). The building is shown in architectural drawings as containing a Students' Dining Room, Faculty Dining Room (north corner), Serving Room, Kitchen, and Dishwashing Room (Appendix C: Vault, drawing 8189.03, Cafeteria & Two-Unit Shop Buildings No. 1 and No. 2, A. S. Nibecker, Jr., architect, April 1937, Sheet No. 2). Building permits for the Cafeteria and a temporary 40-by-60-foot single-story Temporary Shop Building (Shop No. 2) show Nibecker as the architect with J. E. Byers as engineer (Permit No. 16025, May 13, 1937).

Two rectangular shop buildings were constructed southwest of the Cafeteria. The two shops are shown in architectural drawings as identical on the exterior, with the exception of an additional small window centered between the two doors at each of the northwest and southeast façades of Shop No. 2. The interior of Shop No. 1 originally was intended to house a print shop and a metal shop, side by side, each with separate entrances. The interior of Shop No. 2 was designed for side-by-side electric and wood shops, with the wood shop occupying slightly more space. A third shop building was designed by Bergstrom, along with the other original buildings on campus. The design showed a larger shop with exterior design elements echoing the other buildings and with metal, electric, and woodworking shops under the same roof. It appears this building was not constructed but was replaced by the two extant shops (Shop No. 1 and Shop No. 2), which were designed a year later (Vault drawing 8189.03, Cafeteria & Two-Unit Shop Buildings No. 1 and No. 2, A. S. Nibecker, Jr., architect, April 1937, Sheet No. 1).

Although the Auditorium was designed by Bergstrom, along with the Administration and the Physical Education buildings in 1936, it appears to have been constructed later, in 1939. A story in the *Eagle Rock Advertiser* announced dedication ceremonies on June 12, 1942, noting that the Auditorium was completed in 1939; it was named in honor of the retiring principal, Mrs. Helen Watson Pierce (*Eagle Rock Advertiser* 1942). The 1939 construction date is confirmed by a building permit for new construction issued for the building in November 1938 (Permit No. 40026, November 28, 1938). Furthermore, a PWA plaque near the entrance to the Auditorium is dated 1939 (see Figure 30). Another plaque notes the dedication took place for the Helen Watson Pierce Auditorium on June 12, 1942 (see Figure 31).

Originally called the Verdugo Road District Junior High School, the name was changed to Washington Irving Junior High School when it opened in 1937. Six buildings comprised the original campus group: Administration, Auditorium, Physical Education, Cafeteria, and two Shops. The first three were designed by Edwin L. Bergstrom in 1936 (Appendix C: Vault drawings 8189.04, August 1936). The Cafeteria, in addition to two Shops, were designed a year later by Board of Education architectural manager Alfred S. Nibecker, Jr. (Appendix C; Vault drawing 8189.03, Cafeteria & Two-Unit Shop Buildings No. 1 and No. 2, April 1937, Sheet no. 2). The Auditorium, designed by Bergstrom in 1936, appears to have been constructed in 1939. With the exception of the Shops, the buildings exhibit character-defining features associated with PWA Moderne architecture, with elements of Streamline Moderne style.

The area near Fletcher Drive and Estara Avenue was occupied by single-family residential properties until sometime between 1980 and 1994. Residential properties were cleared on Roswell Street between 1980 and 1994 (historicaerials.com 1948, 1952, 1964, 1972, 1977, 1980, 1994). The parcel at the corner of Fletcher Drive and Estara Avenue, now a part of the campus, changed ownership in 1991. Its previous use was as a one-story store constructed in 1929 by owner W. M. Glassell, with Arthur C. Munson as architect (William Glassell was the brother of founder of Glassell Park, Andrew Glassell; Munson was responsible for several houses in southern California, as well as the Long Beach Theatre in 1920 [PCAD 2021a]). The building filled the 62.5-by-60-foot parcel (Permit No. 4852, February 25, 1929). A permit for construction of an awning at the address listed the owner as Safeway Stores, Inc. (Permit No. 12714, May 10, 1929), suggesting the store was a franchise of the Safeway chain of groceries. Other parcels along Fletcher Drive that are now part of the campus were previously multi- and single-family residential, with the last ownership changes in 1987 or 1988 (Los Angeles County Office of the Assessor). Properties south of Moss Avenue, which currently terminates within the campus, included a lumberyard and parking lot, with last ownership changes in 1967 (Assessor).

3. NEIGHBORHOOD CONTEXT

Brief History of Glassell Park

In 1784, three years after the nearby El Pueblo de Los Angeles was founded, Spanish Governor Pedro Fages granted all the lands between the Los Angeles River and the Arroyo Seco to Jose Maria Verdugo.¹ Rancho San Rafael, as it was known, covered approximately 36,000 acres. In 1848, the validity of the Verdugo claim to Rancho San Rafael was upheld by United States courts. By 1869, however, the Verdugo family was in debt and Rancho San Rafael was in foreclosure. Attorney Alfred Beck Chapman and his partner, Andrew Glassell, purchased the property. They subdivided the land into 31 parcels, leaving the Verdugos 3,500 of the original 36,000 acres. Although land within the CPA was primarily used for agricultural purposes throughout the middle decades of the nineteenth century, it was early subdivision efforts of rancho and pueblo land that sparked the process of differentiation and development that ultimately produced the distinct communities of northeast Los Angeles. Present-day communities that were initially subdivided from land within the boundary of the Rancho San Rafael include Atwater Village, Garvanza, Glassell Park, Highland Park, Mount Washington, and Eagle Rock.

Both Chapman and Glassell were partners in a law firm with Colonel George H. Smith, where their practice was largely confined to real estate transactions and lawsuits regarding partitions of land. Chapman and Glassell often took their compensation in land, which afforded them a substantial amount of acreage to develop or resell as they saw fit. (Glassell and his brother, William, founded the City of Orange in this manner.) As a result, Glassell and Chapman were well-positioned to develop the Glassell Park area for further subdivision. Following Glassell's death in 1901, his heirs began selling off portions of the family's rancho lands to the Gilchrist Investment Company. This company first began to develop Glassell Park around 1909, when the *Los Angeles Times* announced the company's construction of 11 five- and six-room "attractive modern" bungalows, "each one a model of individuality and design." The report continued, "Glassell Park is one of the beautiful tracts in this vicinity. Each bungalow being built commands a super view, revealing a vista of verdant valley and rolling hills back of which towers the majestic range of the Sierra Madres with their caps of snow" (*Los Angeles Times* 1909).

Meanwhile, development was already under way by 1906, when the Torthorwald Tract was announced as the "finest subdivision ever placed before the homeseeker in the vicinity of Los Angeles" (*Los Angeles Herald* 1906). A display ad described Glassell Park as "more beautiful than Hollywood." The developers offered excursions to view the parcels on their own special cars from the Salt Lake railway depot [near East First Street east of the Los Angeles River] (*Los Angeles Herald* 1906) (Figure 8). Another ad for the tract described it as "situated 4.5 miles from the courthouse, on a beautiful plateau amidst the foothills at the junction of the San Fernando & Verdugo roads." A selling point was the new Los Angeles Railway car line to Eagle Rock running through the tract (*Los Angeles Times* 1906).

In January 1912, the Gilchrist Investment Company sold Glassell Park to National Home and Town Builders. Announcement of the sale noted Glassell Park's attractive amenities—such as its proximity to the new site of Occidental College and "a magnificent view of Mts. Lowe and Wilson and the surrounding country"—and noted that street work in the tract had been completed with sidewalks, curbing, and water lines already installed (*Los Angeles Times* 1912). In February 1912, the majority of Glassell Park was annexed to the City of Los Angeles as part of the Arroyo Seco Addition; the remainder was later annexed in 1916. Development continued through the 1920s and into the 1930s as the Glassell family continued to subdivide their land; residential development in particular was spurred by the 1923 opening of the nearby

¹ Discussion of the early history of the CPA has been excerpted and adapted from *Historic Context Statement: The Northeast Los Angeles Subregional Planning Area of the City of Los Angeles*, prepared by Historic Resources Group, revised July 9, 1990 (unless otherwise cited); in HRG 2017:16-17.

Source: *Los Angeles Herald*, February 23, 1906.

Glassell Park's built environment largely reflects its development in the early twentieth century, with examples of later infill and new construction throughout the neighborhood. The neighborhood is developed primarily with single-family residences, predominantly in the Craftsman architectural style, along with a lesser number of multi-family residences from the same period (Figure 9). Commercial development is concentrated along the area's major automobile corridors, including San Fernando Road, Verdugo Road, Eagle Rock Boulevard, Fletcher Drive, and York Boulevard.

The 1933 Long Beach Earthquake and the Public Works Administration

After the devastating 1933 Long Beach Earthquake, both the State and the City of Los Angeles developed structural guidelines that mandated safety requirements for new schools. The Field Act (Field Bill) of 1933 directed the State Division of Architecture to develop regulations to ensure earthquake-resistant schools. The City also revised its City Building Ordinance and adopted additional requirements for school construction. The required construction improvements were implemented in schools such as Irving MS constructed after 1927. Requirements included fire resistant corridors, stairs, and exterior walls; and reinforced concrete in floors and roofs (Heumann 2002:9-10). The District planned for phased reconstruction of schools after the earthquake. Available at the time were a total of \$5.3 million in unsold bonds. The PWA purchased the bonds and granted additional matching funds for school reconstruction efforts. A total of \$12.1 million was ultimately raised for the 1933 to 1935 reconstruction program. The district-wide school reconstruction program included reinforcing or replacing 132 unreinforced masonry buildings, strengthening 275 buildings constructed since 1927, replacing 51 wood-frame buildings, and elimi-

3. Neighborhood Context

nating all temporary classroom housing. By 1937, more than \$34 million had been spent on post-Earthquake school construction, repairs, retrofitting, and rehabilitation (Sapphos 2014:64).

Created by the National Industrial Recovery Act, the PWA was founded within a few months of the March 1933 Long Beach Earthquake. In response to widespread damage to Los Angeles public schools caused by the earthquake, the PWA funded school reconstruction work. Consequently, a substantial number of Los Angeles public schools either built or remodeled during this time exhibit some degree of PWA Moderne styling. Also referred to as “Stripped Classicism,” the PWA Moderne often incorporates elements of a number of styles. Compared with Streamline Moderne, PWA Moderne was more formal and symmetrical in its overall design, with less emphasis on curvilinear shapes and horizontality (Sapphos 2014:124).

As reconstruction began, the District intended to build new seismically sound buildings but also to include regionally influenced styles. As the *Los Angeles Times* reported in 1934, new and repaired buildings would be designed for “absolute safety with simplicity and beauty of architecture in harmony with the atmosphere and traditions of Southern California.” Many designs were executed by the district’s architectural department, under the direction of Nibecker, but outside architects were also invited to bid, with the intention of awarding the work to a wide field of architects. In addition, new buildings were to be explicitly southern Californian in design but “free of needless ornamentation” (*Los Angeles Times* 1934). This represented a move away from 1920s period-revival styles but also a nod to earthquake safety, because applied ornamentation often fell off during earthquakes (Sapphos 2014:64-65).

4. ARCHITECTS

Edwin L. Bergstrom. The architect responsible for the three earliest major buildings on the Irving MS campus was Edwin L. Bergstrom, who partnered with John Parkinson to “help define the look of pre-World War II Los Angeles” (Los Angeles Conservancy 2021). Among Bergstrom’s numerous noteworthy projects are the City of Pasadena Civic Auditorium (1925-1932), Los Angeles County General Hospital (1933, as a member of the firm of Allied Architects Association), the Rosslyn Hotel (1914), and the U.S. Government Department of Defense Pentagon (1941-1943, as Bergstrom and Witner). He did coursework at Yale University, Sheffield Scientific School, in New Haven, Connecticut, ca. 1896-1897. Bergstrom spent only one year at Yale before transferring to Massachusetts Institute of Technology (MIT), which he attended in 1897-1899, receiving a bachelor of science in Architecture (PCAD 2021b). Bergstrom is included in the *LAUSD Historic Context Statement* in a list of prominent architects who were responsible for extant buildings throughout the District (Sapphos 2014:132).

Alfred S. Nibecker, Jr. District architect and business manager Alfred S. Nibecker, Jr., signed the 1937 architectural drawings for the Cafeteria and Shops. Nibecker guided the Los Angeles school district through rapid expansion in the 1920s, disaster and depression during the 1930s, and the great postwar boom through the mid-1950s. In the 1920s, Nibecker began private practice in Los Angeles; he joined the Los Angeles City Board of Education as an architect in 1926, where he remained until his retirement in 1955. In his three-decade career with the school district, Nibecker oversaw the construction of, and contributed designs to, hundreds of school plant projects. Many commissions were completed by the district’s in-house staff, but many others were handled by a range of the region’s best architects and builders, with an increasing number of firms specializing in school design. In addition to his work with the Los Angeles City school district, Nibecker was a fellow of the American Institute of Architects and served on the National Committee on School House Construction, the National Advisory Council on School Building Problems, run under the auspices of the U.S. Department of the Interior, Office of Education. In 1955, Nibecker was made an honorary member of the Structural Engineers Association of Southern California, the association’s highest award (Sapphos 2014:42).

5. ARCHITECTURAL DESCRIPTIONS

On June 24, 2021, ASM conducted an on-site survey of the campus to document it with detailed field notes and photographs of the exteriors and interiors (where available) of the original buildings at Irving MS constructed in the 1930s (Figure 10). A playing field at the corner of Fletcher Drive and Estara Avenue, paved recreation areas, and storage containers occupy the rectangular area formed by Moss Avenue and the former Rosswell Street, both of which have been incorporated into the campus property. A second playing field is at the south end of the campus at the corner of West Avenue 32 and Marguerite Street. In addition to the original buildings are several shops and classroom buildings at the west side of campus and a complex of new classroom buildings off Marguerite Street on the southeast side of campus, south-east of the Administration building and between the Auditorium and the Physical Education building.

Although major elements of the exteriors of the buildings are vertically oriented, the composition of the façades also emphasizes horizontality, a characteristic identified in the *LAUSD Historic Context Statement* as associated with Streamline Moderne/Moderne architecture. Of the four major original buildings, three (Administration, Auditorium, and Physical Education) were designed by Bergstrom; the drawings for the Cafeteria and Shops are signed by district manager Nibecker. All of the original buildings are constructed of reinforced cast concrete. In the case of the Bergstrom-designed buildings, the exterior walls display a prominent horizontal board-form texture, and heavy fluted cast plaster pilasters flank entrances and are highlighted by a paint palette of royal blue contrasting with stark white exterior walls. All of the major buildings have flat parapets and horizontal stringcourses encircling the exteriors a few feet below the parapet and stringcourses above and below the windows, creating a horizontal look in contrast with the verticality of the pilasters.

Appendix C provides elevations and plans for the buildings. Note that directional indications on the drawings are inconsistent, likely as a result of the orientation of the buildings as 45 degrees off cardinal directions. For the purposes of this report, the more accurate orientations of northwest, southwest, etc., are used.

Administration

Exterior

The northeast façade of the Administration building is parallel to Estara Avenue. A wide walkway passes southeast of the building between the Administration building and the Auditorium, creating a formal entrance to campus through a wide metal gate. The Administration building is constructed of concrete with a flat parapet and an elongated rectangular plan. The two-story building has a partial basement at the northeast end. The configuration of the design elements is generally symmetrical. A narrow band at the top of the parapet encircles the building, broken by full-height fluted plaster pilasters framing the entrances and a two-story central section constructed of glass blocks. The pilasters rise slightly above the parapet, with a horizontal band of “cresting” at the top and dentil molding between the pilasters above the second-floor windows. Centered between these two horizontal elements is a gold-painted plaster medallion, consisting of a simple circle above the secondary entrances and a more-ornate design of an owl above an open book at the primary entrance on the southeast façade and at a secondary entrance centered on the southwest façade. Above each entrance is a flat rectangular cantilevered metal canopy with horizontal bands. Each secondary entrance has a vertically oriented window marking the location of an internal stairway. These windows are multi-light wood sash, with some inoperable fixed panes. The secondary entrances are composed of nonoriginal sets of double metal doors, most with multi-light transoms above (Figures 11–14).

Figure 10. The core of Irving Middle School campus showing buildings surveyed.

Figure 11. Southeast façade of the Administration building.
Shows horizontal stringcourses and configuration of secondary entrances, with flat canopy, vertically oriented window, and plaster medallion.

Figure 12. Secondary entrance at southeast façade, showing horizontal board-formed concrete texture on exterior walls.

Figure 13. Detail of plaster medallion in form of an open book with owl above on the southwest façade, view toward the northeast.

Figure 14. Southwest and southeast façades of the Administration building, view toward the north.

5. Architectural Descriptions

The majority of the windows are the same throughout on both levels, consisting of recessed wood two-by-two over two-by-two sash set in channels between horizontal dentil molding at the top and a simple continuous stringcourse at the bottom. The windows are evenly spaced in groups of four, separated by wide fluted sections (Figures 15 and 16).

The primary entrance is centered in a section of the southeast façade that projects away from the main wall of the building. Between the full-height pilasters are two wood sash windows at the second floor and a wide flat canopy directly above the recessed entrance. Above the canopy, the name of the school is shown in cut-out metal letters. On the projecting section, the windows at the second floor have two-light transoms above. The sides of the section have no fenestration except a concrete grille over a secondary window at the first floor resembling those flanking the entrance to the Auditorium (Figure 17).

Centered on the shorter façades of the building are two-level central sections of glass blocks, admitting light to the interior corridors. The northeast façade has no other fenestration except a small utility door and small windows below grade (Figures 18 and 19).

Figure 15. Northwest façade, view toward the south.

Figure 16. Center of the northwest façade, view toward the south.

Figure 17. Primary entrance of Administration building.
*Shows plaster medallion, fluted pilasters, and flat canopy.
Cut-out metal lettering on canopy identifies building.*

Figure 18. Southwest façade of the Administration building, view toward the northeast.

Figure 19. Northeast façade, showing vertical fluted pilasters and multi-story glass-block section.

Interior

The interior consists of a double-loaded central corridor at each floor that runs the length of the building. The section of glass blocks that extends from the ground level across both floors passes through the second-level floor plane and provides natural light at both ends of the corridors on both levels (Figure 19, above, and Figure 20). The glass blocks flanking the entry at the center of the northwest façade allow light into the interior of the ground floor at the bottom of a stairwell (Figure 21). The corridors have dropped ceilings of acoustical tile with inset fluorescent lighting and vinyl tile flooring. The doors are metal, each with a single vertically oriented light and lever-type hardware (Figure 22). Some doors have multi-light transoms that have been painted over (Figures 23 and 24). Corners in the corridors are rounded (Figures 25 and 26). A few original wood display cases with decorative molding and glass insets remain on the first floor (Figure 27). In the classrooms and offices, the ceilings are acoustical tile with attached rectangular fluorescent lighting. In the interior, windows and doors have wood molding surrounds. A few original paneled wood doors with brass hardware remain in the offices (Figure 28).

Auditorium

Exterior

The primary (northwest) façade of the Auditorium is situated southeast of the Administration building and the wide path forming the entrance to campus. A metal gate spans the space between the two buildings and bears cut-out lettering identifying the campus. Similar to the Administration building, the two-story Auditorium is constructed of concrete with a flat parapet and a generally rectangular plan. The plan steps back slightly on the northeast and southwest façades toward the southeast end, marking the location of the stage. Like the Administration building, the exterior walls clearly show the texture of the horizontal board forms used to construct the building.

The configuration of the design elements of the Auditorium is generally symmetrical on each façade. A narrow band of cresting at the top of the parapet encircles the building, with a stringcourse in a dentil motif approximately 6 feet below. Lower sections span the width of the building at the northwest and southeast façades.

The primary (northwest) façade is composed of three sets of paneled wood doors positioned below a wide expanse of unfenestrated wall. The three entrances are each flanked by two fluted plaster pilasters that span the height from ground level to the bottom of the dentil stringcourse above (Figures 29 and 30). A narrow stringcourse runs across the tops of the doors between the two sets of pilasters. Above the doors the building is identified by cut-out bronze letters in a serif font attached to the exterior wall. At each side of the entrance wing is a secondary window with a concrete grille, a motif also seen flanking the primary entrance on the Administration building (Figure 31). Attached to the exterior wall between the doors are two plaques. One plaque indicates the building was a 1939 project of the New Deal Administration of Public Works (more commonly known as the Public Works Administration or PWA) (Figure 32). A second plaque records the dedication of the Auditorium to retiring principal Helen Watson Pierce on June 12, 1942 (*Eagle Rock Advertiser* 1942) (Figure 33).

The northeast and southwest façades are nearly identical. A higher section is centered on each façade, marking the location of the assembly hall inside. The prominent feature of each of these façades is a set of three multi-light windows, separated by fluted pilasters, centered on the projecting central section. A stringcourse with a dentil motif runs across the tops of the windows, and the cresting motif is continued at the top of the parapet on this façade. The wood windows each have two separate sections: a three-by-two-light section at the top and a three-by-five-light section at the bottom (Figures 34 and 35). Accommodating the topography, the shorter section at the southeast end of the building follows the natural slope and has a multi-light wood window on each façade at the lower level, marking the location of the band room.

*Shows crested stringcourse at top of parapet, dentil stringcourse above windows,
and multi-light wood windows, view toward the southwest.*

Figure 35. Southwest façade of Auditorium.
Shows window configurations identical to northeast façade.

There is also a double wood entrance door to the band room at the southwest façade (Figure 36). At each of these façades, unfenestrated sections of the wall step inward toward the southeast (Figure 37).

Figure 36. Entrance on the southwest façade at lower level, view toward the northeast.

Figure 37. Detail of southeast end of southwest façade of Auditorium, view looking up at stepped wall.

At the southeast façade, the main part of the wall is unfenestrated, with the stringcourse and cresting at the parapet continuing around the building. At each end of the façade, two wide fluted sections span the distance from the stringcourse to the top of the lower level. At the lower level, a series of six recessed multi-light windows, flanked by smaller windows at each end, mark the location of the band room (Figure 38).

Figure 38. Southeast and northeast façades of the Auditorium, view toward the west.

Interior

The Auditorium building is entered through a full-width foyer, featuring a terrazzo mural on the opposite wall. The mural, titled “Life of Washington Irving,” depicts the author for whom the school is named. It shows the author amid pictorial references to his literary works, including “The Legend of Sleepy Hollow” and “Rip Van Winkle.” A small plaque indicates the mural was a project of the Federal Emergency Works Progress Administration (WPA) under President Franklin D. Roosevelt (Figure 39). On each side of the mural is a set of double paneled wood doors providing access to the assembly hall; two additional sets of doors are located to the left and right of the foyer. In the foyer, the design elements are curvilinear, in contrast with the more angular exterior elements, including a ticket booth recessed into a curved wall on the northwest side of the foyer (Figure 40). The ceiling displays a multi-level stepped configuration that follows the form of the curved walls. Lighting is provided by four round aluminum chandeliers with horizontal bands, which are suspended from the ceiling by fixed rods (Figure 41). The floor is covered in vinyl tile.

The assembly hall reflects a traditional plan of a stage at the far end (back of the house), recessed between rounded walls that narrow down to the width of the stage. The ceiling steps down gradually to the top of the stage. The stage is approached by two side aisles lined with seating fixed to a raked floor (Figures 42 and 43). The molded plywood foldable seats are connected, with cast-iron ends in a Moderne motif (Figure 44). The ceiling is marked by slightly recessed parallel stepped bands that trace the edges of the room (Figure 45). Round metal chandeliers are suspended from the ceiling with fixed metal rods connected to a canopy with a Moderne motif. The pendants have a circular form with metal elements radiating from the center (Figure 46).

Figure 39. Terrazzo mural in lobby of Auditorium depicting Washington Irving and his literary works.

Figure 43. View of assembly hall from stage, looking southeast.

Figure 44. Detail of cast-iron and molded plywood foldable seating in Auditorium.

Figure 45. Interior view of windows at northeast façade of Auditorium.

Figure 46. Detail of chandelier in Auditorium.

A short wood staircase with curved wood bases at each side of the stage parallels the walls (Figure 47). The stage and backstage area have wood flooring. Paneled wood doors are located throughout the backstage area. Wings to the southeast and northwest of the backstage area house storage, toilets, and dressing rooms (Figures 48 and 49).

Figure 47. Detail of stairs and articulated wood base.

Figure 48. Wood flooring on stage and backstage area and two-panel wood doors.

Figure 49. Original paneled wood door and brass hardware.

5. Architectural Descriptions

Below the stage is a band room. Concrete beams are visible on the ceiling. Acoustical tile lines the areas between the beams on the ceilings and on the walls. Lighting is provided by dropped fluorescent fixtures. Paneled wood storage cabinets line the southeastern wall. As the band room is located on the natural downslope from the auditorium entrance, there are windows and an exterior door. Windows are recessed wood sash, with three-over-three horizontal lights. Doors in this area are original paneled wood with two horizontal lights and vertical light transoms. The walls are lined with continuous green chalkboard, and the floor is carpeted (50 and 51).

Figure 50. Band room beneath stage, view toward the north.

Figure 51. Band room, view toward the east.

Physical Education

Exterior

The two-story Physical Education building is located southwest of the Administration building, adjacent to the south playing field. The building repeats the design elements of the Administration and Auditorium buildings, with textured board-form poured concrete on the exterior walls. The parapet is capped with a plain stringcourse, and a stringcourse of dentil molding parallels the roof approximately seven feet below. An elevator wing has been added to the southwest façade facing the playing field. The building has a rectangular plan and sits on a concrete foundation. The plan is generally symmetrical, with areas for boys and girls at separate ends.

Centered on the northeast (primary) façade is a group of five identical windows consisting of pairs of two-by-three-light awning-type windows. Between the windows are wide fluted pilasters spanning the distance between the bottoms of the windows and the top of the parapet. The dentil molding around the building is broken by these pilasters and continues along the tops of the windows. A plaster medallion is located above the center window. Centered below the group on the northeast façade is cut-out bronze lettering identifying the building. All other windows on the second floor are groups of small four-over-four sash, recessed in channels (Figure 52).

Figure 52. Detail of cut-out letters and awning-type windows at northeast façade of Physical Education Building.

The southwest façade is similar to the northeast façade. Whereas the façade originally had five pairs of two-by-two-light awning-type windows, a projecting elevator shaft has replaced the original central window on the façade. The small elevator wing has a rectangular plan and a flat roof. The height sits below the dentil stringcourse on the main section of the building. The elevator wing has a narrow stringcourse that does not align with that of the main building and irregular fenestration (Figure 53). Like the northeast façade, the other windows on the second floor are groups of small four-over-four sash, recessed in channels and placed symmetrically on both sides of the central window group. Fenestration at the ground level of the southwest façade is irregular in size and type of windows and doors. The door at the southeast end of the façade has a multi-light transom.

There is a recessed entrance with a multi-light transom at each of the northwest and southeast façades. A secondary entrance with a multi-light hopper-type transom is on the southeast façade. Fenestration on the ground level is irregular. All windows are recessed multi-light wood; on the northeast and southwest façades, several windows are grouped in pairs. The second floor displays the majority of the stylistic elements of the building. Centered on each of the northwest and southeast façades is a group of identical windows consisting of pairs of two-by-two-light awning-type windows (Figures 54 and 55).

Figure 53. Window configurations at southwest façade mirror those at primary façade.

Figure 54. Physical Education Building, southeast façade. Shows dentil molding below parapet and arrangement of windows.

Figure 55. Window configurations at northeast (primary) façade of Physical Education Building.

Interior

The interior of the first floor contains showers, dressing/locker rooms, toilets, and offices (Figures 56 and 57). The plan generally is mirrored on each end of the building, with the areas for boys echoing those for girls. There is a two-flight staircase at each of the northwest and southeast façades. The stairs are cast concrete. On the first floor, the wall curves outward and the steps follow the curve at the bottom. A vertically oriented multi-light window is located in each stairwell. The stairs are adjacent to a corridor leading to the entrance, which also has a curved wall (Figures 58 and 59).

The second-floor plan has an exercise room/gymnasium at the center, with equipment and exercise rooms at each end, separated into a girls' section and a boys' section. Doors from each provide access to the gymnasium. The ceiling of the gymnasium is covered in acoustical tile, and lighting consists of attached fluorescent fixtures. The floors are parquet wood. Five large three-part windows are located on each exterior wall. Each section is a two-by-two-light awning-type window (Figures 60 and 61).

Figure 56. Interior of locker room on first floor, view toward the southeast.

5. Architectural Descriptions

Figure 60. Parquet wood floor and awning-type windows in gymnasium of Physical Education Building.

Figure 61. Parquet wood floor and awning-type windows in gymnasium of Physical Education building.

Cafeteria

Exterior

The single-story Cafeteria is centered on the Administration building to the northwest. The setting consists of paved parking areas, patios, and mature trees. A driveway that was once Rosswell Street runs parallel to the northwest façade of the building. Similar to the other major buildings in the campus core, the building has a flat parapet capped with metal coping and a prominent stringcourse with horizontal bands a few feet below. This building is clad in smooth stucco. It echoes the design elements of the other original buildings in its use of fluted pilasters between groups of windows. It has a generally rectangular plan, with a small wing extending from the southeast façade and an entry vestibule extending from the southwest façade. Both of these wings have overhanging flat roofs and fascia with horizontal bands. This motif is carried through in a projecting element running across the tops of windows and doors. Cut-out bronze letters identifying the building are attached to the northwest façade. Overflow scuppers are located above square catchment boxes (labeled “Catchment Heads” on architectural drawings), with horizontal bands capping round downspouts. Small round vents are located below the stringcourse. Vertically oriented multi-light windows paired in groups of two or three with fluted divisions that are partially operable (Figures 62-64).

Figure 62. Stringcourse, canopies, and sunshades with horizontal details on Cafeteria.

Figure 63. Lettering identifying building, round vent, and square catchment below scupper on Cafeteria.

Figure 64. Windows on Cafeteria building.
Shows two-light section above two-by-four-light section, with fluted plaster piers separating window pairs.

Interior

The interior is dominated by a large room that fills more than half of the southwest end of the building. In original plans, it is labeled Students' Dining Room. A partition is centered on the northeast wall of the large dining room, behind which are areas labeled a Serving Room, a Kitchen, a Faculty Dining Room, and a Dishwashing Room, as well as several small storage and service rooms. There are several original two-panel wood doors with brass hardware. A Moderne-style water station is also located in the Faculty Dining Room, which also has a non-original exterior door with an original two-light transom (Figures 65 and 66). There are two skylights in the building, one in the large dining room, and a smaller one in the serving/kitchen area (Figure 67).

Figure 65. Moderne water station in faculty dining room in Cafeteria.

Figure 66. Two-light transom and Moderne-style water station in Faculty Dining Room in Cafeteria.

Figure 67. One of two multi-light skylights in Cafeteria.

Shops

Two small shops with rectangular plans and of nearly identical size are located northwest of the south playing field. Shop No. 1 is southwest of Shop No. 2. The façades of the two shops are similar, the only apparent difference being variations in size and placement of windows and doors. A covered flat-roofed canopy with a wood ceiling and supported by tubular steel columns and railing runs along the southeast façades, connecting the two shops and continuing to connect to utilitarian buildings farther to the southwest. The shops have flat parapets capped with metal coping. At the southeast façades, partially obscured by the corridor roof are six-by-five-light windows, which appear to be partially operable. The northwest façades are configured the same as the southeast façades, each with three pairs of multi-light windows. The northeast and southwest façades are irregularly fenestrated (Figures 68–75).

6. SIGNIFICANCE EVALUATION

Evaluation Framework

National Register of Historic Places

Authorized by the NHPA of 1966, the National Park Service's NRHP is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect America's historic and archeological resources. The NRHP is the official list of the nation's historic places worthy of preservation. The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity and:

- A. are associated with events that have made a significant contribution to the broad patterns of our history; or
- B. are associated with the lives of persons significant in our past; or
- C. embody distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or have yielded, or
- D. may be likely to yield, information important in prehistory or history.

Integrity

In order to be eligible for listing in the NRHP and CRHR, a property must retain sufficient integrity to convey its significance. The NRHP publication *How to Apply the National Register Criteria for Evaluation*, National Register Bulletin 15, establishes how to evaluate the integrity of a property: "Integrity is the ability of a property to convey its significance" (National Park Service 1997). The evaluation of integrity must be grounded in an understanding of a property's physical features and how they relate to the concept of integrity. Determining which of these aspects are most important to a property requires knowing why, where, and when a property is significant. To retain historic integrity, a property must possess several, and usually most, aspects of integrity:

1. *Location* is the place where the historic property was constructed or the place where the historic event occurred.
2. *Design* is the combination of elements that create the form, plan, space, structure, and style of a property.
3. *Setting* is the physical environment of a historic property, and refers to the character of the site and the relationship to surrounding features and open space. Setting often refers to the basic physical conditions under which a property was built and the functions it was intended to serve. These features can be either natural or manmade, including vegetation, paths, fences, and relationships between other features or open space.
4. *Materials* are the physical elements that were combined or deposited during a particular period or time, and in a particular pattern or configuration to form a historic property.
5. *Workmanship* is the physical evidence of crafts of a particular culture or people during any given period of history or prehistory, and can be applied to the property as a whole, or to individual components.
6. *Feeling* is a property's expression of the aesthetic or historic sense of a particular period of time. It results from the presence of physical features that, when taken together, convey the property's historic character.

7. *Association* is the direct link between an important historic event or person and a historic property.

California Register of Historical Resources

The CRHR program encourages public recognition and protection of resources of architectural, historical, archaeological, and cultural significance; identifies historical resources for state and local planning purposes; determines eligibility for state historic preservation grant funding; and affords certain protections under CEQA. The criteria established for eligibility for the CRHR are directly comparable to the national criteria established for the NRHP.

In order to be eligible for listing in the CRHR, a building, object, or structure must satisfy at least one of the following four criteria:

1. It is associated with events that have made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States.
2. It is associated with the lives of persons important to local, California, or national history.
3. It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values.
4. It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

Historical resources eligible for listing in the CRHR must also retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. For the purposes of eligibility for the CRHR, integrity is defined as “the authenticity of an historical resource’s physical identity evidenced by the survival of characteristics that existed during the resource’s period of significance” (California Office of Historic Preservation 2001). This general definition is generally strengthened by the more specific definition offered by the NRHP—the criteria and guidelines on which the CRHR criteria and guidelines are based upon.

California Environmental Quality Act

CEQA Section 15064.5 *Determining the Significance of Impacts to Archeological and Historical Resources* requires that all private and public activities not specifically exempted be evaluated against the potential for environmental damage, including effects to historical resources. Historical resources are recognized as part of the environment under CEQA. It defines historical resources as “any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California.”

Lead agencies have a responsibility to evaluate historical resources against the CRHR criteria prior to making a finding as to a proposed Project’s impacts to historical resources. Mitigation of adverse impacts is required if the proposed Project will cause substantial adverse change to a historical resource. Substantial adverse change includes demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired. While demolition and destruction are fairly obvious significant impacts, it is more difficult to assess when change, alteration, or relocation crosses the threshold of substantial adverse change. The CEQA Guidelines provide that a Project that demolishes or alters those physical characteristics of an historical resource that convey its historical significance (i.e., its character-defining features) can be considered to materially impair the resource’s significance. The CRHR is used in the consideration of historical resources relative to significance for purposes of CEQA. The CRHR includes resources listed in, or formally determined eligible for listing in, the NRHP, as well as some California State Landmarks and Points of Historical Interest. Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts), or that have

been identified in a local historical resources inventory, may be eligible for listing in the CRHR and are presumed to be significant resources for purposes of CEQA unless a preponderance of evidence indicates otherwise.

Generally, a resource shall be considered by the lead agency to be a “historical resource” if it:

1. Is listed in, or determined to be eligible by the State Historical Resources Commission for listing in, the California Register of Historical Resources (PRC Section 5024.1, Title 14 CCR, Section 4850 et seq.).
2. Is included in a local register of historical resources, or is identified as significant in an historical resource survey meeting the requirements of PRC Section 5024.1(g).
3. Is a building or structure determined to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California.

City of Los Angeles Historic-Cultural Monument

According to the City of Los Angeles Cultural Heritage Ordinance Chapter 9, Division 22 (Cultural Heritage Ordinance) of the Los Angeles Administrative Code, Historic-Cultural Monument designation is reserved for those resources that have a special aesthetic, architectural, or engineering interest or value of a historic nature. Any site (including significant trees or other plant life located on a site), building or structure of particular historic or cultural significance to the City of Los Angeles, can be designated as long as it is a historic structure or site:

- a. in which the broad cultural, economic or social history of the nation, State, or community is reflected or exemplified; or
- b. that is identified with historic personages or with important events in the main currents of national, State or local history; or
- c. that embodies the distinguishing characteristics of an architectural type specimen, inherently valuable for a study of a period, style or method of construction; or
- d. that is a notable work of a master builder, designer, or architect whose individual genius influenced his or her age.

A proposed resource may be eligible for local designation as a Historic-Cultural Monument if it meets at least one of the criteria above.

Los Angeles Unified School District

The *LAUSD Historic Context Statement, 1870 to 1969* (Sapphos 2014), establishes guidelines for evaluating the significance of LAUSD campuses. The LAUSD Historic Context Statement outlines historic contexts and themes, with eligibility standards, character-defining features, and integrity considerations for each. Irving MS was considered under the appropriate contexts and themes, and associated property types, period of significance, areas of significance, and geographic location. The applicable eligibility standards, character-defining features, and integrity considerations for both individual significance and significance as a historic district are provided in the *LAUSD Historic Context Statement* (Sapphos 2014:141-143). The context and theme that apply to Irving MS are as follows:

Area of Significance: A/1

- Context: Public and Private Institutional Development/Education
- Theme: LAUSD/Post–1933 Long Beach Earthquake School Plants
- Property Type: Institutional/Educational

6. Significance Evaluation

Property Subtypes: Elementary, Junior High, and High School Buildings and Campuses

- Period of Significance: 1933 to 1945
- Area of Significance: Education
- Geographic Location: Citywide

Eligibility Standards

- Exemplifies post-Long Beach earthquake school planning and design concepts of the period, including requirements under the 1934 Field Act
- One-story massing for elementary schools; up to two stories for junior/high schools

Character-Defining Features

Buildings/Structures

- One-story massing for elementary schools; up to two stories for middle and senior high schools
- Reinforced concrete, steel-, or wood-frame construction
- Generous expanses of windows, including steel- and wood-framed multi-light windows, awning and hopper casements, clerestories, and large-pane fixed windows; window groupings often mark the location of classrooms
- Stylistically more streamlined and less ornamental than 1920s period-revival styles
- Styles can also include PWA Streamline Moderne, Art Deco, Late Moderne, and proto-modern styles
- May have been partially or fully funded through Works Progress Administration (WPA), 1935 to 1943
- WPA projects may include significant interior artwork such as murals, paintings, and sculpture
- May have been designed by a prominent architect of the period

Campus/District

- Unified site plan consisting of buildings and structures designed and sited according to their use
- Varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Campus often composed of groupings of classroom wings, auditoriums, gymnasiums, cafeterias, and outdoor recreation and dining areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations

- Should retain most of the essential physical features from the period of significance
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Schools from this period generally include buildings constructed after the period of significance, in particular post-World War II buildings, which may be noncontributing
- Eligible properties under this theme may be a single building, if it exemplifies the design ideals of the era, or a grouping (campus) of buildings constructed during the period of significance

- Intact campus groupings from the pre-1945 era are not common
- Should retain integrity of Materials, Design, Workmanship, Feeling, and Association from its period of significance

Area of Significance: C/3

According to the *LAUSD Historic Context Statement*, buildings exhibiting distinctive design features might also qualify under Criteria C/3, as the embodiment of the distinctive characteristics of a type/period or method of construction, as an example of the work of a master architect, or for high artistic values.

Architectural Style: PWA Moderne

Created by the National Industrial Recovery Act, the Public Works Administration, commonly known as the PWA, was founded within a few months of the March 1933 Long Beach Earthquake. Following widespread damage to Los Angeles public schools in the wake of the earthquake, much school reconstruction work was funded by the PWA. Consequently, a substantial number of Los Angeles public schools either built or remodeled during this time exhibit some degree of PWA Moderne styling. Also referred to as “Stripped Classicism,” the PWA Moderne often incorporates elements of a number of styles, including Classical Revival, Spanish Colonial Revival, Art Deco, and Streamline Moderne.

Compared with the Streamline Moderne, the PWA Moderne was more formal and symmetrical in its overall design, with less emphasis on curvilinear shapes and horizontality. This style is found throughout the United States, particularly for institutional buildings funded through the PWA. Although the PWA program was terminated in 1943, buildings continued to display these character-defining features.

- Emphasis on the vertical axis
- Symmetrical, formal design composition and massing
- Smooth wall surfaces, generally exhibiting stucco, concrete, and/or polished stone (rarely includes brick exterior elements)
- Usually displays a flat roof
- Piers, often fluted or reeded, separating recessed window channels
- Incorporation of shallow relief panels and interior murals (Sapphos 2014:124)

SurveyLA notes additional character-defining features of PWA Moderne schools:

- Formal symmetry and massing
- Pier supports (rather than columns)
- Windows arranged in vertical recessed bays
- Stripped appearance with minimal ornamentation, including some zigzags, medallions, or plaster reliefs
- Generally features a two-story rectangular-shaped main administration building with separate additional buildings for cafeterias, auditoriums, gymnasiums, and classrooms (HRG 2017)

Evaluation of Eligibility

ASM considered the campus and the six original buildings for significance under the broad themes of Education and Architecture and the eligibility criteria described in the preceding section. The original section of the campus was evaluated as a potential historic district (Washington Irving Middle School Historic District), and six original buildings were evaluated for individual significance (Administration, Auditorium, Physical Education, Cafeteria, and two Shops). The period of significance is 1936–1939,

6. Significance Evaluation

encompassing the years of construction of the campus core. Recommended contributors/noncontributors are shown in Table 1. The recommended boundary of the historic district is shown in Figure 76.

NRHP/CRHR Evaluation

With this evaluation, ASM confirms previous surveys suggesting Irving MS appears to be eligible for NRHP/CRHR listing. Heumann (2002) gave the campus a status code of 3S (eligible through survey evaluation), although the report did not specify which criteria were under consideration, nor whether the code referred to the individual buildings or the campus as a historic district. In a survey from the public right-of-way, SurveyLA identified the campus as a potential historic district but did not consider the buildings individually (HRG 2017). Following the guidelines presented in the *LAUSD Historic Context Statement*, ASM recommends the Washington Irving Middle School Historic District eligible for NRHP/CRHR listing under criteria A/1 and C/3. Because they were constructed at the same as the other contributors and designed by the same architect who designed the Cafeteria, Shop No. 1 and Shop No. 2 are also recommended contributors. Four of the buildings that are recommended contributors are not recommended individually eligible under the same criteria, as shown in the table below and as described in the following sections.

Historic District Eligibility

Table 1. Recommended Contributors/Noncontributors to the Washington Irving Middle School Historic District

Building Name	Year Designed/ Constructed	Architect	Contributor/ Noncontributor	Individually Eligible	Criteria	CA SHPO Status
Administration	1936/1937	Bergstrom	Contributor	No	A/1 and C/3	3D
Auditorium	1939	Bergstrom	Contributor	No	A/1 and C/3	3D
Physical Education	1936/1937	Bergstrom	Contributor	No	A/1 and C/3	3D
Cafeteria	1937	Nibecker	Contributor	No	A/1 and C/3	3D
Shop No. 1	1937	Nibecker	Contributor	No	A/1	3D
Shop No. 2	1937	Nibecker	Contributor	No	A/1	3D

Criterion A/1. The historic core of Irving MS (comprising six 1930s buildings) meets the eligibility standards established in the *LAUSD Historic Context Statement* for significance under Criterion A/1 and theme of LAUSD Post-1933 Long Beach Earthquake School Plants. The campus exemplifies post-Long Beach earthquake school planning and design concepts of the period, including requirements under the 1934 Field Act. The two-story and story-and-a-half massing is consistent with eligible junior high schools of the era. The *LAUSD Historic Context Statement* states that intact campus groupings from the pre-1945 era are not common, raising the significance of the Irving MS campus core. Finally, the campus and the individual buildings retain most of the associative and character-defining features from the recommended period of significance, which is within the potential period of significance for the theme of 1933 to 1945. Therefore, the Washington Irving Middle School Historic District is recommended eligible for the NRHP/CRHR under Criterion A/1 as an intact campus grouping illustrating post-Long Beach earthquake school planning and design concepts. The specific period of significance for this district under NRHP/CRHR Criterion A/1 is 1936-1939, encompassing the years of planning and design for the campus core.

Criterion B/2. Research revealed no evidence that any important person was directly associated with the campus. Therefore, the Washington Irving Middle School Historic District is recommended not eligible under Criterion B/2 for listing in the NRHP/CRHR.

Criterion C/3. The historic core of Irving MS comprising six 1930s buildings meets the eligibility standards established in the *LAUSD Historic Context Statement* for significance under Criterion C/3 for the

theme of LAUSD Post–1933 Long Beach Earthquake School Plants. The group of buildings exhibits several of the features outlined for significance under Architecture. Specifically, the original campus presents a unified site plan consisting of a varied collection of buildings designed and sited according to their use, differentiated by function (rather than a single building with all functions inside, as was common among earlier campuses); that is, the original campus classrooms and administrative functions were contained in a single building, the Auditorium served primarily as a performance space, the physical education functions were in a separate building, and the Cafeteria provided the food services. Middle schools often included a gymnasium designed in the style of the campus overall, as is the case with the Physical Education building at Irving MS. The Irving MS campus was partially or fully funded through WPA, which was extant from 1935 through 1943 and often included significant interior artwork such as murals, like the terrazzo mural in the Auditorium. The three original buildings were designed by prominent architect Edwin Bergstrom with district architect Alfred S. Nibecker, Jr., contributing the design of the Cafeteria and Shops, following the established design for the campus. The campus exhibits the character-defining features of PWA Moderne architecture, it represents the work of a master architect, and it possesses high artistic values. Therefore, the Washington Irving Middle School Historic District is recommended eligible for the NRHP/CRHR under Criterion C/3 as an intact campus grouping illustrating post–Long Beach earthquake school planning and design concepts. The period of significance for this district under NRHP/CRHR Criterion C/3 is 1936–1939, encompassing the years of construction of Bergstrom’s PWA Moderne campus.

Criterion D/4. The Washington Irving Middle School Historic District is recommended not eligible for listing in the NRHP/CRHR under Criterion D/4 because it is a common property type that does not have the potential to provide information about history that cannot be found through historic research.

Character-Defining Features

The main buildings of the Irving MS campus exhibit the typical general character-defining features of PWA Moderne architecture as identified in the *LAUSD Historic Context Statement*.

- Emphasis on the vertical axis
- Symmetrical, formal design composition and massing
- Smooth wall surfaces, generally exhibiting stucco, concrete, and/or polished stone
- Flat roofs
- Piers, often fluted or reeded, separating recessed window channels
- Incorporation of shallow relief panels and interior murals

Administration Building

- Horizontal dentil and cresting (double-fluted) molded plaster stringcourses at top of parapet and above second-floor windows
- Simple plaster stringcourses below second-floor windows and above first-floor windows
- Molded plaster medallions above entrances
- Flat canopies with horizontal bands sheltering entrances
- Concrete exterior with prominent horizontal board-form textures
- Cutout lettering identifying building on canopy above primary entrance
- Projecting wide fluted plaster pilasters flanking entrances and marking divisions between groups of windows
- Four-over-four wood multi-light recessed sash arranged in channels
- Vertically oriented multi-light windows in stairways
- Multi-story sections of glass blocks at southwest and northeast façades
- Glass blocks flanking entrances at ground floor
- Concrete grilles covering secondary windows

6. Significance Evaluation

Interior

- Multi-light transoms

Auditorium

- Horizontal dentil and cresting (double-fluted) molded plaster stringcourses at top of parapet and above windows
- Wide fluted plaster piers between windows
- Wood windows in three-by-two– over three-by-five–light configuration
- Wide fluted pilasters flanking entrance
- Cutout bronze letters in serif font identifying building attached to northwest (primary) façade
- Concrete exterior with prominent horizontal board-form texture
- Concrete grilles covering secondary windows
- Stepped configuration of exterior walls marking location of stage
- Historical plaques

Interior

- Washington Irving–themed terrazzo mural in lobby
- Round suspended chandeliers and curvilinear ceiling motif in lobby
- Stage flanked by curved walls
- Cast-iron and molded plywood foldable seating
- Round suspended chandeliers
- Curved wood base of wood stairs at each side of stage
- Wood flooring on stage and in backstage area
- Two-panel wood doors in backstage area

Physical Education Building

- Horizontal dentil molding below parapet
- Wood four-over-four sash, regularly spaced in recessed channels at second floor
- Three-part wood awning-type windows in pairs on second-floor windows at northeast and southwest façades
- Wide fluted plaster piers from top of parapet to bottom of second-floor windows at northeast (primary) and southwest façades
- Plaster medallions centered on northeast façade above second-story windows
- Concrete exterior with prominent horizontal board-form texture
- Cutout bronze serif letters identifying building attached to northeast façade

Interior

- Curved wall with railing at approach to staircases
- Parquet wood floors in gymnasium
- Vertically oriented multi-light window in stairwells

Cafeteria

- Stringcourse with horizontal bands encircling the building below top of parapet
- Flat canopies and sunshades with horizontal bands
- Cutout bronze letters identifying building attached to northwest façade
- Square catchment boxes with horizontal bands atop round downspouts
- Small round vents at tops of walls
- Vertically oriented multi-light windows paired in groups of two or three with fluted divisions

Interior

- Two-panel wood doors
- Rectangular multi-light skylights
- Moderne-style water station in faculty dining room

Individual Eligibility

The four major original campus buildings exhibit most of the character-defining features listed in the *LAUSD Historic Context Statement*, with the exception of classroom wings designed for easy access to outdoors and an emphasis on “traditional Southern Californian” styles. As described in the context statement, the PWA Moderne style is more streamlined and less ornamental than 1920s period-revival styles. The Irving MS buildings were partially or fully funded through WPA, which was extant from 1935 through 1943. The campus buildings were designed by Edwin Bergstrom, a prominent architect of the period, with Alfred S. Nibecker, Jr., contributing the design of the Cafeteria and Shops, following the design established by Bergstrom. The recommended contributors exemplify Post-1933 Long Beach Earthquake buildings; however, they are not individually outstanding examples of the theme under Criterion A/1. Research revealed no evidence that any important person was directly associated with any individual building. Therefore, none of the contributors is recommended individually eligible under Criterion B/2. Under Criterion C/3, four of the contributors exhibit the character-defining features of a PWA Moderne building. However, none rises to the level of individual significance. None of the contributors is recommended individually eligible under Criterion D/4 because they do not have the potential to provide information about history that cannot be found through historic research. In summary, none of the Irving MS buildings is recommended individually eligible for the NRHP/CRHR under any criteria.

City of Los Angeles Eligibility

A resource may be eligible for local designation as a Historic-Cultural Monument (HCM) if it meets at least one of the criteria specified in the preceding section. Under these guidelines, the historic core of the Irving MS campus could be considered potentially eligible because it meets criterion (a), as a reflection of broad cultural and economic events. On the federal level, the campus was partially funded by the PWA, a program of the New Deal to bolster the economy following the Great Depression. On the state and local level, the campus exemplifies the type of school built according to new construction regulations developed in response to the 1933 Long Beach Earthquake. The campus is also potentially eligible under criterion (c) as embodying the distinguishing characteristics of an architectural style and method of construction from a particular period. Finally, it is potentially eligible under criterion (d) as a notable work of Edwin L. Bergstrom, a master architect whose individual work influenced this era of architecture in Los Angeles.

Integrity

Finally, Irving MS retains integrity of all seven aspects of integrity. The buildings have not been moved; therefore, the campus retains integrity of *Location*. The combination of elements that create the form, plan, space, structure, and style of the campus remains; therefore, it has integrity of *Design*. Although the neighborhood has developed in the vicinity of the school, it remains primarily residential. Many single-family houses date from the 1920s and 1930s, contemporaneous with the campus. Although infill in the form of backhouses and large multi-family apartment buildings is common, the campus retains the basic physical conditions under which it was built and the function of serving students in the immediate neighborhood. Therefore, it retains integrity of *Setting*. With largely unaltered building exteriors, the campus retains integrity of *Materials* and *Workmanship*. Finally, the physical features of the PWA Moderne architectural style are closely tied to historical events, specifically reconstruction following the 1933 Long Beach Earthquake and federal funding through the PWA in response to the Great Depression beginning in 1929. Therefore, Irving MS retains integrity of *Feeling* and *Association*. Regarding LAUSD integrity considerations, the significance of schools from this period is not affected by later additions to the cam-

6. Significance Evaluation

pus, and the rarity of intact campus groupings from the pre-1945 era might contribute to their significance. The *LAUSD Historic Context Statement* established that the essential aspects of integrity for resources eligible under this theme are Materials, Design, Workmanship, Feeling, and Association.

In accordance with the *LAUSD Historic Context Statement*, the campus retains all of the essential physical features from the period of significance. Very few, if any, materials have been removed or altered. Fencing of the site is acceptable. Although Irving MS includes buildings constructed after the period of significance, the inclusion of noncontributing buildings, in particular post-World War II buildings, such additions do not impact the significance of the campus.

7. CONCLUSION

ASM carefully considered the potential significance of Irving MS under the criteria described in this report. ASM recommends the Washington Irving Middle School Historic District eligible for listing in the NRHP, CRHR, and Los Angeles HCM, under criteria A/1/a and C/3/c and d. The campus is recommended as historically significant under the guidelines set forth in the *LAUSD Historic Context Statement*. As such, ASM recommends that the Washington Irving Middle School Historic District is a historical resource in accordance with CEQA and a historic property in accordance with NHPA.

13	lemon bottlebrush	<i>Callistemon citrinus</i>	19	20		20/6/5/13	A	C	Significant	in concrete cutout, MPE, leans NE, diameter measured at 3.5 feet, HR
14	paperbark	<i>Melaleuca quinquenervia</i>	16.6	25		12/12/10/14	A-	B	Significant	in concrete cutout, MPE
15	paperbark	<i>Melaleuca quinquenervia</i>	15.2	20		9/9/10/12	A	B	Significant	in concrete cutout, MPE, MBA
16	Western sycamore	<i>Platanus racemosa</i>	14.6	30		20/14/15/20	B	B	Protected	in concrete cutout, MPE, some dieback, CLPD, asphalt uplift
17	Chinese elm	<i>Ulmus parvifolia</i>	17.5	30		21/15/25/22	A	B+	Significant	in concrete cutout, MPE
18	Chinese elm	<i>Ulmus parvifolia</i>	15.6	20		22/18/21/17	B+	B+	Significant	in concrete cutout, MPE, EG throughout
19	carrotwood	<i>Cupaniopsis anacardioides</i>	9, 14.2	35		15/15/15/15	A	B	Significant	pruned for building clearance, diameters measured at 5 feet, MPE
20	carrotwood	<i>Cupaniopsis anacardioides</i>	5.7, 7.7	22		12/5/18/5	A	B	Significant	minor decay at base, codoms at base, MPE
21	African sumac	<i>Searsia lancea</i>	6.3, 6.7	20		12/18/15/8	A-	B	Significant	MPE, pruned for building clearance, leans E, some exposed roots
22	jacaranda	<i>Jacaranda mimosifolia</i>	9.4, 11, 14.5	25		18/22/28/25	A	B	Significant	codoms at base, MPE, exposed roots, EG

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (dbh) In inches	Overall Height	Brown Trunk Height (just for palms)	Canopy Spread (N/E/S/W)	Health	Structure	"Protected" or "Significant"	Comments
23	Canary Island pine	<i>Pinus canariensis</i>	24.8	55		8/20/25/25	A	B+	Significant	large burls on lower trunk, MPE
24	Canary Island pine	<i>Pinus canariensis</i>	16.8	50		12/7/8/21	A	B+	Significant	MPE, pruned for building clearance
25	Canary Island pine	<i>Pinus canariensis</i>	21.8	28	18	12/12/12/12	A-	B+	Significant	some dead fronds in canopy
26	Canary Island pine	<i>Pinus canariensis</i>	28.3	38	30	12/12/12/12	A-	B+	Significant	some dead fronds in canopy
27	Canary Island pine	<i>Pinus canariensis</i>	28.5	42	35	13/13/13/13	A-	B+	Significant	some dead fronds in canopy
28	California fan palm	<i>Washingtonia filifera</i>	32.2	36	30	7/7/7/7	B	B+	Significant	some dead fronds in canopy, sparse
29	Canary Island date palm	<i>Phoenix canariensis</i>	27	28	20	12/12/12/12	A	B	Significant	some dead fronds in canopy, hourglass
30	kurrajong	<i>Brachychiton populneus</i>	8.3	18		8/14/14/10	A	B+	Significant	MPE
31	Victorian box	<i>Pittosporum undulatum</i>	10.8	20		15/13/6/13	A	B-	Significant	mechanical dame, GR, leans N, sunburn canker
32	carrotwood	<i>Cupaniopsis anacardioides</i>	10.5	16		12/12/10/12	B	B	Significant	MPE, MBA, mechanical damage, exposed roots with decay
33	weeping bottlebrush	<i>Callistemon viminalis</i>	14.2	28		10/5/18/17	B+	B	Significant	unbalanced canopy to the S
34	weeping bottlebrush	<i>Callistemon viminalis</i>	19.3	25		12/8/0/25	A	B-	Significant	included bark, MBA, MPE
35	weeping bottlebrush	<i>Callistemon viminalis</i>	8.8	22		11/4/2/10	A-	B+	Significant	unbalanced canopy to the NW
36	weeping bottlebrush	<i>Callistemon viminalis</i>	4, 5.7	18		10/2/0/10	B-	C	Significant	cankers, HR, shaded out
37	weeping bottlebrush	<i>Callistemon viminalis</i>	15.5	25		15/13/11/16	A-	B+	Significant	MPE, cavities
38	weeping bottlebrush	<i>Callistemon viminalis</i>	9.3	20		14/6/3/7	B+	B+	Significant	MPE, some exposed roots
39	weeping bottlebrush	<i>Callistemon viminalis</i>	10.4, 11.5	25		22/3/0/20	A-	B-	Significant	leans NW, large crack on trunk, codoms at 2 feet fused together
40	weeping bottlebrush	<i>Callistemon viminalis</i>	11.1	20		12/15/15/8	A-	B	Significant	trunk leans SE, MPE
41	weeping bottlebrush	<i>Callistemon viminalis</i>	9.6	28		7/10/6/4	A	B+	Significant	MPE
42	weeping bottlebrush	<i>Callistemon viminalis</i>	11.5	25		10/13/3/14	A	B+	Significant	MPE
43	weeping bottlebrush	<i>Callistemon viminalis</i>	11.3	25		15/8/5/10	A	B+	Significant	MPE, leans NW
44	weeping bottlebrush	<i>Callistemon viminalis</i>	11.1	22		15/3/0/12	A	B+	Significant	MPE, leans NW, small hanger in canopy
45	Chinese elm	<i>Ulmus parvifolia</i>	14	25		15/7/0/18	B-	B	Significant	MPE, a bit sparse, some deadwood in upper canopy
46	Chinese elm	<i>Ulmus parvifolia</i>	12.6	25		15/15/15/25	B	B	Significant	MPE, a bit sparse, some deadwood in upper canopy
47	Chinese elm	<i>Ulmus parvifolia</i>	11.6	22		15/12/12/15	B	B	Significant	MPE, a bit sparse, some deadwood in upper canopy

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (dbh) In inches	Overall Height	Brown Trunk Height (just for palms)	Canopy Spread (N/E/S/W)	Health	Structure	"Protected" or "Significant"	Comments
48	Chinese elm	<i>Ulmus parvifolia</i>	16.8	30		32/15/23/28	B	B	Significant	MPE, a bit sparse, some deadwood in upper canopy
49	Chinese elm	<i>Ulmus parvifolia</i>	15.3	35		15/13/30/16	B	B	Significant	MPE, a bit sparse, some deadwood in upper canopy
50	Chinese elm	<i>Ulmus parvifolia</i>	8.4	20		14/8/10/15	B-	B-	Significant	sparse, EG
51	Indian laurel fig	<i>Ficus microcarpa</i>	25.2	40		22/10/8/25	A	B	Significant	pruned for building clearance, diameter measured at 2.5 feet, MPE, MBA
52	Indian laurel fig	<i>Ficus microcarpa</i>	25.5	35		22/15/10/18	A	B	Significant	pruned for building clearance, diameter measured at 2 feet, MPE, MBA
53	carrotwood	<i>Cupaniopsis anacardioides</i>	9.8	18		15/12/8/12	B	B	Significant	MPE, MBA, EG, cracked limb on W side recommended for removal
54	Chinese elm	<i>Ulmus parvifolia</i>	8.5, 8.7	20		21/18/18/20	A-	B	Significant	minor GR, codoms at 2 feet, MPE
55	carrotwood	<i>Cupaniopsis anacardioides</i>	9	16		12/12/14/16	B	B	Significant	EG, mechanical damage, MPE
56	carrotwood	<i>Cupaniopsis anacardioides</i>	8.4	16		12/12/10/12	A-	B+	Significant	EG, mechanical damage, MPE
57	weeping bottlebrush	<i>Callistemon viminalis</i>	11.3	20		10/15/10/12	A	B+	Significant	some exposed roots, MPE
58	weeping bottlebrush	<i>Callistemon viminalis</i>	10.2	22		10/10/12/12	B-	B-	Significant	a bit sparse, small GR, MPE
59	carrotwood	<i>Cupaniopsis anacardioides</i>	10	20		12/12/12/12	A-	B	Significant	HOB, MPE, EG
60	weeping bottlebrush	<i>Callistemon viminalis</i>	15	30		12/10/14/16	A-	B	Significant	exposed roots with minor decay, unbalanced canopy to S, MPE, large seam on N trunk
61	lemon bottlebrush	<i>Callistemon citrinus</i>	8.7, 8.1, 6, 10.1	25		10/15/10/15	A	B	Significant	codoms at base, MPE, one trunk removed, EG
62	lemon bottlebrush	<i>Callistemon citrinus</i>	10.1	20		10/10/9/8	B+	B-	Significant	two large trunks removed or failed, MPE
63	lemon bottlebrush	<i>Callistemon citrinus</i>	5.2, 8.5, 4.5, 5.7, 5.6	16		10/12/10/10	A	B	Significant	codoms at base, one trunk removed or failed, MPE
64	Chinese elm	<i>Ulmus parvifolia</i>	18	22		12/17/20/15	B+	B-	Significant	MPE, a bit sparse, some deadwood in upper canopy, topped
65	carrotwood	<i>Cupaniopsis anacardioides</i>	11.3	20		15/12/13/14	A-	B	Significant	EG, MBA, MPE
66	carrotwood	<i>Cupaniopsis anacardioides</i>	8.7	18		12/12/12/12	B	B	Significant	EG, mechanical damage, MPE
67	Western sycamore	<i>Platanus racemosa</i>	5.8	22		10/12/14/10	B+	B	Protected	appears planted, a bit sparse, CLPD
68	Victorian box	<i>Pittosporum undulatum</i>	12.8, 10.3	40		12/12/7/3	B+	C+	Significant	pruned for building clearance, MPE, EG, decay at base, codoms at 1.5 feet, COD
69	Victorian box	<i>Pittosporum undulatum</i>	12.2	30		12/16/6/3	A-	B	Significant	pruned for building clearance, MPE, EG,
70	Victorian box	<i>Pittosporum undulatum</i>	12.5, 15.1	40		6/14/18/0	B-	D	Significant	pruned for building clearance, MPE, EG, codoms at 1 foot, cavities, some deadwood in upper canopy, deadwood at base, southern trunk should be removed
71	Chinese elm	<i>Ulmus parvifolia</i>	6.4, 7, 4.2, 3.8, 5.4, 4	25		22/18/15/18	B-	C+	Significant	codoms at base, sparse, mechanical damage, HOB, decay throughout

Tree #	Common Name	Botanical Name	Diameter at 4.5 feet (dbh) In inches	Overall Height	Brown Trunk Height (just for palms)	Canopy Spread (N/E/S/W)	Health	Structure	"Protected" or "Significant"	Comments
72	laurel leaf snailseed	<i>Cocculus laurifolius</i>	2, 3.2, 2.2, 3.6	14		10/11/3/5	B-	B-	Significant	sparse, partially shaded out, codoms at base
73	laurel leaf snailseed	<i>Cocculus laurifolius</i>	2.8, 3.1, 4.6	15		11/5/8/0	B	B-	Significant	sparse, partially shaded out, codoms at base

Attention: Peyman Soroosh Moghadam

Subject: Geotechnical and Geohazards Investigation for
Irving Middle School Modernization
3010 Estara Avenue
Los Angeles, CA 90065

Dear Mr. Moghadam:

In accordance with your request, a geotechnical and geohazards investigation has been completed for the above referenced project. The report addresses both engineering geologic and geotechnical conditions. The results of the investigation are presented in the accompanying report, which includes a description of site conditions, results of our field exploration, laboratory testing, conclusions, and recommendations.

This report has been updated with data from six additional borings completed in December 2022 and January 2023.

We appreciate this opportunity to be of continued service to you. If you have any questions regarding this report, please do not hesitate to contact us at your convenience.

Respectfully submitted,

RMA Group

1.00 INTRODUCTION

1.01 Purpose

A geotechnical and geohazards investigation has been completed for the modernization of Irving Middle School in Los Angeles, California (Figure 1). The purpose of the investigation was to summarize geotechnical and geologic conditions at the site, to assess their potential impact on the proposed development, and to develop geotechnical and engineering geologic design parameters. This report has been further updated with data obtained by six additional borings completed in December 2022 and January 2023.

1.02 Scope of the Investigation

The general scope of this investigation included the following:

- Review of published and unpublished geologic, seismic, groundwater and geotechnical literature.
- Review of a prior geohazards investigation prepared by this office dated November 30, 2018 for the existing modular buildings in the west side of campus. Investigation included 1 soil boring and 3 CPTs. The location of the prior boring and CPTs are included on Figure 2 and copies of the logs are included in Appendix A.
- Examination of aerial photographs.
- Contacting of underground service alert to locate onsite utility lines.
- Obtaining a well construction permit from the County of Los Angeles Environmental Health Department.
- Scanning of the proposed boring locations with ground penetrating radar.
- Logging, sampling and backfilling of 9 exploratory borings drilled with a CME-75 drill rig and 6 exploratory borings drilled with a limited access tracked auger drill rig.
- Advancement of 12 cone penetrometer (CPT) soundings.
- Completion of a Geophysical Survey consisting of 5 seismic lines (Figure 2). Seismic lines 1-4 are included in Appendix A, Seismic line 5, on the west side of campus along West Avenue 32 is not included due to subsurface utilities that created unusable data.
- Laboratory testing of representative soil samples.
- Geotechnical evaluation of the compiled data.
- Preparation of this report presenting our findings, conclusions and recommendations.

Our scope of work did not include a preliminary site assessment for the potential of hazardous materials onsite.

1.03 Site Location and Description

Irving Middle School is located at 3010 Estara Avenue, Los Angeles, California. Its geographic position is at latitude 34.11664° and longitude -118.24244°. The approximate location of the campus is shown on Figure 1.

The school is bounded by Fletcher Drive to the north, Estara Avenue to the east, Marguerite Street to the south, and West Avenue 32 to west. Retail and residential properties are located to the west of campus at the intersection of

Fletcher and West Avenue 32 and are not part of this study. The campus consists of 11 permanent buildings and 6 portable buildings on 11.18 acres (Figure 2). The vegetation consists of some shrubs and trees around the perimeter and scattered throughout the grounds of the campus. A grass athletic field is located at the north corner of campus and an artificial turf field of located at the south corner of campus.

1.04 Current and Past Land Usage

The Administration Building, Auditorium, Shop 1 and 2 Buildings and PE Building are part of the original construction at the campus, being completed in 1937 and constructed on the south and east portion of the campus. Shop #3 Building was constructed in the late 1950's on the west side of campus. The Classroom and Homework Buildings were constructed in the late 1950's on the south side of campus. The new Classroom Building, located between the PE Building and Classroom and Homework Buildings was constructed in the late 1980's.

The portable buildings have occupied the northwest area of the campus since at least 1972 and the number of units has fluctuated during that time period.

1.05 Planned Usage

It is our understanding that the proposed project will consist of the seismic evaluation for the eventual modernization of the Administration Building, PE Building and Auditorium (Figure 2).

Our investigation was performed prior to the preparation of grading or foundation plans. To aid in preparation of this report, we utilized the following assumptions:

- Maximum foundation loads of 2 to 3 kips per linear foot for continuous footings and 60 kips for isolated spread footings.
- Cuts and fills will be less than 5 feet.

1.06 Investigation Methods

Our investigation consisted of office research, field exploration, laboratory testing, review of the compiled data, and preparation of this report. It has been performed in a manner consistent with generally accepted engineering and geologic principles and practices, and has incorporated requirements of California Geological Survey Note 48 and the 2022 California Building Code (CBC). Definitions of technical terms and symbols used in this report include those of the ASTM International, the California Building Code, and commonly used geologic nomenclature.

Technical supporting data are presented in the attached appendices. Appendix A presents a description of the methods and equipment used in performing the field exploration and logs of our subsurface exploration. Appendix B presents a description of our laboratory testing and the test results. Appendix C presents our General Earthwork and Grading Specifications. Appendix D presents the results of site-specific seismic hazard analysis including the development of design acceleration response spectra for this project. Seismically induced settlement calculations, and References are presented in Appendices E and F, respectively.

2.00 FINDINGS

2.01 Geologic Setting

The site is located on the Los Angeles coastal plain. This plain is lowland that gently slopes seaward. It is underlain by as much as about 30,000 feet of sediments that rest on granitic and metamorphic basement rocks. The plain is bounded by the Santa Monica Mountains to the north, the Puente Hills to the east, the Santa Ana Mountains and San Joaquin Hills to the south, and the Palos Verde Hills and Pacific Ocean shoreline to the west. The dominant structural feature of the Los Angeles coastal plain is the northwest trending Newport-Inglewood fault zone.

The campus is located on the east side of the Los Angeles River Valley between the eastern edge of the San Gabriel Mountains and the west edge of the Repetto Hills.

2.02 Earth Materials

Our subsurface investigation encountered surficial asphalt and concrete typically between 2 to 4 inches thick over up to 6 inches of base. Specific surface conditions are described on the boring logs with thickness of any surface pavement at the location of the borings. Our borings and CPTs also encountered artificial fill (disturbed soil), older alluvium and sedimentary bedrock.

Artificial fill or soil disturbed by prior construction was encountered throughout the site to a depth of about 4 feet. It consisted of brown sandy clay and based upon appearance was derived from the onsite sandy clay older alluvium.

Regional geologic mapping by Bedrossian, et al in CGS Special Report 217: Geologic Compilation of Quaternary Surficial Deposits in Southern California (2012 Revision) (Figure 3) indicates the site is underlain by late to middle Pleistocene older alluvium. Other regional mapping prepared by Dibblee, 1989, (Figure 4) indicates the site underlain by Holocene alluvium. Lamar (Figure 5) in his 1970 geologic map indicates the site is underlain by Pleistocene old alluvium.

The older alluvium typically encountered in our borings north of the fault consisted of clay from a depth of 4 to 17 feet, silty sand from a depth of 17 to 30 feet, clayey sand from 30 to 39 feet, and clay from 44 to 50.5 feet. CPT soundings classify the majority of the alluvium as clay, silty clay and as very dense/stiff soil which is generally consistent with the soil types encountered in our borings. The blow counts of the soil in the borings and the data from the CPT logs indicate that the clay and lean clay were typically very stiff to hard and the silty sand was medium dense to very dense. The CPT logs, particularly those in the north of half of campus encountered a layer of silty sand that was typically 1-2 feet thick and was encountered at depth of 13 to 17 feet. Based upon the soil data from the boring and CPT logs we concur with the more recent mapping of Bedrossian and Rofers and Lamar to classify the soil as older alluvium.

Sandstone bedrock was encountered in the borings B-1, B-6 and B-20 and CPTs CPT-2 through CPT-8 at around 30 feet below the ground surface. In the remaining borings and CPTs the bedrock was encountered at depths of 50 feet or not encountered to the depth explored. Regional mapping by Lamar shows the nearest mapped bedrock unit is the Topanga formation. We have adopted that as our classification of the bedrock unit.

A Site Geologic Map showing the locations of our borings, soundings and cross sections is presented as Figure 2. Two geologic cross sections are presented as Figures 6 and 7.

The subsurface soils encountered in our exploratory borings and soundings are described in greater detail on the logs contained in Appendix A.

2.03 Expansive Soils

Expansion testing performed in accordance with ASTM D4829 indicates that earth materials underlying the site have an expansion classification of low.

Results of expansion test and other soil index tests are presented in Appendix B. Since site grading will redistribute earth materials, potential expansive properties should be verified at the completion of rough grading.

2.04 Surface and Groundwater Conditions

Perched water layers were encountered in B-14, B-17, B-21, B-22, B-23, and B-24 around 16 to 20 feet. The seismic lines indicated a layer of water at about 17 to 20 feet. We have interpreted this as a perched layer of water based upon the changes in moisture content in the samples from the borings where moisture increased in this zone and then dropped in samples collected below 20 feet. The samples from this zone did not indicate free water either in the boring or in the samples. This increase in moisture was not found in Boring B-1, B-6 or B-20. Additionally, no free water was encountered in the borings and CPTs at their conclusion. Therefore, we have classified this as a perched layer of water, most likely from thin interbedded coarse sediment layers of sand or silty sand as illustrated in the CPTs.

According to the California Division of Mines and Geology (1998), the highest historic groundwater level beneath the site has been about 25 feet below the ground surface (Figure 8).

2.05 Faults

The site is located within the boundaries of the current (2017) State Alquist-Priolo Earthquake Fault Zone for fault-rupture hazard (Figure 10). Current Alquist-Priolo fault traces are mapped in the southern portion of campus, entering campus just south of Shop Building 3 and exiting just west of the new Classroom Building and the other fault through the grass athletic field from west to east on the north side of campus.

The southerly mapped fault is believed to be a part of the Hollywood Fault and the northerly trace is believed to be a part of the Raymond Fault. Plate 1 of California Geological Survey Fault Evaluation Report FER 260 (Figure 12) shows two other locations for the Hollywood and Raymond faults possibly passing through the school site based upon regional geologic mapping by others. Additional regional mapping by Weber (Figure 11) indicates a fault passing through the west side as shown on the Earthquake Hazard Map and maps the other fault to the north of the campus, Dibblee maps a fault through the north side of campus, Lamar does not map a fault through the site and neither does Bedrossian and Roffers (Figure 3). Figure 11 shows the site with faults included in Plate 1 of Fault Evaluation Report FER-260 including the location of the faults as mapped by Webber (1989), Weaver and Dolan (2002), Hill (1979), Dibblee (1989) and Lamar (1970). The regional mapping does not seem to have a consensus location for the faults in the area and location of the faults are based upon reports from properties in the vicinity of the campus and aerial photography and historic topographic map interpretations. Plate 1 shows the faults as dashed meaning the locations are approximate. No specific investigations are listed at the campus.

The Raymond and Hollywood faults are classified as left-lateral faults with minor elements of reverse slip. According

to the Southern California Earthquake Center (SCEC), prior investigations along with seismic data for the Raymond Fault has indicated evidence of eight subsurface ruptures in the last 36,000 years and the most recent significant event was the 1988 Pasadena Earthquake epicentered 6.3 miles east-northeast of the campus with an epicenter of 16 kilometers below the ground surface. A copy of the map associated with the CGS's Historic Online Database is included as Figure 14 and indicates the closest historic earthquake to the campus as the 1988 Pasadena Earthquake.

The accompanying Regional Fault Map (Figure 9) illustrates the location of the site with respect to major faults in the region. The distance to notable faults within 100 kilometers of the site is presented on Table 1.

2.05.1 Fault Investigation

Since the school is located within Earthquake Fault Zone, we prepared a field exploration program to investigate the locations of the mapped faults within the school. Because the school is currently active with students and contains many structures and surface improvements including concrete and asphalt paving and artificial grass athletic surfaces, we were unable to perform the fault investigation using a typical fault trench excavated across the site. Instead we utilized a series of 5 geophysical seismic refraction lines, 15 continuously logged hollow stem auger borings and 12 CPTs along with the boring and CPTs from our prior investigation at the campus to investigate the subsurface strata (Figure 2). Logs of the borings, CPTs and seismic lines are included in Appendix A.

2.05.2 Sequence of Investigation

The sequence of our investigation consisted of review of published references and reports, examination of aerial photographs, subsurface investigation, geologic analysis and preparation of this report. These stages of investigation are described below.

2.05.3 Review of Fault Evaluation Reports

The California Geological Survey prepared Fault Evaluation Report FER-260 for the Hollywood and Raymond Faults. Plate 1 of FER 260 (Figure 12) indicates three possible fault traces crossing the site and a fourth passing just north of the north side of the campus and indicates three prior investigations located 0.6 to 0.75 miles to the west of the campus. Of the three, one at Atwater Elementary School was characterized as possible Holocene activity, one was reported as no faulting found and the third was labeled as having insufficient data for fault determination. Due to the developed nature of Atwater school and for a multi-family residential development at Kazaz Lane and Casitas Avenue, investigations at those sites included CPT and boring transects as the primary investigation technique.

According to FER 260 the investigation at Atwater Elementary School included a significant drop in groundwater levels from 24 to 42 feet below ground surface in the southern portion of the site. Radiocarbon dating of samples collected from the borings indicated Holocene alluvium extends to a depth to about 40 to 50 feet. They also indicated that the site investigation did not encounter marker beds that would indicate displacement and ultimately indicated that the presence of faulting at the site was inconclusive.

2.05.4 Analysis of Aerial Photography and Historic Topographic Maps

Examination of aerial photography was performed to identify topographic and vegetation lineaments that might be indicative of the presence of near surface faulting. Unfortunately development in the area of the campus predates the earliest aerial photograph (1938) reviewed for this study. Consequently, lineaments that might have existed in

the vicinity of the campus have been obliterated.

Weber (1980) describes the Hollywood fault near the campus as “the trace of the principal fault of the Hollywood fault zone probably lies at the south edge of a topographic prominence on which Irving Junior High School is located; the conjectural fault projected through the swale at the north edge of the prominence may be a secondary fault of the zone” (Indicated as 93a of his map (Figure 11)). This south edge of a topographic high is seen on the 1936 topographic map and is in the approximate location of the fault as determined by our subsurface data discussed below.

The campus is located on a topographic hill. A copy of the original topographic map prepared for the construction of the campus, dated 1936 is included as Figure 13 and includes the identified fault trace through the campus, which based upon our data discussed below indicates a fault roughly along the south edge of the hill as described by Weber.

2.05.5 Geologic Reconnaissance

Our geologic reconnaissance in the vicinity of the campus confirmed that the area has been heavily modified by anthropic activities. Features suggestive of faulting were not found, specifically building or pavement cracking, offset fractures or other distress to the existing surface improvements and structures.

We did observe a topographic high as described by Weber and shown on the topographic map; however the current topography has been modified by further construction at the campus.

A reconnaissance of the immediate area surrounding the site was done of the surrounding roads. Breaks in slope in the roads were not observed within 200 feet of the site, although again, the area around the school has been developed and specific natural topography has been altered due to the development.

A reconnaissance of the exterior of the buildings at the campus was done during our field investigation for indications of stress on the building such as cracking of the exterior walls and out of square window and door openings, etc. Specific indications of these items were not observed. Further, surface cracking of existing pavements in the area of the mapped fault were not observed.

2.05.6 Subsurface Investigation

Due to the developed nature of the site we completed a series of borings and CPTs across the campus as shown in Figure 2. Five seismic lines were completed, with 3 along the south and west perimeter of the campus, in the landscaped areas between the road and sidewalk. One seismic line along West Avenue 32 was unusable due to interference in the data from a subsurface utility, possibly a concrete storm drain. The last of the seismic lines was placed to transect the athletic field on the north side of campus, perpendicular to the mapped trace of the Raymond fault included in the State’s Earthquake Hazard Zones map.

The locations of the borings, CPTs and seismic lines were positioned to create a transect across the campus, roughly perpendicular to mapped fault traces shown on the State’s Earthquake Hazard Zones map for the Los Angeles Quadrangle (Cross section A-A’ on Figure 6).

The borings and CPTs were advanced to 36.5 to 50 feet along this transect. CPT 4 met with refusal at less than 5 feet due to a manmade subsurface structure and was abandoned after 3 attempts were made to advance a CPT in this

area. Some borings and CPTs encountered groundwater as described in Section 2.04. These saturated layers were generally encountered at depth 15 to 20 feet and were observed to have elevated moisture contents in the samples collected. The general stratigraphy encountered in the borings and CPTs and modeled by the seismic lines are described in Section 2.02.

The borings and CPTs encountered a significant change in stratigraphy between CPT-8 and B-20 and CPT-9. CPT-9 encountered clay to a depth of 39 feet where it encountered very dense/stiff soil (based upon other borings near CPTs this corresponds to the sandstone bedrock). CPT-8 and B-20 encountered similar clay as in CPT-9 then silty sand (very dense/stiff soil) at a depth of 20 feet to 27 feet where sandstone bedrock was encountered. In the CPTs and Borings south and west of CPT-8 and B-20, the sandstone was encountered fairly consistently at 20 feet below the ground surface. Further, there is a difference of about 8 feet between the highest velocity layers encountered shown on the layer velocity model diagrams between the west end of S-2 and the east end of S-3. Additionally, the perched groundwater described in Section 2.04 occurs north of CPT-8 and B-20 and not encountered in the borings and CPTs, including CPT-8 and B-20, in the southern portion of campus.

The borings and CPTs north and east of CPT-9 include a similar stratigraphy of clay to 39 feet or more with bedrock, where encountered, at depths of 39 feet or deeper. South of CPT-8 the stratigraphy includes silty sand at 18 to 20 feet and then sandstone and claystone below 30 feet. Based upon the change in stratigraphy and occurrence of perched groundwater between CPT-8 and CPT-9, B-20 and the change in seismic velocity between S-2 and S-3 we have included a fault zone based upon the location of the CPTs and Seismic Lines (Figure 2). The location of the possible fault trace also mirrors the general stratigraphy shown on the 1936 topographic map (Figure 13).

The CPTs include layers of silty sand in the upper 20 feet north of the possible fault trace, typically 1-2 feet thick in the CPTs and where at depths of about 9 to 10 feet to 15 to 17 feet below the ground surface. South of the fault trace does not include these thin silty sand layers in the upper 20 feet of the CPTs.

2.05.7 Age Dating Techniques

Radiocarbon dating is the preferred method of age dating soil deposits. Unfortunately, the only organic material exposed by the borings consisted by the roots of existing grass sod and trees, which were not suitable for age dating soils since they would not provide an accurate age of the soil. Charcoal or other materials suitable for radiocarbon age dating were not exposed by the borings. Soil profile development is another technique commonly used in southern California for age dating soils. However, as discussed above, surface soil profiles were apparently removed and/or disturbed by placement of fill during the construction of the school beginning in 1938.

2.06 Historic Seismicity

The nearest large historic earthquake in the vicinity of site was the 1855 Los Angeles earthquake which was epicentered approximately 4 miles south of the site. The magnitude of the earthquake was estimated at 7.0. The nearest historic earthquake on the Raymond fault was the 1988 Pasadena earthquake which was epicentered approximately 6.7 miles east-northeast from the site. The magnitude of the earthquake was 5.0. Strong earthquakes that have occurred in this region in historic time and their approximate epicentral distances are summarized in Table 2. Figure 14 includes historic earthquakes within the vicinity of the site.

Our research of regional geologic and seismic data did not reveal any known instances of ground failure within the site associated with regional seismic activity.

Seismic design parameters are presented in Section 3.09.

2.07 Flooding Potential

According to Federal Emergency Management Agency (2008), the site is located within Flood Zone X, which is defined as an area of minimal flood hazard.

Control of surface runoff originating from within and outside of the site should, of course, be included in design of the project.

2.08 Landslides

Due to the low gradient of the site and surrounding area, landsliding is not a hazard at this property.

2.09 Other Geologic Hazard Considerations

California Geological Survey Note 48 (2022) identifies a number of exceptional geologic hazards that can occur at individual sites, but do not occur statewide. Evaluation of these exceptional conditions is referred to as a conditional geologic assessment by Note 48. Specific assessment items listed in Note 48 are addressed in the table below.

CONDITIONAL GEOLOGIC ASSESSMENT

Hazard	Assessment	Reference
Methane gas, hydrogen-sulfide gas, tar seeps	Not applicable, site is not located within an identified oil field and no oil wells are known to be present.	California Department of Conservation, Geologic Energy Management Division, Online Well Finder Map, and Figures 1 and 2.
Volcanic eruption	Not applicable, site is not is a known hazard area for volcanic eruptions.	Miller, 1989 (U.S.G.S. Bulletin 1847)
Flooding	The site is in an area of minimal flood hazard.	See Section 2.07
Tsunami and seiches inundation	Not applicable.	See Section 3.10
Radon-222 gas	Not applicable, typically a concern in the California Coast Ranges.	See Section 2.01 and CGS Note 48.
Naturally occurring asbestos	Not applicable, site is not in an area more likely to contain naturally occurring asbestos.	Churchill and Hill, 2000 (DMG OFR 2000-19).
Hydrocollapse due to anthropic use of water	The regional geologic setting, drilling data and field observation indicate that soils are not likely to experience hydrocollapse.	See Sections 2.01, and 2.02. Appendices A, and B.
Regional land subsidence	Not applicable.	Section 2.01, Figures 2 and 3.
Clays and cyclic softening	Cyclic softening of clay is unlikely due to the stiffness and overconsolidation of the low plasticity clays.	See Section 2.01 and 2.02. Appendix A and B.

3.00 CONCLUSIONS AND RECOMMENDATIONS

3.01 General Conclusion

Based on specific data and information contained in this report, our understanding of the project and our general experience in engineering geology and geotechnical engineering, it is our professional judgment that the proposed development is geologically and geotechnically feasible. This is provided that the recommendations presented below are fully implemented during design, grading and construction.

3.02 General Earthwork and Grading

All grading should be performed in accordance with the General Earthwork and Grading Specifications outlined in Appendix C, unless specifically revised or amended below. Recommendations contained in Appendix C are general specifications for typical grading projects and may not be entirely applicable to this project.

It is also recommended that all earthwork and grading be performed in accordance with Appendix J of the 2022 California Building Code (CBC) and all applicable governmental agency requirements. In the event of conflicts between this report and CBC Appendix J, this report shall govern.

3.03 Earthwork Shrinkage and Subsidence

Shrinkage is the decrease in volume of soil upon removal and recompaction expressed as a percentage of the original in-place volume. Subsidence occurs as natural ground is densified to receive fill. These factors account for changes in earth volumes that will occur during grading. Our estimates are as follows:

- Shrinkage factor = 7%-12% for soil removed and replaced as compacted fill.
- Subsidence factor = 0.1 foot.

The degree to which fill soils are compacted and variations in the insitu density of existing soils will influence earth volume changes. Consequently, some adjustments in grades near the completion of grading could be required to balance the earthwork.

3.04 Removals and Overexcavation

All demolition debris should be cleared and removed from the site. Prior to placement of compacted fills, all loose, or compressible soils will need to be removed down to competent ground. We expect these materials to be 1 to 2 feet deep. Removed and/or overexcavated soils may be moisture-conditioned and recompacted as engineered fill, except for soils containing detrimental amounts of organic material or expansion Index (EI) values greater than 20. In addition to the above requirements, overexcavation will need to meet the following criteria for the building pads, concrete flatwork and pavement areas:

- All footing areas for new buildings, both continuous and spread, shall be undercut, moistened, and compacted as necessary to produce soils compacted to a minimum of 90% relative compaction to a depth of 5 feet below the bottom of the footing. Footing areas shall be defined as the area extending from the edge of the footing for a distance of 5 feet, except where existing building footing occur, then these areas should extend up to the existing footings without undermining the existing footing.

- All new footings for existing buildings, both continuous and spread, shall be undercut, moistened, and compacted as necessary to produce soils compacted to a minimum of 90% relative compaction to a depth of 2 feet below the bottom of the footing. Footing areas shall be defined as the area extending from the edge of the footing for a distance of 2 feet, except where existing building footing occur, then these areas should extend up to the existing footings without undermining the existing footing. Specific instances where the above recommendations conflict with existing improvements should be reviewed by the Geotechnical Engineer and recommendations revised accordingly.
- All floor slabs, concrete flatwork and paved areas shall be underlain by a minimum of 24 inches of soil compacted to a minimum of 90% relative compaction.

The exposed soils beneath all overexcavation should be scarified an additional 12 inches, moisture conditioned and compacted to a minimum of 90% relative compaction.

The above recommendations are based on the assumption that soils encountered during field exploration are representative of soils throughout the site. However, there can be unforeseen and unanticipated variations in soils between points of subsurface exploration. Hence, overexcavation depths must be verified, and adjusted if necessary, at the time of grading. The overexcavated materials may be moisture-conditioned and re-compacted as engineered fill.

3.05 Rippability and Rock Disposal

Our exploratory borings were advanced without difficulty and no oversize materials were encountered in our subsurface investigation. Accordingly we expect that all earth materials will be rippable with conventional heavy duty grading equipment and oversized materials are not expected.

3.06 Subdrains

Surface water was not present at the time of our investigation. Groundwater was encountered in borings B-14, B-17, B-21, B-22, B-23, and B-24 at depths of about 15 to 20 feet below the ground surface. However, this is well below the anticipated depths of grading. Consequently, installation of canyon subdrains is not expected to be necessary.

3.07 Permanent Fill and Cut Slopes

Permanent fill and cut slopes, if necessary, should be constructed at inclinations of 2 horizontal to 1 vertical or flatter.

3.08 Faulting

Potential for Future Fault Displacement within the Site

Based on the following lines of evidence, we conclude that the Campus is crossed by a Holocene-active fault as defined of the State of California (movement during the past 11,700 years):

1. Regional geologic maps consistently show the Raymond or Hollywood fault is located through the center of the campus (See Figures 11 and 12 for examples). Specific location of the fault through campus is unknown and a specific fault investigation of the campus or the immediate properties has not previously been done.

Weber (1980) describes the “the trace of the principal fault of the Hollywood fault zone probably lies at the south edge of a topographic prominence on which Irving Junior High School is located; the conjectural fault projected through the swale at the north edge of the prominence may be a secondary fault of the zone”

2. The borings, CPTs and seismic lines indicate a significant change in stratigraphy and perched groundwater between CPT-8 and CPT-9 and Seismic Lines S-2 and S-3. Based upon these changes in stratigraphy, the offset on the fault is between 8 to 20 feet vertically.
3. Specific indications of building or pavement cracks items were not observed. Out of square doors or windows were not observed.
4. The most recent seismic event along the Raymond fault was the 1988 4.9 magnitude Pasadena Earthquake that occurred 6.3 miles east-northeast of the campus.

Due upon the lack of visual distress to the existing buildings, some of which were constructed in 1937, the probability of surface rupture is moderate.

Based on our conclusion that the site is crossed by a Holocene-active fault, a fault setback zone to mitigate the potential for future surface fault rupture within the site is recommended for new construction of 50 feet from the edge of the possible fault zone indicated on Figure 2. Results of the existing structure investigations should be provided to update the conclusions of this report regarding conditions of the existing buildings within the zone.

3.09 Seismic Design Parameters

The potential damaging effects of regional earthquake activity must be considered in the design of structures.

Mapped Design Parameters

Mapped seismic design parameters have been developed in accordance with Section 1613A of the 2022 California Building Code (CBC) using the online ATC Hazards by Location calculator (ASCE 41-17 and ASCE 7-16), a site location based on latitude and longitude, and site characterization as Site Class D based on our geotechnical investigation.

ASCE 41-17 Standard

ASCE 41-17 Standard, BSE-2N and BSE-1N Seismic Parameters

Parameter	Value
Site Location	Latitude = 34.11664 degrees Longitude = -118.24244 degrees
Site Class	Site Class = D Soil Profile Name = Stiff soil

ASCE 7-16, Site-Specific Response Spectra

A site-specific seismic hazard has been performed using the SCEC UGMS MCER Tool available at https://data2.scec.org/ugms-mcerGM-tool_v18.4/report/669 in accordance with the 2022 California Building Code and Section 21 of ASCE 7-16. The methodology and results of the site-specific analysis are presented in Appendix D. The recommended site-specific seismic design parameters are summarized in the table below.

Site Specific Design Parameters

Design Acceleration Parameter	Value (g)
S_{DS}	1.608
S_{D1}	1.096
S_{MS}	2.412
S_{M1}	1.644

The numerical values for the site-specific MCE_R and Design response spectra are provided in the table below.

Period (s)	Site Specific MCER S_a (g)	Site Specific Design Response Spectrum (g)
0.01	1.075	0.717
0.02	1.078	0.719
0.03	1.099	0.733
0.05	1.205	0.803
0.075	1.433	0.955
0.1	1.646	1.097
0.15	1.949	1.299
0.2	2.213	1.476
0.25	2.434	1.623
0.3	2.648	1.765
0.4	2.68	1.786
0.5	2.533	1.688
0.75	2.031	1.354
1	1.633	1.088
1.5	1.096	0.731
2	0.788	0.526
3	0.481	0.321
4	0.324	0.216
5	0.238	0.159
7.5	0.133	0.089
10	0.085	0.057

In addition, the calculated maximum considered earthquake geometric mean peak ground acceleration (MCE_G) is $PGA_M = 0.916g$.

3.10 Liquefaction and Secondary Earthquake Hazards

Potential secondary seismic hazards that can affect land development projects include liquefaction, tsunamis, seiches, seismically induced settlement, seismically induced flooding and seismically induced landsliding.

Liquefaction

Liquefaction is a phenomenon where earthquake-induced ground motions increase the pore pressure in saturated, sand-like soils until it is equal to the confining, overburden pressure. When this occurs, the soil can completely lose its shear strength and enter a liquefied state. The possibility of liquefaction is dependent upon grain size, relative density, confining pressure, saturation of the soils, and intensity and duration of ground shaking. In order for liquefaction to occur, three criteria must be met: underlying loose, sand-like soils, a groundwater depth of less than about 50 feet, and a potential for seismic ground motions from nearby large-magnitude earthquakes.

According to the California Geological Survey Seismic Hazard Zone Map for the Los Angeles Quadrangle (Figure 10), the site is not within a potential liquefaction hazard zone.

Calculations of liquefaction potential are presented in Appendix E. We evaluated liquefaction triggering for a $PGA_M = 0.916g$, a Magnitude $M_w = 6.9$ (Appendix E), and a depth to ground water table of 25 feet. We used the soil information from our borings B-6, B-14, B-17, B-21, B-22, B-23, and B-24. We used the procedure by Youd et al. (2001) as implemented by the commercially available computer program LiquefyPro 5.8n (CivilTech 2012). Our evaluation suggests that the sand soil layer below the ground water table may be potentially liquefiable. The other soil layers are clay-like soils with PI greater than 7 (Idriss and Boulanger, 2008). Considering that the depth to ground water table for the liquefaction evaluation was 25 feet, no ground surface manifestations of liquefaction are expected to occur.

Tsunamis and Seiches

Tsunamis are sea waves that are generated in response to large-magnitude earthquakes. When these waves reach shorelines, they sometimes produce coastal flooding. Seiches are the oscillation of large bodies of standing water, such as lakes, that can occur in response to ground shaking. Tsunamis and seiches do not pose hazards due to the inland location of the site and lack of nearby bodies of standing water.

Seismically Induced Settlement

Seismically induced settlement occurs most frequently in areas underlain by loose, granular sediments. Damage as a result of seismically induced settlement is most dramatic when differential settlement occurs in areas with large variations in the thickness of underlying sediments. Settlement caused by ground shaking is often non-uniformly distributed, which can result in differential settlement.

Seismic settlement was evaluated for the same ground motions used for liquefaction evaluation. Seismic settlements were estimated using an empirical method developed by Tokimatsu and Seed (1987) based on site-specific SPT blow count and grain size data obtained from our borings. We estimate that the total seismically induced ground settlement that may occur at the site is less than $\frac{1}{2}$ " and differential seismic settlement over a 30 feet horizontal distance is $\frac{1}{4}$ ". Calculations of seismically induced settlements are presented in Appendix E.

Seismically Induced Flooding

According to the Plate 6 of the 1990 Technical Appendix to the Safety Element of the Los Angeles County General Plan (Flood and Inundation Hazards), the site is not located in the potential dam inundation area. In addition, there are no up gradient water reservoirs or dams located in close proximity of the site. Consequently seismically induced flooding at the site is unlikely.

Seismically Induced Landsliding

According to the California Geological Survey Seismic Hazard Zone Map for the Los Angeles Quadrangle (1999), the school is not located within a potential earthquake-induced landslide hazard zone (Figure 10). Additionally, the proposed construction area is not located within or immediately downslope of this area. Considering this, the potential for seismically induced landsliding within the proposed construction site is judged to be very low to nil.

3.11 Foundations

If the recommendations in the section on grading are followed and footings are established in compacted fill materials with an expansion index, EI, of less than 20, footings may be designed using the following allowable soil bearing values:

- Continuous Wall Footings:

Footings having a minimum width of 12 inches and a minimum depth of 18 inches below the lowest adjacent grade have allowable bearing capacity of 1,500 pounds per square foot (psf). This value may be increased by 8% for each additional foot of width and/or depth to a maximum value of 3,000 psf.

- Isolated Spread Footings:

Footings having a minimum width of 12 inches and a minimum depth of 18 inches below the lowest adjacent grade have allowable bearing capacity of 1,500 psf. This value may be increased by 8% for each additional foot of width or depth to a maximum value of 3,000 psf.

- Retaining Wall Footings:

Footings for retaining walls should be founded a minimum depth of 12 inches and have a minimum width of 12 inches. Footings may be designed using the allowable bearing capacity and lateral resistance values recommended for building footings. However, when calculating passive resistance, the upper 6 inches of the footings should be ignored in areas where the footings will not be covered with concrete flatwork. This value may also be increased by 8% for each additional foot of width or depth to a maximum value of 3,000 psf. Reinforcement should be provided for structural considerations as determined by the design engineer.

The above bearing capacities represent an allowable net increase in soil pressure over existing soil pressure and may be increased by one-third for short-term wind or seismic loads. The maximum expected settlement of footings designed with the recommended allowable bearing capacity is expected to be on the order of ½ inch with differential settlement on the order of ¼ inch over a horizontal distance of 30 ft.

3.12 Foundation Setbacks from Slopes

Setbacks for footings adjacent to slopes should conform to the requirements of the California Building Code.

Specifically, footings should maintain a horizontal distance or setback between any adjacent slope face and the bottom outer edge of the footing.

For slopes descending away from the foundation, the horizontal distance may be calculated by using $h/3$, where h is the height of the slope. The horizontal setback should not be less than 5 feet, nor need not be greater than 40 feet per the California Building Code. Where structures encroach within the zone of $h/3$ from the top of the slope the setback may be maintained by deepening the foundations. Flatwork and utilities within the zone of $h/3$ from the top of slope may be subject to lateral distortion caused by gradual downslope creep. Walls, fences and landscaping improvements constructed at the top of descending slopes should be designed with consideration of the potential for gradual downslope creep.

For ascending slopes, the horizontal setback required may be calculated by using $h/2$ where h is the height of the slope. The horizontal setback need not be greater than 15 feet per the California Building Code.

3.13 Slabs on Grade

Based upon geotechnical conditions, the use of unreinforced slabs on grade for structures may apply. However, structural design will require reinforcement of the slab. Since specific reinforcement of the slab is based upon structural loading, the specific type and layout of the reinforcement will need to be designed by the structural engineer.

Floor slabs should have a minimum thickness of 4 inches and should be divided into squares or rectangles using weakened plane joints (contraction joints), each with maximum dimensions not exceeding 15 feet. Contraction joints should be made in accordance with American Concrete Institute (ACI) guidelines. If weakened plane joints are not used, then the slabs shall be reinforced with a minimum of 6x6-10/10 welded wire fabric placed at mid-height of the slab, specific reinforcement of the slab will be based upon structural loading of the slab and provided by the structural engineer.

Special care should be taken on floors slabs to be covered with thin-set tile or other inflexible coverings. These areas may be reinforced with 6x6-10/10 welded wire fabric placed at mid-height of the slab, to mitigate drying shrinkage cracks specific reinforcement of the slab will be based upon structural loading of the slab and provided by the structural engineer. Alternatively, inflexible flooring may be installed with unbonded fabric or liners to prevent reflection of slab cracks through the flooring.

A moisture vapor retarder/barrier is recommended beneath all slabs-on-grade that will be covered by moisture-sensitive flooring materials such as vinyl, linoleum, wood, carpet, rubber, rubber-backed carpet, tile, impermeable floor coatings, adhesives, or where moisture-sensitive equipment, products, or environments will exist. We recommend that design and construction of the moisture vapor retarder/barrier conform to Section 1805A of the 2019 California Building Code and pertinent sections of American Concrete Institute (ACI) guidance documents 302.1R-15, 302.2R-06 and 360R-10.

The moisture vapor retarder/barrier should consist of a minimum 10 mils thick polyethylene with a maximum perm rating of 0.3 in accordance with ASTM E1745. Seams in the moisture vapor retarder/barrier should be overlapped no less than 6 inches or in accordance with the manufacturer's recommendations. Joints and penetrations should be sealed with the manufacturer's recommended adhesives, pressure-sensitive tape, or both. The contractor must avoid damaging or puncturing the moisture vapor retarder/barrier and repair any punctures with additional polyethylene properly lapped and sealed.

The moisture vapor retarder/barrier may be placed directly beneath the floor slab with no intermediate granular fill layer. This method of construction will provide improved curing of the slab bottom and will eliminate potential problems caused by water being trapped in a granular fill layer. However, concrete slabs poured directly on a moisture vapor retarder/barrier can experience shrinkage cracking and curling due to differential rates of curing through the thickness of the slab. Therefore, for concrete placed directly on the moisture vapor retarder/barrier, we recommend a maximum water cement ratio of 0.45 and the use of water-reducing admixtures to increase workability and decrease bleeding.

Alternatively, the slabs may be constructed by placing a 4-inch layer of granular soil over the moisture vapor retarder/barrier in accordance with ACI 302.1R-15. Granular fill should consist of clean, fine-graded materials with 10% to 30% passing the No. 100 sieve and free from clay or silt. The granular layer should be uniformly compacted and trimmed to provide the full design thickness of the proposed slab. The granular fill layer should not be left exposed to rain or other sources of water such as wet-grinding, power washing, pipe leaks or other processes, and should be dry at the time of concrete placement. Granular fill layers that become saturated should be removed and replaced prior to concrete placement.

3.14 Miscellaneous Concrete Flatwork

Miscellaneous concrete flatwork and walkways may be designed with a minimum thickness of 4 inches. Large slabs should be reinforced with a minimum of 6x6-10/10 welded wire mesh placed at mid-height in the slab. Control joints should be constructed to create squares or rectangles with a maximum spacing of 15 feet.

Walkways may be constructed with a minimum of 6x6-10/10 welded wire mesh placed at mid-height in the slab. Walkways should be separated from foundations with a thick expansion joint filler. Control joints should be constructed into walkways at a maximum of 5 feet spacing.

Due to the expansive soils at the site we would recommend that the soils beneath and extending 2 feet laterally from the edge of the walkways and other concrete flatwork be removed and replaced to a depth of 12 inches below the bottom of the proposed flatwork or walkways with soil with an expansion index (EI) of less than 20. It should be compacted to a minimum of 90 percent relative compaction. The geotechnical engineer should monitor the compaction of the subgrade soils and perform testing to verify that proper compaction has been obtained.

3.15 Footing Excavation and Slab Preparations

All footing excavations should be observed by the geotechnical consultant to verify that they have been excavated into competent soils. The foundation excavations should be observed prior to the placement of forms, reinforcement steel, or concrete. These excavations should be evenly trimmed and level. Prior to concrete placement, any loose or soft soils should be removed. Excavated soils should not be placed on slab or footing areas unless properly compacted.

Prior to the placement of the moisture barrier and sand, the subgrade soils underlying the slab should be observed by the geotechnical consultant to verify that all under-slab utility trenches have been properly backfilled and compacted, that no loose or soft soils are present, and that the slab subgrade has been properly compacted to a minimum of 90 percent relative compaction within the upper 24 inches.

Footings may experience and overall loss in bearing capacity or an increased potential to settle where located in

close proximity to existing or future utility trenches. Furthermore, stresses imposed by the footings on the utility lines may cause cracking, collapse and/or a loss of serviceability. To reduce this risk, footings should extend below a 1:1 plane projected upward from the closest bottom of the trench.

Slabs on grade and walkways should be brought to a minimum of 2% and a maximum of 6% above their optimum moisture content for a depth of 18 inches prior to the placement of concrete. The geotechnical consultant should perform insitu moisture tests to verify that the appropriate moisture content has been achieved a maximum of 24 hours prior to the placement of concrete or moisture barriers.

3.16 Lateral Load Resistance

Lateral loads may be resisted by soil friction and the passive resistance of the soil. The following parameters are recommended.

- Passive Earth Pressure = 350 pcf (equivalent fluid weight) (FS=1.0).
- Coefficient of Friction (soil to footing) = 0.35
- Retaining structures should be designed to resist the following lateral active earth pressures:

Surface Slope of Retained Materials (Horizontal:Vertical)	Equivalent Fluid Weight (pcf)
Level	43
5:1	46
4:1	48
3:1	52
2:1	73

These active earth pressures are only applicable if the retained earth is allowed to strain sufficiently to achieve the active state. The required minimum horizontal strain to achieve the active state is approximately 0.0025H. Retaining structures should be designed to resist an at-rest lateral earth pressure if this horizontal strain cannot be achieved.

- At-rest Lateral Earth Pressure = 64 pcf (equivalent fluid weight)

Sliding pressure is developed at the base based on the friction. No reduction is recommended, if they would like to do it, sliding could be reduced by 1/3.

The Mononobe-Okabe method is commonly utilized for determining seismically induced active and passive lateral earth pressures and is based on the limit equilibrium Coulomb theory for static stress conditions. This method entails three fundamental assumptions (e.g., Seed and Whitman, 1970): Wall movement is sufficient to ensure either active or passive conditions, the driving soil wedge inducing the lateral earth pressures is formed by a planar failure surface starting at the heel of the wall and extending to the free surface of the backfill, and the driving soil wedge and the retaining structure act as rigid bodies, and therefore, experiences uniform

accelerations throughout the respective bodies (U.S. Army Corps of Engineers, 2003, Engineering and Design - Stability Analysis of Concrete Structures).

- Seismic Lateral Earth Pressure (allowable) = 32 pcf (equivalent fluid weight).

The seismic lateral earth pressure given above is a triangle increasing with depth, and the resultant of this pressure is an increment of force which should be applied to the back of the wall at 1/3 of the wall height from the wall base. The seismic increment of earth pressure should be added to the static active earth pressure. Even for the at-rest (K_0) condition, the seismic increment of earth pressure should be added to the static active earth pressure, not to the at-rest static earth pressure (SEAOC Seismology Committee 2019).

Per 2019 CBC Section 1803.5.12 dynamic seismic lateral earth pressures shall be applied to foundation walls and retaining walls supporting more than 6 feet of backfill. Dynamic seismic lateral earth pressures may also be applied to shorter walls at the discretion of the structural engineer.

3.17 Drainage and Moisture Proofing

Surface drainage should be directed away from the proposed structure into suitable drainage devices. Neither excess irrigation nor rainwater should be allowed to collect or pond against building foundations or within low-lying or level areas of the lot. Surface waters should be diverted away from the tops of slopes and prevented from draining over the top of slopes and down the slope face.

Walls and portions thereof that retain soil and enclose interior spaces and floors below grade should be waterproofed and dampproofed in accordance with CBC Section 1805A.

Retaining structures should be drained to prevent the accumulation of subsurface water behind the walls. Backdrains should be installed behind all retaining walls exceeding 3 feet in height. A typical detail for retaining wall back drains is presented in Appendix C. All backdrains should be outlet to suitable drainage devices. Retaining wall less than 3 feet in height should be provided with backdrains or weep holes. Dampproofing and/or waterproofing should also be provided on all retaining walls exceeding 3 feet in height.

3.18 Cement Type and Corrosion Potential

Soluble sulfate tests indicate that concrete at the subject site will have a moderate corrosive exposure to water-soluble sulfate in the soil. Our recommendations for concrete exposed to sulfate-containing soils are presented in the table below.

Recommendations for Concrete exposed to Sulfate-containing Soils

Sulfate Exposure	Water Soluble Sulfate (SO ₄) in Soil (% by Weight)	Sulfate (SO ₄) in Water (ppm)	Cement Type (ASTM C150)	Maximum Water-Cement Ratio (by Weight)	Minimum Compressive Strength (psi)
Negligible	0.00 - 0.10	0-150	--	--	2,500
Moderate	0.10 - 0.20	150-1,500	II	0.50	4,000
Severe	0.20 - 2.00	1,500-10,000	V	0.45	4,500
Very Severe	Over 2.00	Over 10,000	V plus pozzolan or slag	0.45	4,500

Use of alternate combinations of cementitious materials may be permitted if the combinations meet design recommendations contained in American Concrete Institute guideline ACI 318-11.

The soils were also tested for soil reactivity (pH) and electrical resistivity (ohm-cm). The test results indicate that the on-site soils have a soil reactivity of 7.3, an electrical resistivity of 1,800 ohm-cm and a chloride content of 32 ppm. A neutral or non-corrosive soil has a soil reactivity ranging from 5.5 to 8.4. Generally, soils that could be considered moderately corrosive to ferrous metals have resistivity values of about 3,000 ohm-cm to 10,000 ohm-cm. Soils with resistivity values less than 3,000 ohm-cm can be considered corrosive and soils with resistivity values less than 1,000 ohm-cm can be considered extremely corrosive. Chloride contents of approximately 500 ppm or greater are generally considered corrosive.

Based on our preliminary analysis, it appears that the underlying onsite soils are corrosive to ferrous metals. Protection of buried pipes utilizing coatings on all underground pipes; clean backfills and a cathodic protection system can be effective in controlling corrosion. At a minimum all ferrous pipes should be coated or wrapped and all pipes shall be bedded in clean sand and designed by the project design professional for utilities. As RMA Group, Inc. does not practice corrosion engineering, a qualified corrosion engineer may be consulted to further assess the corrosive properties of the soil and design of a cathodic protection system.

3.19 Temporary Slopes

Excavation of utility trenches will require either temporary sloped excavations or shoring. Temporary excavations in existing alluvial soils may be safely made at an inclination of 1:1 or flatter. If vertical sidewalls are required in excavations greater than 5 feet in depth, the use of cantilevered or braced shoring is recommended. Excavations less than 5 feet in depth may be constructed with vertical sidewalls without shoring or shielding. Our recommendations for lateral earth pressures to be used in the design of cantilevered and/or braced shoring are presented below. These values incorporate a uniform lateral pressure of 72 psf to provide for the normal construction loads imposed by vehicles, equipment, materials, and workmen on the surface adjacent to the trench excavation. However, if vehicles, equipment, materials, etc., are kept a minimum distance equal to the height of the excavation away from the edge of the excavation, this surcharge load need not be applied.

SHORING DESIGN: LATERAL SHORING PRESSURES

Design of the shield struts should be based on a value of 0.65 times the indicated pressure, P_a , for the approximate trench depth. The wales and sheeting can be designed for a value of 2/3 the design strut value.

HEIGHT OF SHIELD, H_{sh} = DEPTH OF TRENCH, D_t , MINUS DEPTH OF SLOPE, H_1

TYPICAL SHORING DETAIL

Placement of the shield may be made after the excavation is completed or driven down as the material is excavated from inside of the shield. If placed after the excavation, some overexcavation may be required to allow for the shield width and advancement of the shield. The shield may be placed at either the top or the bottom of the pipe zone. Due to the anticipated thinness of the shield walls, removal of the shield after construction should have negligible effects on the load factor of pipes. Shields may be successively placed with conventional trenching equipment.

Vehicles, equipment, materials, etc. should be set back away from the edge of temporary excavations a minimum distance of 15 feet from the top edge of the excavation. Surface waters should be diverted away from temporary excavations and prevented from draining over the top of the excavation and down the slope face. During periods of heavy rain, the slope face should be protected with sandbags to prevent drainage over the

edge of the slope, and a visqueen liner placed on the slope face to prevent erosion of the slope face.

Periodic observations of the excavations should be made by the geotechnical consultant to verify that the soil conditions have not varied from those anticipated and to monitor the overall condition of the temporary excavations over time. If at any time during construction conditions are encountered which differ from those anticipated, the geotechnical consultant should be contacted and allowed to analyze the field conditions prior to commencing work within the excavation.

Cal/OSHA construction safety orders should be observed during all underground work.

3.20 Utility Trench Backfill

The onsite fill soils will not be suitable for use as pipe bedding for buried utilities. All pipes should be bedded in a sand, gravel or crushed aggregate imported material complying with the requirements of the Standard Specifications for Public Works Construction Section 306-1.2.1. Crushed rock products that do not contain appreciable fines should not be utilized as pipe bedding and/or backfill. Bedding materials should be densified to at least 90% relative compaction (ASTM D1557) by mechanical methods. The geotechnical consultant should review and approve of proposed bedding materials prior to use.

All utility trench backfill within street right of way, utility easements, under or adjacent to sidewalks, driveways, or building pads should be observed and tested by the geotechnical consultant to verify proper compaction. Trenches excavated adjacent to foundations should not extend within the footing influence zone defined as the area within a line projected at a 1:1 drawn from the bottom edge of the footing. Trenches crossing perpendicular to foundations should be excavated and backfilled prior to the construction of the foundations. The excavations should be backfilled in the presence of the geotechnical engineer and tested to verify adequate compaction beneath the proposed footing.

Cal/OSHA construction safety orders should be observed during all underground work.

3.21 Pavement Sections

Asphalt Pavement

Two R-value tests were performed on the anticipated subgrade soil at the site in order to provide information on their soil properties for design of pavement structural sections. The R-value test was done in compliance with CTM-301. In the course of running the test the sample was unable to be compacted at the pressure required by the test method without extruding around the mold, therefore, in accordance with the test methods an R-value of 12 and 9 was assumed to the soil. Structural sections were designed using the procedures outlined in Chapter 630 of the California Highway Design Manual (Caltrans, 2017). This procedure uses the principle that the pavement structural section must be of adequate thickness to distribute the load from the design traffic index (TI) to the subgrade soils in such a manner that the stresses from the applied loads do not exceed the strength of the soil (R-value).

Per the proposal, we have provided alternate structural sections for traffic indexes 3, 4, 5, 6, and 7. Selection of the final pavement structural section should be based on economic considerations which are beyond the scope of this investigation. Recommended structural sections using the R-value of 9 are as follows:

Traffic Index	3	4	5	6	7
Pavement Section with Base	3.0" AC 6.0" Base	4.5" AC 6.0 Base6	5.5" AC 6.0" Base	7.5" AC 6.0" Base	9.0" AC 6.0" Base
Full Depth Section	4.5"	6.0"	7.0"	9.5"	12"

Prior to paving, the subgrade soils should be scarified and the moisture adjusted to within 2% of the optimum moisture content. The subgrade soils should be compacted to a minimum of 90% relative compaction if overlain by aggregate base or 95% relative compaction if base is not used. All aggregate base courses should be compacted to a minimum of 95% relative compaction.

PCC Pavement

Portland cement concrete (PCC) pavements for areas which are not subject to traffic loads may be designed with a minimum thickness of 4.0 inches of Portland cement concrete on compacted native soils with a minimum of 6x6-10/10 welded wire mesh placed at mid-height in the slab (see Section 3.14 for more information for construction of non-vehicular concrete pavements).

If light traffic loads such as car parking and access areas are anticipated, PCC pavements should be designed for a minimum thickness of 5.0 inches of Portland cement concrete on 5.0 inches of crushed aggregate base. A minimum of number 4 reinforcing steel placed 24 inches on center placed at mid-height in the slab may be placed to limit cracking. Control joints should be constructed into the pavement at a maximum of 12.5 feet spacing.

For heavier traffic loads such as bus aisles delivery and trash truck lanes, PCC pavements should be designed for a minimum thickness of 6.0 inches of Portland cement concrete on 6.0 inches of crushed aggregate base. A minimum of number 4 reinforcing steel placed 24 inches on center placed at mid-height in the slab may be placed to limit cracking. Control joints should be constructed into the pavement at a maximum of 15 feet spacing.

Prior to paving, the subgrade soils should be scarified and the moisture adjusted to within 2% of the optimum moisture content. The subgrade soils should be compacted to a minimum of 90% relative compaction if overlain by aggregate base. All aggregate base courses should be compacted to a minimum of 95% relative compaction.

3.22 Infiltration Assessment

Based upon the near surface stiff to hard clay soils, we would anticipate very low infiltration rates at the site, probably below 0.1 minutes/inch. We would not recommend infiltration of stormwater at the site.

3.23 Plan Review

Once a formal grading and foundation plans are prepared for the subject property, this office should review the plans from a geotechnical viewpoint, comment on changes from the plan used during preparation of this report and revise the recommendations of this report where necessary.

3.24 Geotechnical Observation and Testing During Rough Grading

The geotechnical engineer should be contacted to provide observation and testing during the following stages of grading:

- During the clearing and grubbing of the site.
- During the demolition of any existing structures, buried utilities or other existing improvements.
- During excavation and overexcavation of compressible soils.
- During all phases of grading including ground preparation and filling operations.
- When any unusual conditions are encountered during grading.

A final geotechnical report summarizing conditions encountered during grading should be submitted upon completion of the rough grading operations.

3.25 Post-Grading Geotechnical Observation and Testing

After the completion of grading the geotechnical engineer should be contacted to provide additional observation and testing during the following construction activities:

- During trenching and backfilling operations of buried improvements and utilities to verify proper backfill and compaction of the utility trenches.
- After excavation and prior to placement of reinforcing steel or concrete within footing trenches to verify that footings are properly founded in competent materials.
- During fine or precise grading involving the placement of any fills underlying driveways, sidewalks, walkways, or other miscellaneous concrete flatwork to verify proper placement, mixing and compaction of fills.
- When any unusual conditions are encountered during construction.

4.00 CLOSURE

The findings, conclusions and recommendations in this report were prepared in accordance with generally accepted engineering and geologic principles and practices. No other warranty, either expressed or implied, is made. This report has been prepared for Los Angeles Unified School District to be used solely for design purposes. Anyone using this report for any other purpose must draw their own conclusions regarding required construction procedures and subsurface conditions.

The geotechnical and geologic consultant should be retained during the earthwork and foundation phases of construction to monitor compliance with the design concepts and recommendations and to provide additional recommendations as needed. Should subsurface conditions be encountered during construction that are different from those described in this report, this office should be notified immediately so that our recommendations may be re-evaluated.

SEISMIC HAZARD ZONE MAP

ALQUIST-PRIOLO EARTHQUAKE FAULT ZONES

Earthquake Fault Zones

Zone boundaries are delineated by straight-line segments; the boundaries define the zone encompassing active faults that constitute a potential hazard to structures from surface faulting or fault creep such that avoidance as described in Public Resources Code Section 2621.5(a) would be required.

Active Fault Traces

Faults considered to have been active during Holocene time and to have potential for surface rupture: Solid Line in Black or Red where Accurately Located; Long Dash in Black or Solid Line in Purple where Approximately Located; Short Dash in Black or Solid Line in Orange where Inferred; Dotted Line in Black or Solid Line in Rose where Concealed; Query (?) indicates additional uncertainty. Evidence of historic offset indicated by year of earthquake-associated event or C for displacement caused by fault creep.

Scale: 1" = 2,500'
(2017)

SEISMIC HAZARD ZONES

Liquefaction Zones

Areas where historical occurrence of liquefaction, or local geological, geotechnical and ground water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

Earthquake-Induced Landslide Zones

Areas where previous occurrence of landslide movement, or local topographic, geological, geotechnical and subsurface water conditions indicate a potential for permanent ground displacements such that mitigation as defined in Public Resources Code Section 2693(c) would be required.

OVERLAPPING ALQUIST-PRIOLO AND SEISMIC HAZARD ZONES

Overlap of Earthquake Fault Zone and Liquefaction Zone

Areas that are covered by both Earthquake Fault Zone and Liquefaction Zone.

Overlap of Earthquake Fault Zone and Earthquake-Induced Landslide Zone

Areas that are covered by both Earthquake Fault Zone and Earthquake-Induced Landslide Zone.

Notes:

Earthquake data: U.S.G.S. P.P. 1515 & online data, Southern California Earthquake Center & California Geological Survey online data

Magnitudes prior to 1932 are estimated from intensity.

Magnitudes after 1932 are moment, local or surface wave magnitudes.

Site Location:

Site Longitude: - 118.24244

Site Latitude: 34.11664

APPENDIX A
FIELD INVESTIGATION

APPENDIX A

FIELD INVESTIGATION

A-1.00 FIELD EXPLORATION

A-1.01 Number of Borings

Our subsurface investigation consisted of 8 exploratory borings drilled with a CME-75 rig, 12 CPT Tests, and 4 Seismic lines and 1 boring and 3 CPTs from a prior investigation performed by this office in .

A-1.02 Location of Borings

A Geologic Map showing the approximate locations of the borings is presented as Figure 2.

A-1.03 Boring Logging

Logs of borings were prepared by one of our staff and are attached in this appendix. The logs contain factual information and interpretation of subsurface conditions between samples. The strata indicated on these logs represent the approximate boundary between earth units and the transition may be gradual. The logs show subsurface conditions at the dates and locations indicated, and may not be representative of subsurface conditions at other locations and times.

Identification of the soils encountered during the subsurface exploration was made using the field identification procedure of the Unified Soils Classification System (ASTM D2488). A legend indicating the symbols and definitions used in this classification system and a legend defining the terms used in describing the relative compaction, consistency or firmness of the soil are attached in this appendix. Bag samples of the major earth units were obtained for laboratory inspection and testing, and the in-place density of the various strata encountered in the exploration was determined

PARTICLE SIZE LIMITS		MAJOR DIVISIONS	GROUP SYMBOLS	TYPICAL NAMES		
U.S. STANDARD SIEVE SIZE No. 200 No. 40 No. 10 No. 4 3/4 in. 3 in. 12 in.	BOULDERS	GRAVELS (More than 50% of coarse fraction is LARGER than the No. 4 sieve size.)	 CLEAN GRAVELS (Little or no fines)	GW Well graded gravel, gravel-sand mixtures, little or no fines.		
	COBBLES		 GRAVELS WITH FINES (Appreciable amt. of fines)	GP Poorly graded gravel or gravel-sand mixtures, little or no fines.		
	GRAVEL		(More than 50% of material is LARGER than No. 200 sieve size)	COARSE GRAINED SOILS	 CLEAN SANDS (Little or no fines)	GM Silty gravels, gravel-sand-silt mixtures.
					 SANDS WITH FINES (Appreciable amount of fines)	GC Clayey gravels, gravel-sand-clay mixtures.
	SAND		(More than 50% of coarse fraction is SMALLER than the No. 4 sieve size)	SANDS	 CLEAN SANDS (Little or no fines)	SW Well graded sands, gravelly sands, little or no fines.
					 SANDS WITH FINES (Appreciable amount of fines)	SP Poorly graded sands or gravelly sands, little or no fines.
	FINE	(More than 50% of material is SMALLER than No. 200 sieve size)	FINE GRAINED SOILS	 SILTS AND CLAYS (Liquid limit LESS than 50)	SM Silty sands, sand-silt mixtures.	
				 SILTS AND CLAYS (Liquid limit GREATER than 50)	SC Clayey sands, sand-clay mixtures.	
	SILT OR CLAY	(More than 50% of material is SMALLER than No. 200 sieve size)	FINE GRAINED SOILS	 SILTS AND CLAYS (Liquid limit LESS than 50)	ML Inorganic silts and very fine sands, rock flour silty or clayey fine sands or clayey silts with slight plasticity	
				 SILTS AND CLAYS (Liquid limit GREATER than 50)	CL Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.	
				 SILTS AND CLAYS (Liquid limit GREATER than 50)	OL Organic silts and organic silty clays of low plasticity.	
				 SILTS AND CLAYS (Liquid limit GREATER than 50)	MH Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts.	
	SILT OR CLAY	(More than 50% of material is SMALLER than No. 200 sieve size)	FINE GRAINED SOILS	 SILTS AND CLAYS (Liquid limit GREATER than 50)	CH Inorganic clays of high plasticity, fat clays.	
				 SILTS AND CLAYS (Liquid limit GREATER than 50)	OH Organic clays of medium to high plasticity, organic silts.	
HIGHLY ORGANIC SOILS		 HIGHLY ORGANIC SOILS	Pt Peat and other highly organic soils.			

BOUNDARY CLASSIFICATIONS: Soils possessing characteristics of two groups are designated by combinations of group symbols.

UNIFIED SOIL CLASSIFICATION SYSTEM

I. SOIL STRENGTH/DENSITY

BASED ON STANDARD PENETRATION TESTS

Apparent Density of sand		Consistency of clay	
Penetration Resistance N (blows/Ft)	Apparent density	Penetration Resistance N (blows/ft)	Consistency
0-4	Very Loose	<2	Very Soft
4-10	Loose	2-4	Soft
10-30	Medium Dense	4-8	Medium Stiff
30-50	Dense	8-15	Stiff
>50	Very Dense	15-30	Very Stiff
		>30	Hard

N = Number of blows of 140 lb. weight falling 30 in. to drive 2-in OD sampler 1 ft.

BASED ON RELATIVE COMPACTION

Compactness of sand		Consistency of clay	
% Compaction	Compactness	% Compaction	Consistency
<75	Loose	<80	Soft
75-83	Medium Dense	80-85	Medium Stiff
83-90	Dense	85-90	Stiff
>90	Very Dense	>90	Very Stiff

II. SOIL MOISTURE

Description	Criteria
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but not visible water
Wet	Visible free water, usually soil is below water table

- CPT Plots
- CPT Classification/Soil Behavior Chart
- Summary of Shear Wave Velocities
- CPT Data Files (sent via email)

SUMMARY OF CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the Irving STEAM Magnet School project located in Los Angeles, California. The work was performed by Kehoe Testing & Engineering (KTE) on November 22, 2021. The scope of work was performed as directed by RMA Group personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at seven locations to determine the soil lithology. A summary is provided in **TABLE 2.1**.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-8	46	Refusal
CPT-9	47	Refusal
CPT-13	50	
CPT-15	50	
CPT-16	50	
CPT-18	50	
CPT-19	50	

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm² cone with a cone net area ratio of 0.83. The following parameters were recorded at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

At location CPT-13, shear wave measurements were obtained at approximately 10-foot intervals. The shear wave is generated using an air-actuated hammer, which is located inside the front jack of the CPT rig. The cone has a triaxial geophone, which recorded the shear wave signal generated by the air hammer.

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil behavior type on the CPT plots is derived from the attached CPT SBT plot (Robertson, "Interpretation of Cone Penetration Test...", 2009) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (q_c), sleeve friction (f_s), and penetration pore pressure (u). The friction ratio (R_f), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

The CPT data files have also been provided. These files can be imported in CPeT-IT (software by GeoLogismiki) and other programs to calculate various geotechnical parameters.

It should be noted that it is not always possible to clearly identify a soil type based on q_c , f_s and u . In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

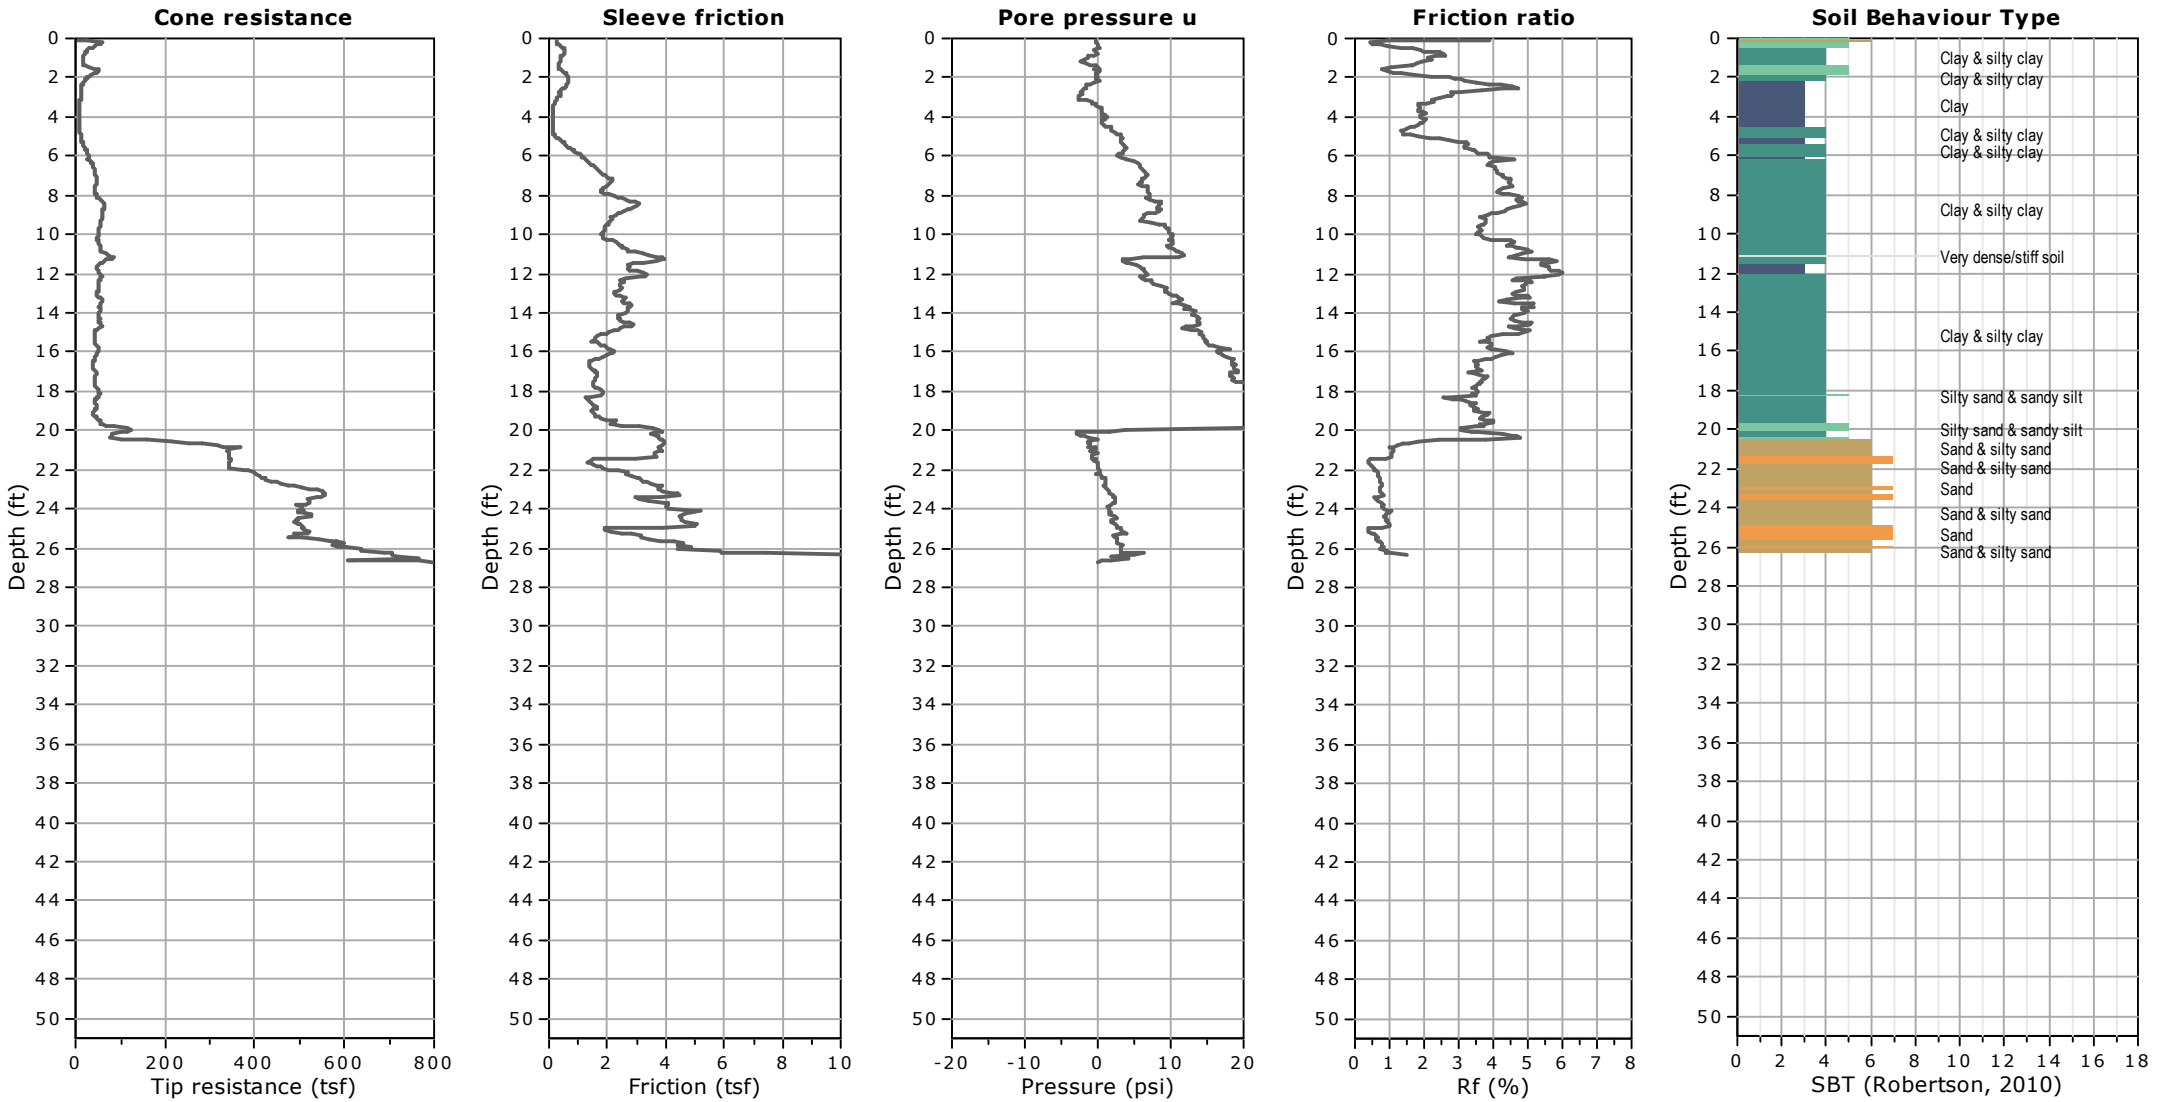

Sincerely,

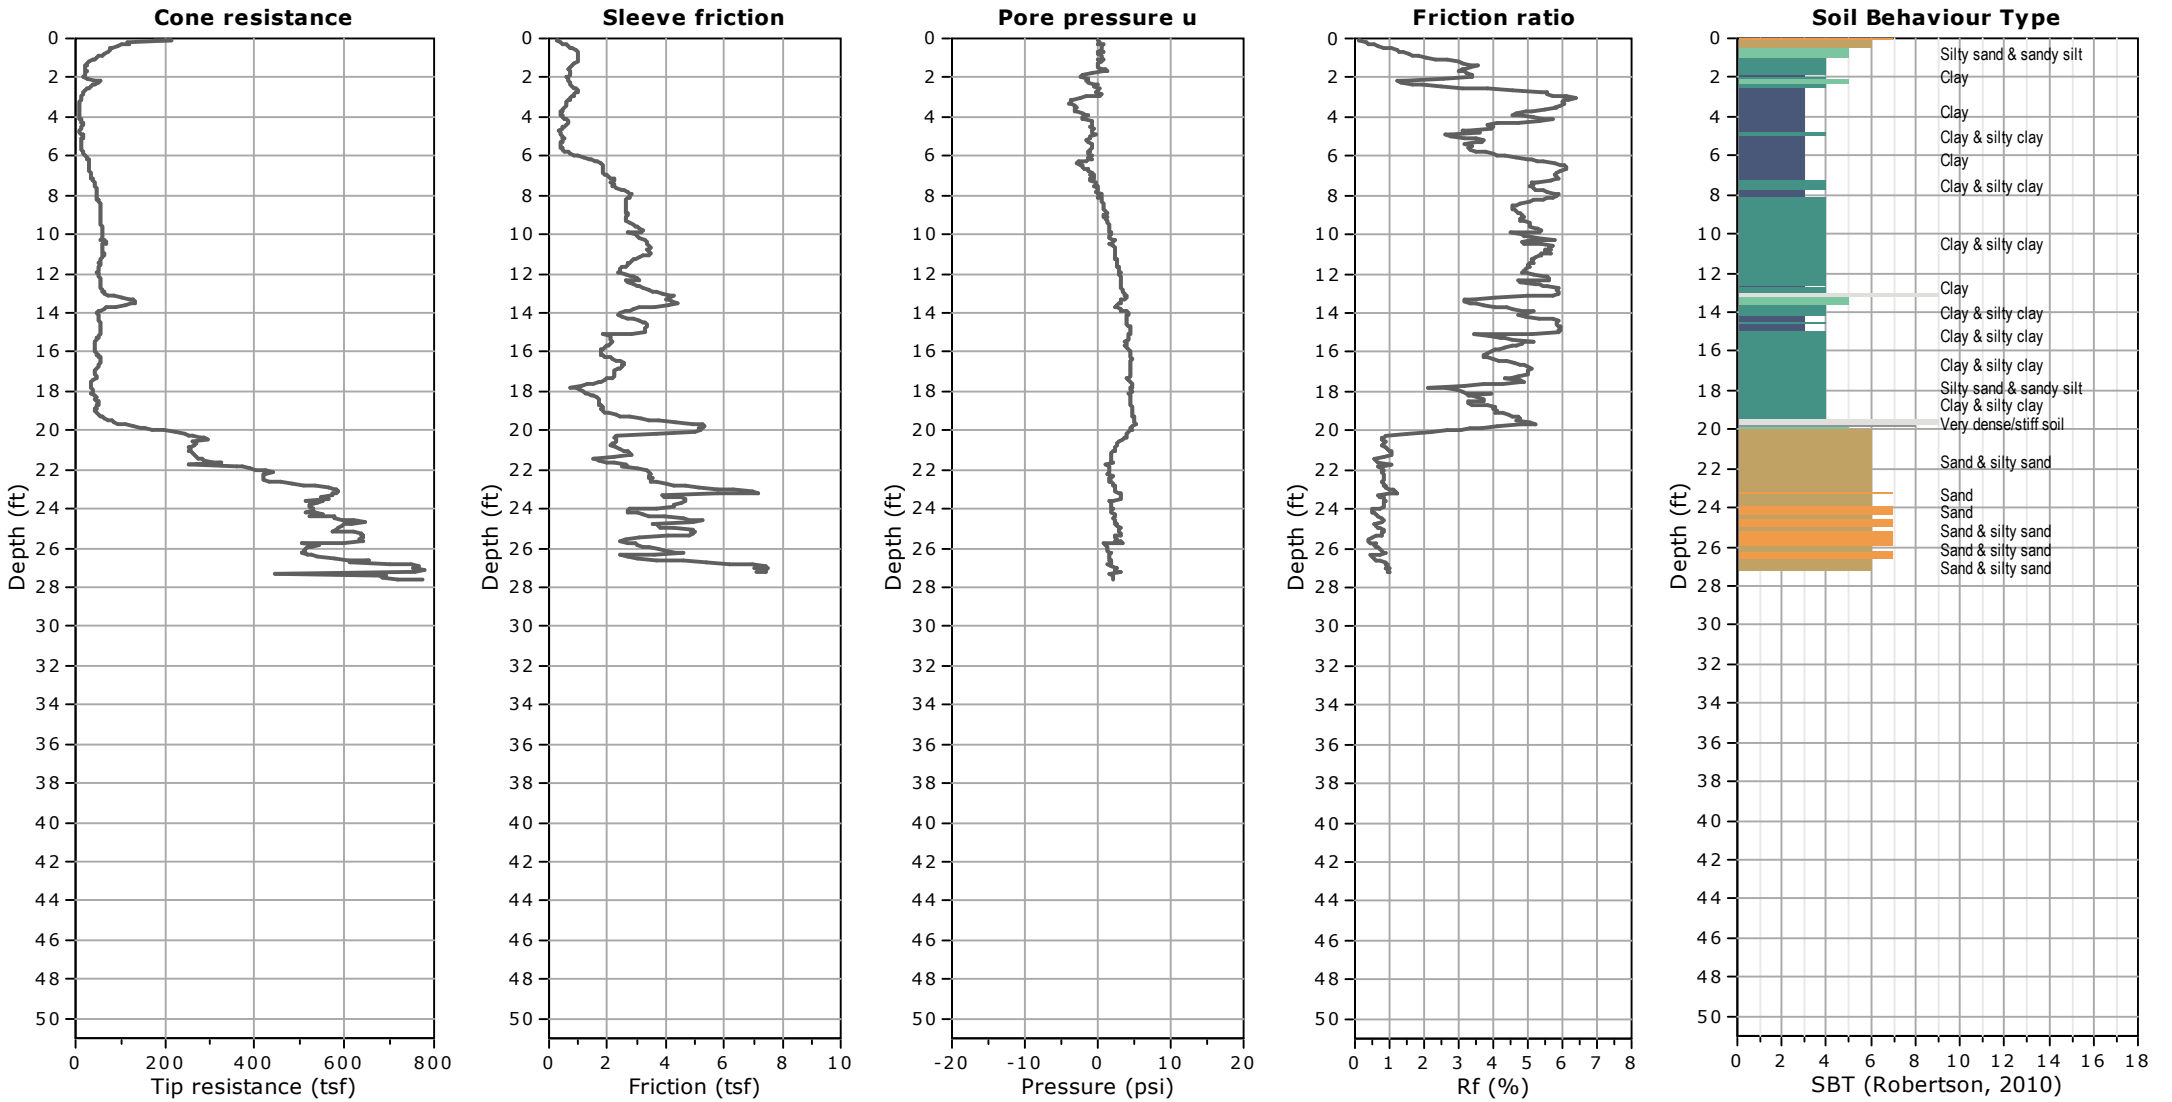

KEHOE TESTING & ENGINEERING

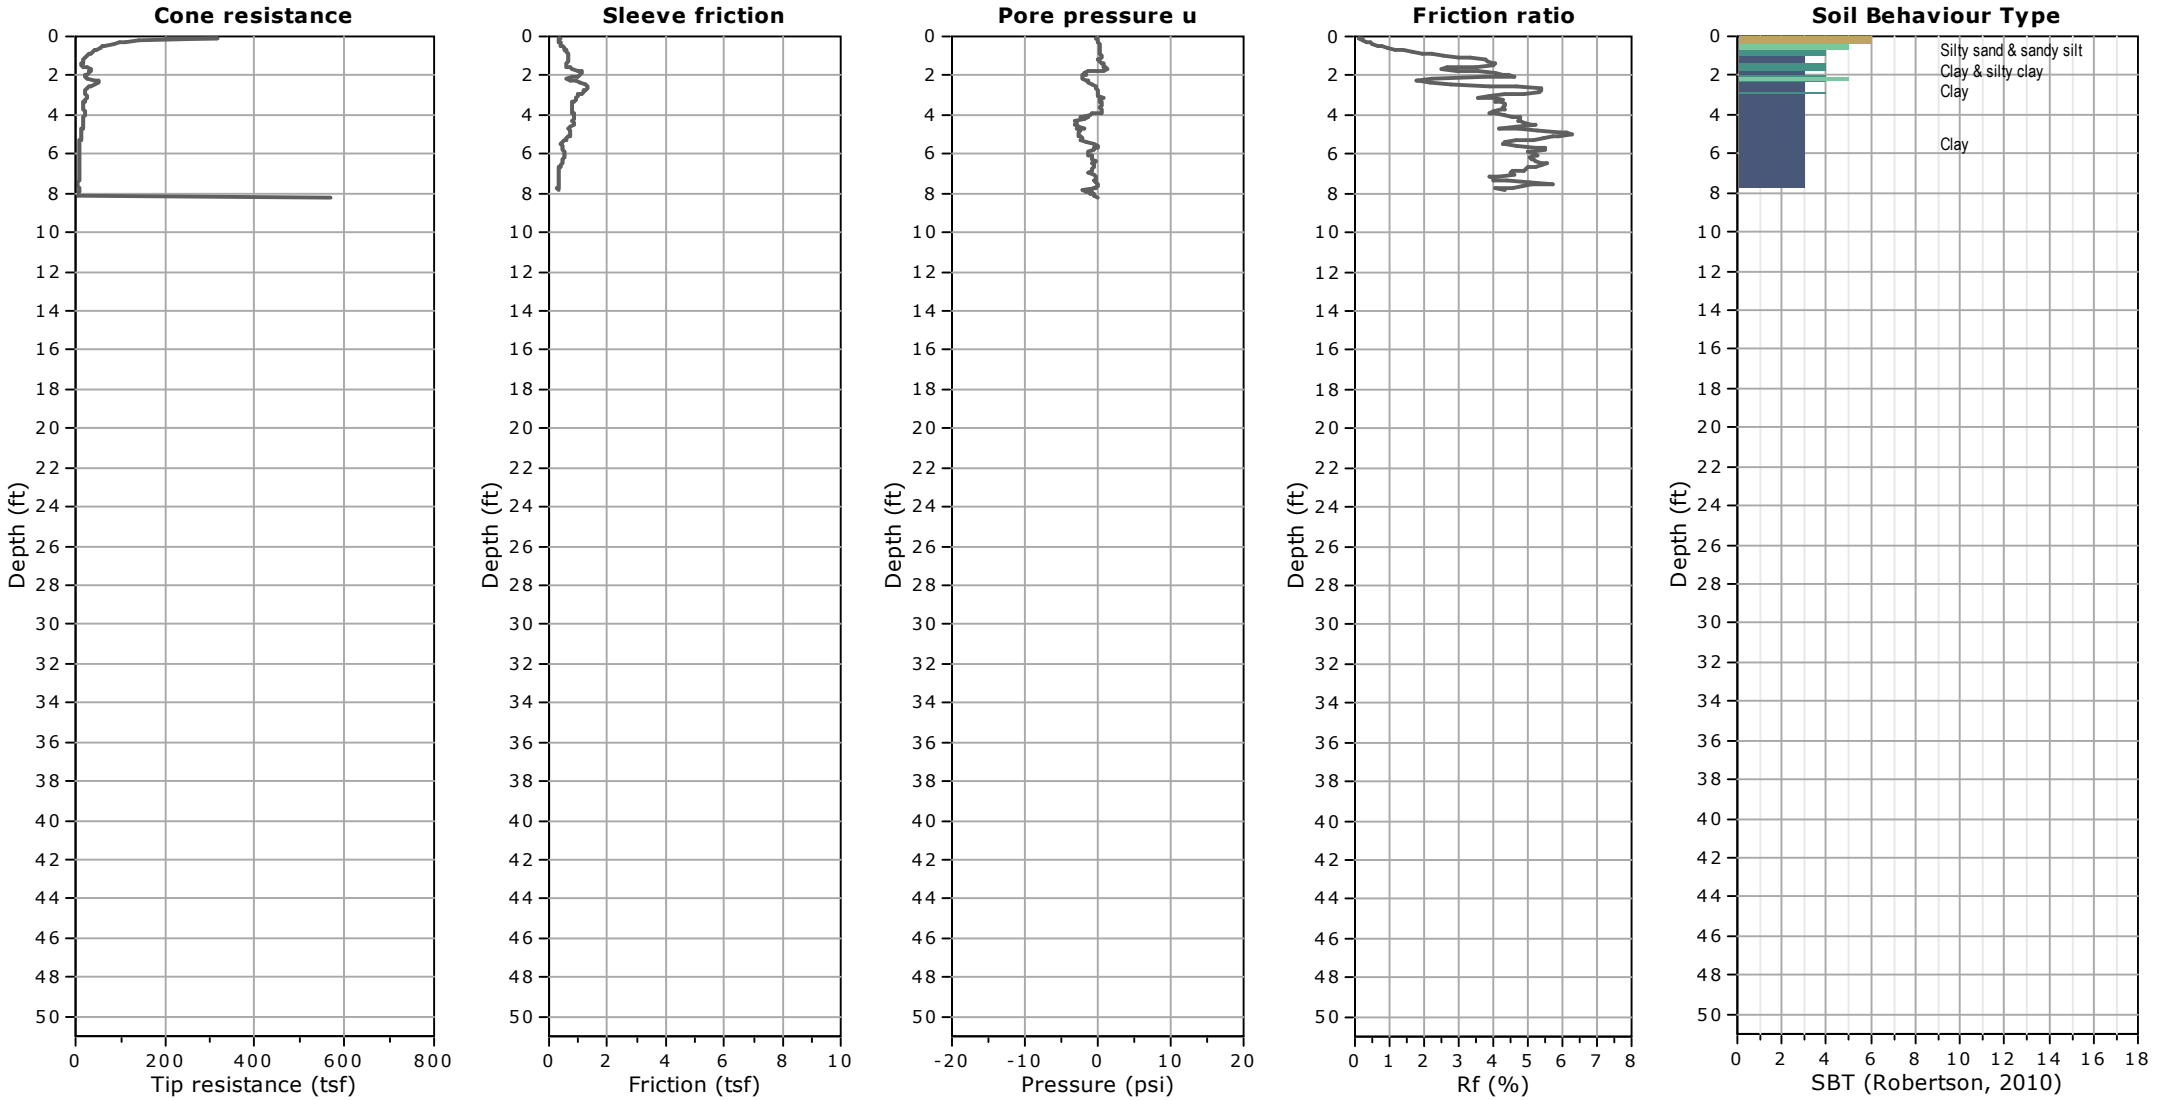

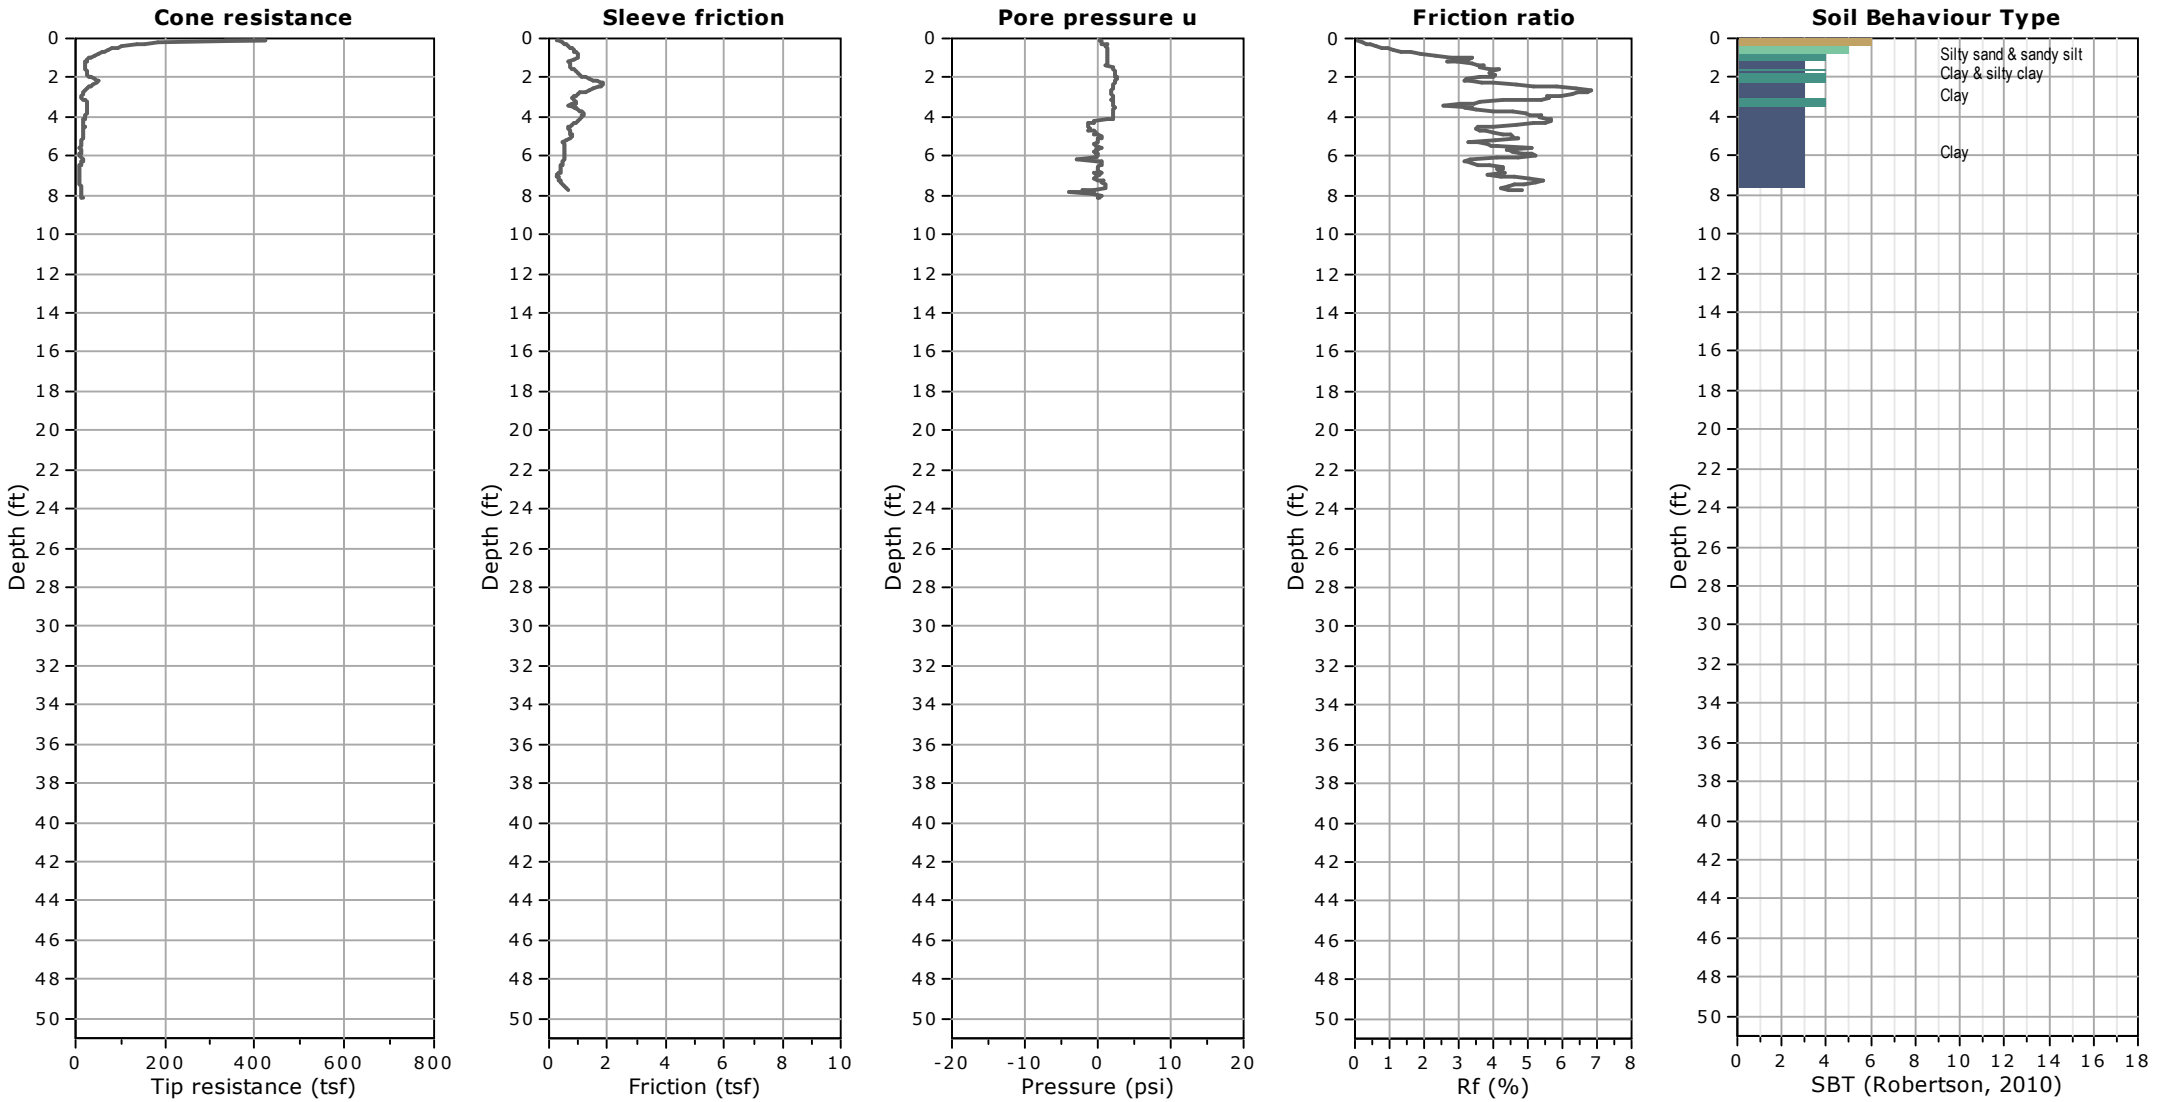

Steven P. Kehoe
President

SUMMARY OF CONE PENETRATION TEST DATA

1. INTRODUCTION

This report presents the results of a Cone Penetration Test (CPT) program carried out for the Irving STEAM Magnet School project located at 3010 Estara Avenue in Los Angeles, California. The work was performed by Kehoe Testing & Engineering (KTE) on October 22, 2018. The scope of work was performed as directed by RMA Group personnel.

2. SUMMARY OF FIELD WORK

The fieldwork consisted of performing CPT soundings at three locations to determine the soil lithology. Groundwater measurements and hole collapse depths provided in **TABLE 2.1** are for information only. The readings indicate the apparent depth to which the hole is open and the apparent water level (if encountered) in the CPT probe hole at the time of measurement upon completion of the CPT. KTE does not warranty the accuracy of the measurements and the reported water levels may not represent the true or stabilized groundwater levels.

LOCATION	DEPTH OF CPT (ft)	COMMENTS/NOTES:
CPT-1	50	Hole open to 17.0 ft (dry)
CPT-2	50	Hole open to 19.5 ft (dry)
CPT-3	49	Refusal, hole open to 49.0 ft (dry)

TABLE 2.1 - Summary of CPT Soundings

3. FIELD EQUIPMENT & PROCEDURES

The CPT soundings were carried out by **KTE** using an integrated electronic cone system manufactured by Vertek. The CPT soundings were performed in accordance with ASTM standards (D5778). The cone penetrometers were pushed using a 30-ton CPT rig. The cone used during the program was a 15 cm² cone and recorded the following parameters at approximately 2.5 cm depth intervals:

- Cone Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (u)
- Inclination
- Penetration Speed

The above parameters were recorded and viewed in real time using a laptop computer. Data is stored at the KTE office for up to 2 years for future analysis and reference. A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

4. CONE PENETRATION TEST DATA & INTERPRETATION

The Cone Penetration Test data is presented in graphical form in the attached Appendix. These plots were generated using the CPeT-IT program. Penetration depths are referenced to ground surface. The soil classification on the CPT plots is derived from the attached CPT Classification Chart (Robertson) and presents major soil lithologic changes. The stratigraphic interpretation is based on relationships between cone resistance (q_c), sleeve friction (f_s), and penetration pore pressure (u). The friction ratio (R_f), which is sleeve friction divided by cone resistance, is a calculated parameter that is used along with cone resistance to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone resistance and generate excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little (or negative) excess pore water pressures.

The CPT data files have also been provided. These files can be imported in CPeT-IT (software by GeoLogismiki) and other programs to calculate various geotechnical parameters.

It should be noted that it is not always possible to clearly identify a soil type based on q_c , f_s and u . In these situations, experience, judgement and an assessment of the pore pressure data should be used to infer the soil behavior type.

If you have any questions regarding this information, please do not hesitate to call our office at (714) 901-7270.

Sincerely,

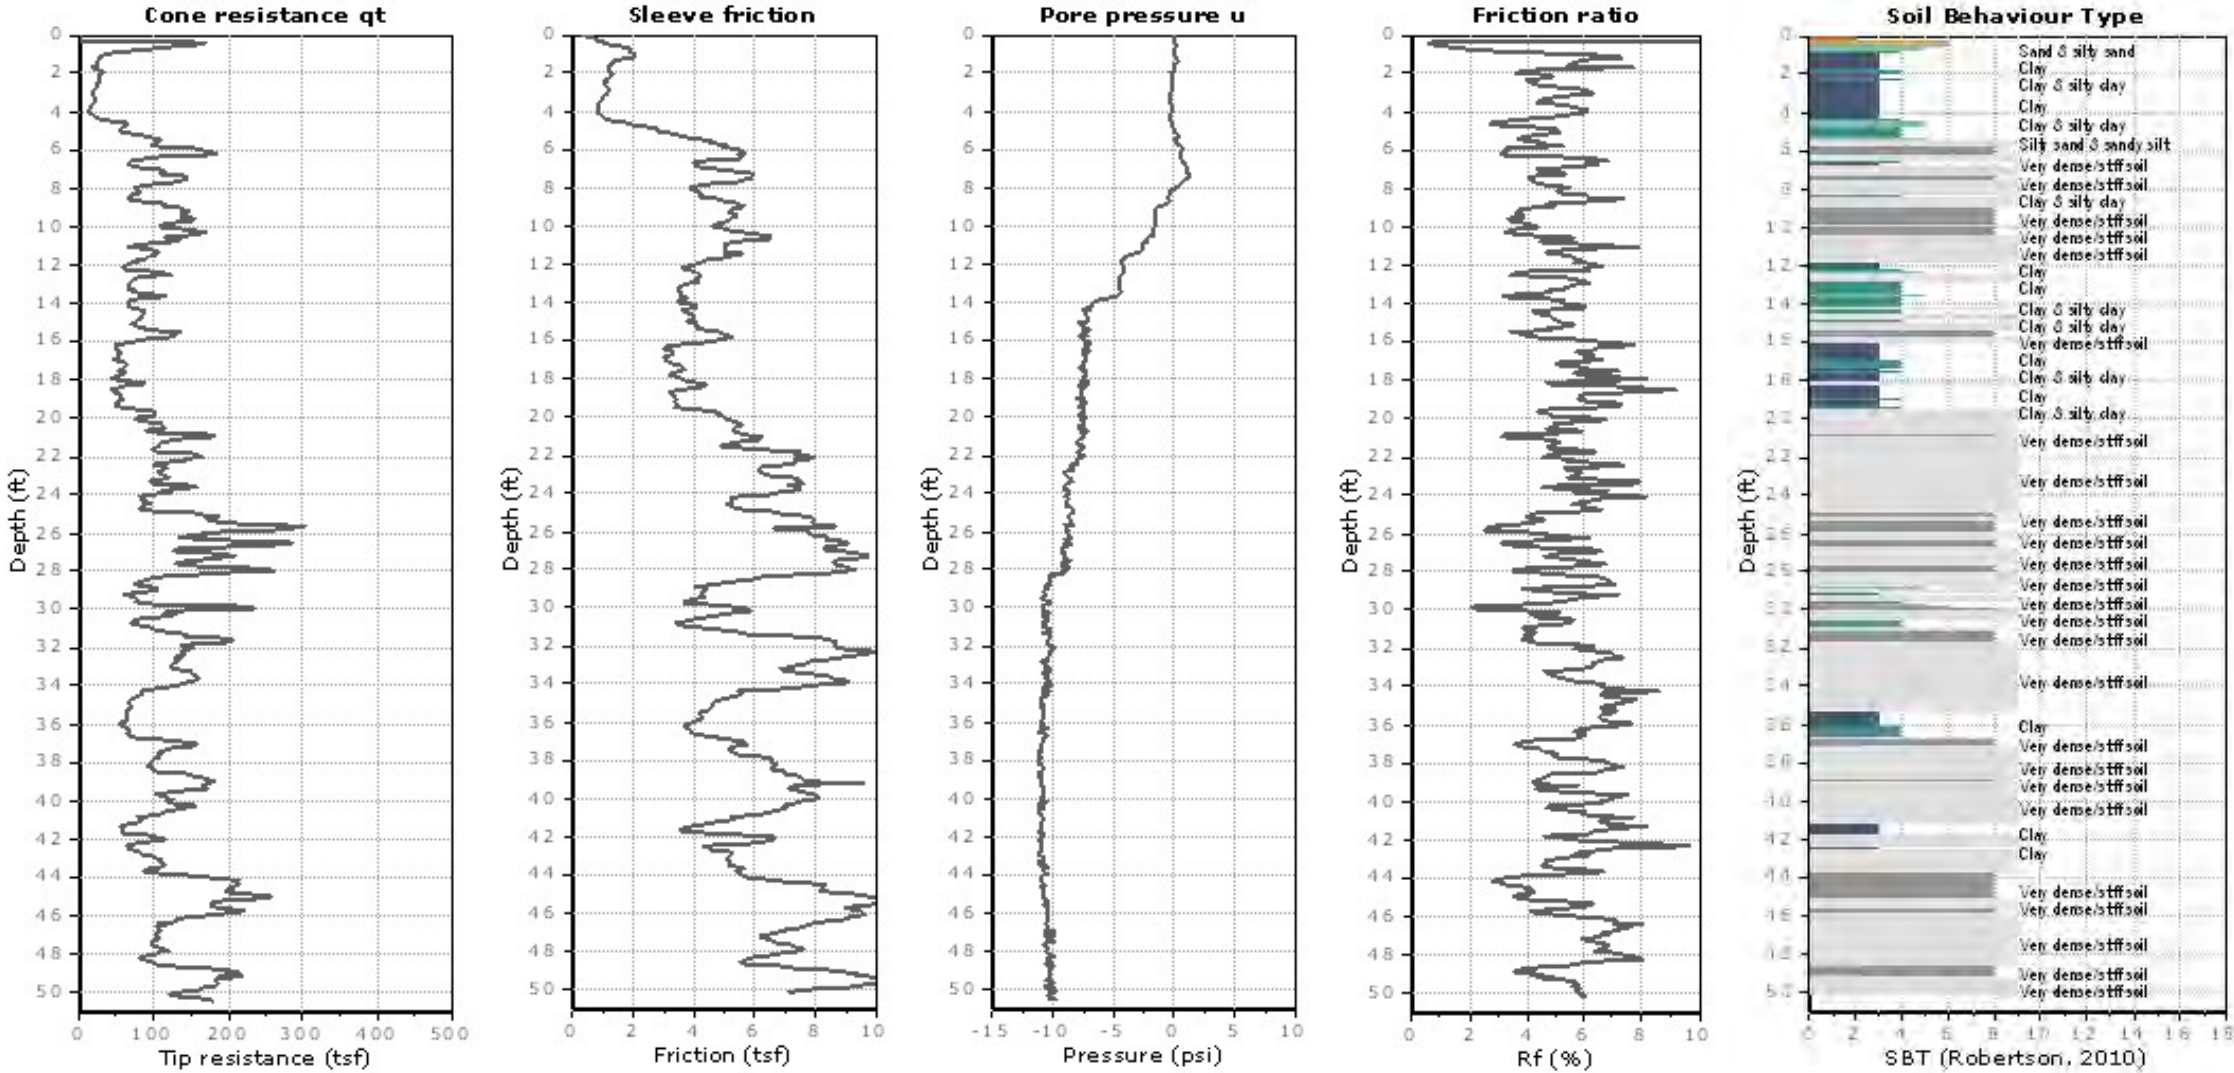

KEHOE TESTING & ENGINEERING

INTRODUCTION

In accordance with your request, we have completed a geophysical survey using the seismic refraction method across portions of the subject site as referenced above. We understand that the subject property is located within the limits of a designated Earthquake Fault Zone associated with the Hollywood Fault Zone, therefore, non-invasive geophysical methods have been utilized to aid in evaluating the deeper subsurface geological structure. This report will describe in detail the seismic refraction methodology, field procedures used, data processing of the various seismic modeling programs utilized, and the results of this survey, along with the representative seismic models being presented within Appendices A and B for visual and reference purposes.

As authorized by you, the following services were performed during this study:

- **Review of available pertinent published and unpublished geologic and geophysical data in our files pertaining to the site, along with a field reconnaissance.**
- **Conducting a geophysical survey, using the seismic refraction method, to aid in evaluating the deeper subsurface lithology and geologic structure present beneath the subject site. The field survey and the data analysis were performed by a licensed State of California Professional Geophysicist.**
- **Preparation of representative seismic models for the seismic traverses displaying the subsurface geologic structure using various computer data analysis programs for both comparative and quality control purposes.**
- **Preparation of this report, presenting the results of our interpretation of the geophysical data with respect to any possible anomalous structural features at depth.**

Accompanying Map and Appendices

- Plate 1 - Seismic Line Location Map
- Appendix A - Layer Velocity Models
- Appendix B - Tomographic Models
- Appendix C - References

PROJECT SUMMARY

As requested, we have performed a geophysical survey using the seismic refraction method across portions of the subject property where practical. The purpose of this geophysical study was to provide both a qualitative and quantified geophysical analysis of the subsurface geologic structure, using the seismic refraction method, in order to discern and any anomalous geologic structures that may be related to faulting beneath the subject site. Our study involved using various seismic refraction computer modeling programs for both quality control and comparative purposes, which allowed for an unbiased and more thorough analysis. Each of these modeling programs, as described in more detail further in this report, have both strengths and limitations and it was our intention to compare these models to form a more coherent representation of the interpreted subsurface geologic structure.

The locations of our seismic traverses were accomplished by use of the Google™ Earth imagery (2021) and physical structures, supplemented with GPS (Global Positioning System) coordinates, as presented on the Seismic Line Location Map, Plate 1. Seismic Line S-4 was performed along a near-perpendicular orientation to the local fault trend within the athletic field, while the other three seismic lines (S-1 through S-3) were performed along the only accessible locations that provided the sufficient survey line length, while being free from physical obstructions, buildings, and hardscape surfaces (i.e., asphalt pavement, concrete, etc.).

From a geologic standpoint, the subject school site has been mapped by Yerkes (1997), to be mantled by Holocene age undifferentiated alluvium (1,000 to 10,000± years old), that is unconsolidated and uncemented, generally comprised of gravel, sand, silt, and clay in active drainages. Localized artificial fill may also be present associated with previous grading of the school site. Presumably underlying these deposits at depth, is sedimentary bedrock of the middle Miocene age Topanga Formation, generally comprised of interbedded sandstone, shale, siltstone, and conglomerate.

SUMMARY OF SEISMIC REFRACTION SURVEY

Methodology

The seismic refraction method is well suited to identify whether there is a distinct velocity change at depth which could represent a possible subsurface structural differential. The seismic refraction method consists of measuring (at known points along the surface of the ground) the travel times of compressional waves generated by an impulsive energy source and can be used to estimate the layering, structure, and seismic acoustic velocities of subsurface horizons. Seismic waves travel down and through the soils and rocks, and when the wave encounters a contact between two earth materials having different velocities, some of the wave's energy travels along the contact at the velocity of the lower layer.

The fundamental assumption is that each successively deeper layer has a velocity greater than the layer immediately above it. As the wave travels along the contact, some of the wave's energy is refracted toward the surface where it is detected by a series of motion-sensitive transducers (geophones). The arrival time of the seismic wave at each of the geophone locations can be related to the relative seismic velocities of the subsurface layers in feet per second (fps), which can then be used to aid in interpreting both the depth and type of materials encountered.

Field Procedures

Four seismic refraction lines were performed (Seismic Line S-1 through S-4) along various portions of the subject school property, where practical. Although the seismic traverses were not surveyed, the locations, as presented on Plate 1, are considered to be fairly accurate, based on the use of Google™ Earth imagery (2020) and GPS coordinates. Seismic Lines S-1 through S-3 were each 125 feet in length which consisted of a series of twenty-four geophones that were spaced at regular 5-foot centers. Seismic Line S-4 was 200 feet in length which consisted of a series of twenty-four geophones that were spaced at regular 8-foot centers.

To produce the necessary seismic wave energy, a 16-pound sledge-hammer was used as the energy source to generate both the direct and refracted waves. Seven shot points were utilized using forward, reverse, and intermediate locations in order to obtain high resolution survey data for velocity analysis and depth modeling purposes. Each shot point used multiple hammer impacts to increase the signal to noise ratio, which provided clearer first "P"-Wave arrivals.

The seismic wave arrivals were digitally recorded in SEG-2 format on a Geometrics StrataVisor™ NZXP model signal enhancement refraction seismograph. The data was acquired using a sampling rate of 0.0625 milliseconds having a record length of 0.08 to 0.10 seconds with no acquisition filters used in order to preserve the raw wave-forms. The data on the display screen were used to analyze the arrival time of the primary seismic "P"-Waves at each geophone station for quality control purposes in the field. Each geophone and seismic shot location were surveyed using a hand level and ruler for relative topographic correction, with "0" representing the lowest elevation point along the line.

Data Reduction

All of the recorded seismic data was subsequently transferred to our office computer for further processing, analyzing, and printing purposes, using the computer programs **SIPwin** (Seismic Refraction Interpretation Program for Windows) developed by Rimrock Geophysics, Inc. (2004); **Refractor** (Geogiga, 2001-2020); and **Rayfract**™ (Intelligent Resources, Inc., 1996-2021). The associated subsurface profile models for each of these computer modeling programs are presented within Appendices A and B for visual and reference purposes.

- **SIPwin** is a ray-trace modeling program that evaluates the subsurface using layer assignments based on time-distance curves and is better suited for layered media, using the “Seismic Refraction Modeling by Computer” method (Scott, 1973). The first step in the modeling procedure is to compute layer velocities by least-squares techniques. Then the program uses the delay-time method to estimate depths to the top of layer-2. A forward modeling routine traces rays from the shot points to each geophone that received a first-arrival ray refracted along the top of layer-2. The travel time of each such ray is compared with the travel time recorded in the field by the seismic system. The program then adjusts the layer-2 depths so as to minimize discrepancies between the computed ray-trace travel times and the first arrival times picked from the seismic waveform record. The process of ray tracing and model adjustment is repeated a total of three times to improve the accuracy of depths to the top of layer-2.
- **Refractor** is seismic refraction software that also evaluates the subsurface using layer assignments utilizing interactive and interchangeable analytical methods that include the Delay-Time method, the ABC method, and the Generalized Reciprocal Method (GRM). These methods are used for defining irregular non-planar refractors and are briefly described below.
 - The Delay-Time method will measure the delay time depth to a refractor beneath each geophone rather than at shot points. Delay-time is the time spent by a wave to travel up or down through the layer (slant path) compared to the time the wave would spend if traveling along the projection of the slant path on the refractor.
 - The Plus-Minus time analysis method includes a Plus time analysis for depth analysis and a Minus time analysis for velocity determination. The basis of the Plus-Minus time analysis method lies in the travelttime reciprocity, i.e., the travelttime of a seismic wave from source to receiver is equal to the travelttime in the opposite direction if source and receiver are interchanged. It can be used to calculate the depth and velocity variations of an undulating layer boundary for slope angles less than $\sim 10^\circ$.
 - The GRM method is a technique for delineating undulating refractors at any depth from in-line seismic refraction data consisting of forward and reverse travel-times and is capable of resolving dips of up to 20% and does not over-smooth or average the subsurface refracting layers. In addition, the technique provides an approach for recognizing and compensating for hidden layer conditions.
- **Rayfract™** is seismic refraction tomography software that models subsurface refraction, transmission, and diffraction of acoustic waves which generally indicates the relative structure and velocity distribution of the subsurface using first break energy propagation modeling. An initial 1D gradient model is created using the

Delta-t-V method which gives a good initial fit between modeled and picked first breaks. This initial model is then refined automatically with a true 2D WET (Wavepath Eikonal Traveltime) tomographic inversion (Schuster and Quintus-Bosz, 1993). WET tomography models multiple signal propagation paths contributing to one first break, whereas conventional ray tracing tomography is limited to the modeling of just one ray per first break.

The combined use of these computer programs provided a more thorough analysis of the subsurface geologic and lithologic structure, and the seismic velocity characteristics, with respect to identifying any anomalous features that may be suggestive of subsurface faulting. Each computer program has a specific purpose based on the objective of the analysis. **Rayfract**[™] provided tomographic velocity and structural imaging that is very conducive to detecting strong lateral velocity characteristics, while **SIPwin** and **Refractor** are generally based on detecting layered media with some lateral velocity contrast potentially being imaged.

SUMMARY OF DATA ANALYSIS

As previously discussed, the primary purpose of the seismic refraction survey was to aid in evaluating any possible anomalous geologic structures at depth such as offset stratigraphic units (i.e., lateral velocity contrasts) that may be suggestive of subsurface faulting. For this survey we used three different computer processing software programs in order to provide a more thorough analysis of the seismic data of which are described in more detail below, along with the seismic models being presented within Appendices A and B for visual and reference purposes.

◆ **Layer Velocity Models:**

The Layer Velocity Model is a more traditional approach to modeling the subsurface and was analyzed using the computer program **SIPwin** and **Refractor** of which composite models were produced as presented in Appendix A. Based on the models derived from these programs, three distinct seismic velocity layers were encountered, all of which are believed to be alluvial deposits that are progressively older and more consolidated with depth

The uppermost velocity layer V1 is comprised of unconsolidated younger alluvial type materials and possible localized artificial fill, that have an average weighted velocity of 1,213 to 1,389 fps, generally being 3 to 8± feet in thickness. The V2 velocity layer, extends to depths of 20 to 26± feet, and has an average weighted velocity of 1,936 to 2,593 fps. These velocities most likely represents slightly-consolidated relatively older alluvial materials. The deeper V3 velocity layer underlying the subject property at depth where surveyed, has an average weighted velocity of 5,681 to 6,626 fps, which appears to consist of saturated alluvial materials (groundwater). Saturated sediments typically have velocities ranging from 5,000 fps to 7,000 fps (Milson, 1989), depending on the lithologic and consolidated nature of the subsurface

materials. This velocity range is due to the groundwater filling within the interstitial pore spaces of the alluvial materials, therefore resulting in a greater than $5,000\pm$ fps (approximate speed of sound waves in free-water). Therefore, the V2/V3 contact is believed to represent the interface of the groundwater table.

◆ **Refraction Tomographic Models:**

The **Rayfract**[™] tomographic models do not create discrete velocity layers or boundaries but rather produces a “smoothed” tomographic image that displays the velocity gradient within the limits of the seismic wave ray coverage that was sampled. The data appeared to be of good quality which was verified by the Root Mean Square Error (RMS) that is displayed on the lower right-hand corner of each tomographic model. The RMS error (misfit between picked and modeled first break times) is automatically calculated during the processing routine, with a value of less than 5.0% being preferred. The resultant models obtained values of between 2.3 to 6.2% (see the right-hand corner of the refraction tomographic models). The higher RMS value of 6.2% calculated from Seismic Line S-2 is believed to have been influenced from a storm drain running in the vicinity of the seismic traverse, causing spurious wave refractions. Based on the tomographic models that are presented within Appendix B, relatively planar velocity structural contours are depicted with the velocity gradient gradually increasing with depth.

SUMMARY OF FINDINGS AND CONCLUSIONS

The raw field data was considered to be of good quality with minor to moderate amounts of ambient “noise” being introduced during our survey, primarily from vehicular traffic along the nearby roadways/freeway and overhead power transmission lines. Therefore, analysis of the data and picking of the primary “P”-wave arrivals was therefore performed with some difficulty. All of the computer programs performed their analysis using exactly the same input data which includes first-arrival “P”-waves and survey line geometry. The resultant travel-time curve (Time-Distance Plot) that was developed from picking of the primary seismic “P”-wave data is presented on the Layer Velocity Model profiles, as presented within Appendix A.

The results of our comparative seismic analyses of the computer programs **SIPwin**, **Refractor**, and **Rayfract**[™], indicate that the seismic refraction survey line models appear to generally coincide with one another, with some minor variances due to the methods that these programs process and integrate the input data. Based on the layer velocity profiles, it appears that there is a generally thin mantle (up to $8\pm$ feet) of unconsolidated alluvial materials and/or artificial fill overlying the site, with progressively older and denser alluvial deposits at depth. Based on the seismic velocities obtained from the deeper V3 velocity layer, it is believed that the V2/V3 contact boundary represents the local groundwater table encountered at the time of our field survey. The refraction tomographic models revealed overall relatively planar structural velocity contouring.

In summary, based on the data obtained, there do not appear to be any observable anomalous conditions from a geophysical standpoint that would suggest that subsurface faulting is present within the limits of our survey traverses. No sharp lateral velocity offsets or anomalous features were imaged at depth based on the tomographic modeling, nor was there any deflection along the groundwater table interface.

CLOSURE

The field survey was performed by the undersigned on November 13, 2021 using "state of the art" geophysical equipment and techniques along accessible portions of the subject study area. The seismic data was evaluated using various seismic inversion computer programs, including using recently developed tomographic inversion techniques to provide a more thorough analysis and understanding of the subsurface structural conditions. It is important to understand that the fundamental limitation for seismic refraction surveys is known as nonuniqueness, wherein a specific seismic refraction data set does not provide sufficient information to determine a single "true" earth model. Therefore, the interpretation of any seismic data set uses "best-fit" approximations along with the geologic models that appear to be most reasonable for the local area being surveyed. It should be noted that estimates of the layer velocity boundaries are generally considered to be within $10\pm$ percent of the total depth of the contact.

Client should also understand that when using the theoretical geophysical principles and techniques discussed in this report, sources of error are possible in both the data obtained and, in the interpretation, and that the results of this survey may not represent actual subsurface conditions. These are all factors beyond **Terra Geosciences** control and no guarantees as to the results of this survey can be made. We make no warranty, either expressed or implied. If the client does not understand the limitations of this geophysical survey, additional input should be sought from the consultant.

This opportunity to be of service is sincerely appreciated. If you should have any questions regarding this report or do not understand the limitations of this study or the data that is presented, please do not hesitate to contact our office at your earliest convenience.

Respectfully submitted,

LABORATORY TESTS

APPENDIX B

LABORATORY TESTS

B-1.00 LABORATORY TESTS

B-1.01 Maximum Density

Maximum density - optimum moisture relationships for the major soil types encountered during the field exploration were performed in the laboratory using the standard procedures of ASTM D1557.

B-1.02 Atterberg Limits

The liquid limit, plastic limit, and the plasticity index of the major soil types encountered in the test holes were determined using the standard test methods of ASTM D4318.

B-1.03 Expansion Tests

Expansion index tests were performed on representative samples of the major soil types encountered by the test methods outlined in ASTM D4829.

B-1.04 Soluble Sulfates and Chlorides

A test was performed on representative sample encountered during the investigation using the Caltrans Test Methods CTM 417 and CTM 422.

B-1.05 Soil Reactivity (pH) and Electrical Resistivity

Representative soil sample was tested for soil reactivity (pH) and electrical resistivity using California Test Method 643. The pH measurement determines the degree of acidity or alkalinity in the soils.

B-1.06 Specific Gravity

Specific gravity of a representative soil sample was performed using the standard procedures of ASTM D 854, specific gravity of soils by water pycnometer.

B-1.07 Particle Size Analysis

Particle size analysis was performed on representative samples of the major soils types in accordance to the standard test methods of the ASTM D422. The hydrometer portion of the standard procedure was not performed and the material retained on the #200 screen was washed.

B-1.08 Direct Shear

Direct shear tests were performed on representative samples of the major soil types encountered in the test holes using the standard test method of ASTM D3080 (consolidated and drained). Tests were performed on ring samples.

Shear tests were performed on a direct shear machine of the strain-controlled type. To simulate possible adverse field conditions, the samples were saturated prior to shearing. Several samples were sheared at varying normal loads and the results plotted to establish the angle of the internal friction and cohesion of the tested samples.

B-1.09 Resistance Value (R-Value)

Resistance Value tests were performed on representative samples of the major soil types encountered by the test methods outlined in California 301.

B-1.10 Moisture Measurement

Moisture content of the soil samples was performed in accordance to standard method for measurement of water content of soil by drying oven, ASTM D2216. The mass of material remaining after oven drying is used as the mass of the solid particles.

B-1.11 Density of Split-Barrel Samples

Soil samples were obtained by using a split-barrel sampler in accordance to standard method of ASTM D1586

B-1.12 Test Results

Test results for all laboratory tests performed on the subject project are presented in this appendix.

SAMPLE INFORMATION

Sample Number	Sample Description	Sample Location	
		Boring No.	Depth (ft)
1	Brown Silty Clay	B-21	4'-6'
2	Red Brown Clayey Sand	B-22	4'-6'
3	Yellow Brown Clayey Sand	B-23	4'-6'
4	Red Brown Clayey Sand	B-24	4'-6'

MAXIMUM DENSITY - OPTIMUM MOISTURE

Test Method: ASTM D1557

Sample Number	Optimum Moisture (Percent)	Maximum Density (lbs/ft ³)
2	123.9	11.3

ATTERBERG LIMITS

Test Method: ASTM D4318

Sample Location	Liquid Limit	Plastic Index	Soil Classification
B-21	32	17	CL
B-24	40	26	CL

EXPANSION TEST

Test Method: ASTM D4829

Sample Number	Molding Moisture Content (Percent)	Final Moisture Content (Percent)	Initial Dry Density (lbs/ft ³)	Expansion Index	Expansion Classification
3	11.4	15.8	114.9	35	Low

SOLUBLE SULFATES

Test Method: CTM 417 and CTM 422

Sample Number	Soluble Sulfate (ppm)	Soluble Chlorides (ppm)
4	460	32

SOIL REACTIVITY (pH) AND ELECTRICAL RESISTIVITY

Test Method: CTM 643

Sample Number	pH	Resistivity (Ohm-cm)
4	7.3	1,800

PERCENT PASSING #200 SIEVE

Test Method: ASTM D422

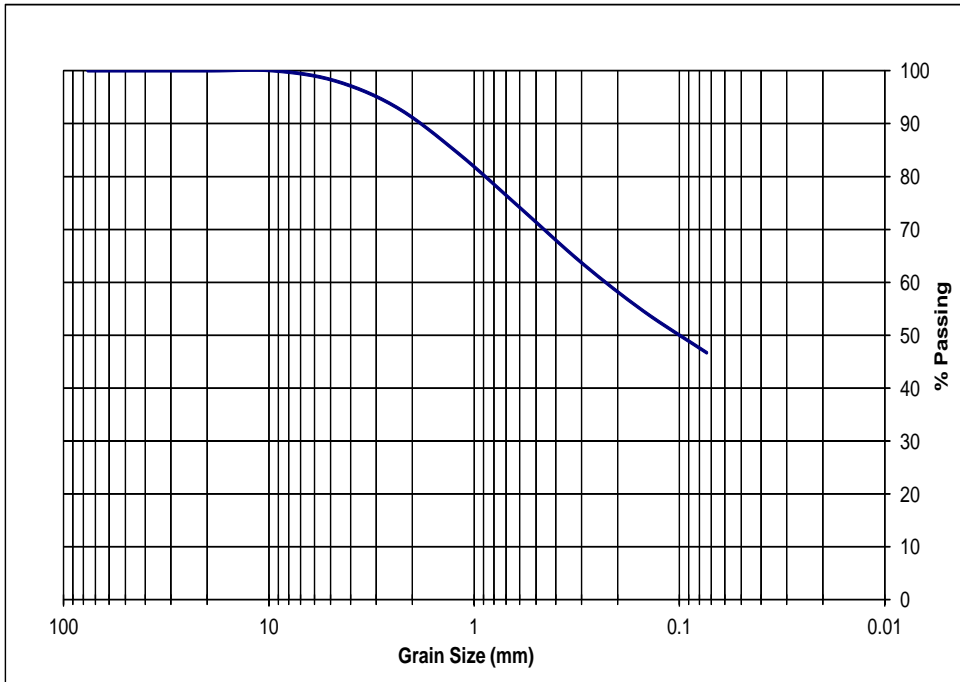

Sample Location	Percent Passing #200 Sieve
B-21 @ 20'	%35.5
B-21 @ 35'	%35.9

PARTICLE SIZE ANALYSIS
ASTM D422

Sample No: 4
Location: B-24 @ 4'-6'

Dry Net Weight (gms): 523.4

Screen Size	Net Retained Weight (lbs)	Net Passing Weight (lbs)	% Passing
3"	0	523.4	100
1-1/2"	0	523.4	100
3/4"	0	523.4	100
3/8"	0	523.4	100

#200	278.9	244.5	47

**DIRECT SHEAR TEST
ASTM D3080**

Sample ID: 2

Location: B-22 @ 4-6'

Maximum Dry Density (pcf) = 123.9
 Optimum Moisture Content (%) = 11.3
 Initial Dry Density (pcf) = 123.9
 Initial Moisture Content (%) = 11.3
 Final Moisture Content (%) = 18.8

Normal Pressure	Peak Shear Resist	Residual Shear Resist
1000	1092	1104
2000	2148	2160
4000	2844	2868

	Peak	Residual
Cohesion (psf) =	740	750
Friction Angle (deg) =	29	29

CTM 301 - DETERMINATION OF RESISTANCE "R" VALUE OF TREATED AND UNTREATED BASES, SUBBASES, AND BASEMENT SOILS BY THE STABILOMETER

Sample ID: 1

Specimen No	A	B	C
Moisture Content (%)	16.2	14.3	12.8
Dry Density (pcf)	111.8	116.7	121.9
Exudation Pressure (psi)	248	346	521
Stabilometer R Value	6	11	23
Expansion Pressure Dial	5	15	39

Use: Traffic Index = 5.0 Gravel Factor = 1.00

Thickness by Expansion (ft)	0.17	0.50	1.30
Thickness by Stabilometer (ft)	1.50	1.42	1.23

Equilibrium Thick (ft) 1.24

Equilibrium Pressure R Value **23**
Exudation Pressure R Value @ 300 psi **9**

Use Exudation R Value

Expansion Pressure R-Value is based on the following structural section:

Thickness of AC (ft)=	0.25	$G_r(ac) =$	2.50	$W(ac) =$	145
Thickness of Aggregate Base (ft)=	0.42	$G_r(base) =$	1.00	$W(base) =$	130
		$G_r(avg) =$	1.56	$W(avg) =$	136

CTM 301 - DETERMINATION OF RESISTANCE "R" VALUE OF TREATED AND UNTREATED BASES, SUBBASES, AND BASEMENT SOILS BY THE STABILOMETER

Sample ID: 4

Specimen No	A	B	C
Moisture Content (%)	12.0	14.0	15.4
Dry Density (pcf)	124.1	118.7	116.6
Exudation Pressure (psi)	648	348	213
Stabilometer R Value	53	15	8
Expansion Pressure Dial	55	29	27

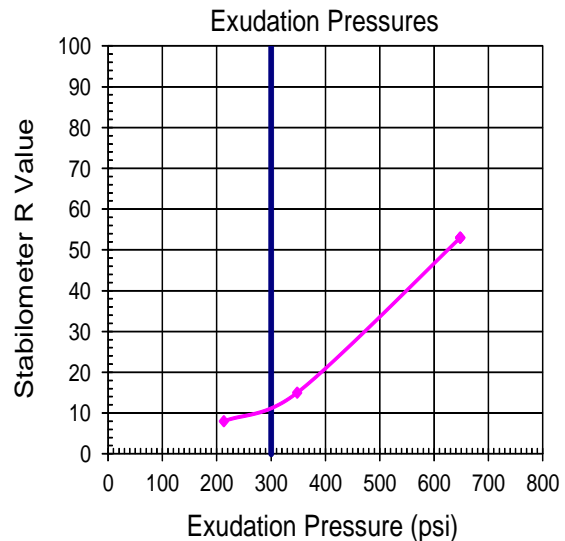

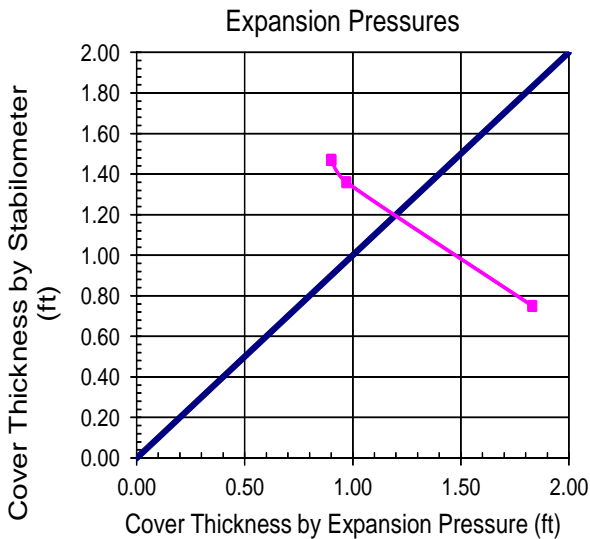

Use: Traffic Index = 5.0 Gravel Factor = 1.00

Thickness by Expansion (ft)	1.83	0.97	0.90
Thickness by Stabilometer (ft)	0.75	1.36	1.47

Equilibrium Thick (ft) 1.22

Equilibrium Pressure R Value **24**
Exudation Pressure R Value @ 300 psi **12**

Use Exudation R Value

Expansion Pressure R-Value is based on the following structural section:

Thickness of AC (ft)=	0.25	$G_f(ac) =$	2.50	$W(ac) =$	145
Thickness of Aggregate Base (ft)=	0.33	$G_f(base) =$	1.10	$W(base) =$	130
		$G_f(avg) =$	1.70	$W(avg) =$	136

Site-Specific MCE_R & Design Response Spectral Accelerations

Important Note

The site-specific, design response spectral acceleration, S_a , returned by this tool for user-specified inputs, must be compared to the minimum S_a requirement described in Section 21.3 of ASCE 7-16 (second and third paragraphs). This minimum S_a is computed as 80% of the design response spectrum derived from the SDS, SD1, and TL values obtained from the ASCE tool at <https://asce7hazardtool.online/>. The larger of the site-specific S_a and the 80% minimum S_a at each period, T , is the final design response spectral acceleration. This final $S_a \times 1.5$ is the final MCE_R response spectral acceleration.

About UGMS

The UGMS MCE_R tool was developed by the SCEC Committee for Utilization of Ground Motion Simulations (or "UGMS Committee") from research supported by the Southern California Earthquake Center (SCEC). SCEC is funded by NSF Cooperative Agreement EAR-1033462 & USGS Cooperative Agreement G12AC20038. For more information on the UGMS Committee, visit <https://www.scec.org/research/ugms>.

The site-specific, design response spectral acceleration, S_a , returned by this tool for user-specified inputs, must be compared to the minimum S_a requirement described in Section 21.3 of ASCE 7-16 (second and third paragraphs). This minimum S_a is computed as 80% of the design response spectrum derived from the SDS, SD1, and TL values obtained from the ASCE tool at <https://asce7hazardtool.online/>.

The larger of the site-specific S_a and the 80% minimum S_a at each period, T , is the final design response spectral acceleration. This final $S_a \times 1.5$ is the final MCER response spectral acceleration.

We show that the site-specific design acceleration parameters are larger than the minimum 80% as presented below:

Section 21.3, ASCE 7-16		Site-specific	
$F_a =$	1.0		
$F_v =$	2.5		
$S_S =$	2.132		
$S_1 =$	0.745		
$S_{MS} =$	2.132	2.412	$2.412 > 0.8(2.132) = 1.706$
$S_{M1} =$	1.863	1.644	$1.644 > 0.8(1.863) = 1.490$
$S_{DS} =$	1.421	1.608	$1.608 > 0.8(1.421) = 1.137$
$S_{D1} =$	1.242	1.096	$1.096 > 0.8(1.242) = 0.994$

* F.S.<1, Liquefaction Potential Zone
(F.S. is limited to 5, CRR is limited to 2, CSR is limited to 2)

Units: Unit: qc, fs, Stress or Pressure = atm (1.0581tsf); Unit Weight = pcf; Depth = ft; Settlement = in.

1 atm (atmosphere) = 1 tsf (ton/ft²)

CRRm Cyclic resistance ratio from soils
 CSRsf Cyclic stress ratio induced by a given earthquake (with user request factor of safety)
 F.S. Factor of Safety against liquefaction, F.S.=CRRm/CSRsf
 S_sat Settlement from saturated sands
 S_dry Settlement from Unsaturated Sands
 S_all Total Settlement from Saturated and Unsaturated Sands
 NoLiq No-Liquefy Soils

LIQUEFACTION ANALYSIS

Irving MS

Hole No.=B-14 Water Depth=25 ft

Magnitude=6.9
Acceleration=0.916g

LIQUEFACTION ANALYSIS SUMMARY

Input File Name: C:\Users\jmeneses\Desktop\RMA projects\21-1331-0 Irving MS\Boring B-14.liq
Title: Irving MS
Subtitle: Boring B-14

Surface Elev.=
Hole No.=B-14
Depth of Hole= 51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 15.00 ft
Max. Acceleration= 0.92 g
Earthquake Magnitude= 6.90

Input Data:

Surface Elev.=
Hole No.=B-14
Depth of Hole=51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 15.00 ft
Max. Acceleration=0.92 g
Earthquake Magnitude=6.90
No-Liquefiable Soils: CL, OL are Non-Liq. Soil

1. SPT or BPT Calculation.
 2. Settlement Analysis Method: Tokimatsu, M-correction
 3. Fines Correction for Liquefaction: Idriss/Seed
 4. Fine Correction for Settlement: During Liquefaction*
 5. Settlement Calculation in: All zones*
 6. Hammer Energy Ratio, Ce = 1.25
 7. Borehole Diameter, Cb= 1
 8. Sampling Method, Cs= 1.2
 9. User request factor of safety (apply to CSR) , User= 1.3
Plot one CSR curve (fs1=User)
 10. Use Curve Smoothing: Yes*
- * Recommended Options

In-Situ Test Data:

Depth ft	SPT	gamma pcf	Fines %
5.00	28.50	135.60	35.00
10.00	25.10	121.50	35.00
15.00	20.00	125.00	NoLiq
20.00	21.00	125.00	NoLiq
25.00	13.00	125.00	NoLiq
30.00	29.00	125.00	NoLiq
35.00	34.00	125.00	NoLiq
40.00	26.00	125.00	NoLiq
45.00	51.00	125.00	NoLiq
50.00	29.00	125.00	NoLiq

Output Results:

Settlement of Saturated Sands=0.00 in.
Settlement of Unsaturated Sands=0.48 in.
Total Settlement of Saturated and Unsaturated Sands=0.48 in.
Differential Settlement=0.240 to 0.317 in.

* F.S.<1, Liquefaction Potential Zone
(F.S. is limited to 5, CRR is limited to 2, CSR is limited to 2)

Units: Unit: qc, fs, Stress or Pressure = atm (1.0581tsf); Unit Weight = pcf; Depth = ft; Settlement = in.

1 atm (atmosphere) = 1 tsf (ton/ft²)
CRRm Cyclic resistance ratio from soils
CSRsf Cyclic stress ratio induced by a given earthquake (with user request factor of safety)
F.S. Factor of Safety against liquefaction, F.S.=CRRm/CSRsf
S_sat Settlement from saturated sands
S_dry Settlement from Unsaturated Sands
S_all Total Settlement from Saturated and Unsaturated Sands
NoLiq No-Liquefy Soils

LIQUEFACTION ANALYSIS

Irving MS

Hole No.=B-17 Water Depth=25 ft

Magnitude=6.9
Acceleration=0.916g

LIQUEFACTION ANALYSIS SUMMARY

Input File Name: C:\Users\jmeneses\Desktop\RMA projects\21-1331-0 Irving MS\Boring B-17.liq
Title: Irving MS
Subtitle: Boring B-17

Surface Elev.=
Hole No.=B-17
Depth of Hole= 51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 20.00 ft
Max. Acceleration= 0.92 g
Earthquake Magnitude= 6.90

Input Data:

Surface Elev.=
Hole No.=B-17
Depth of Hole=51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 20.00 ft
Max. Acceleration=0.92 g
Earthquake Magnitude=6.90
No-Liquefiable Soils: CL, OL are Non-Liq. Soil

1. SPT or BPT Calculation.
 2. Settlement Analysis Method: Tokimatsu, M-correction
 3. Fines Correction for Liquefaction: Idriss/Seed
 4. Fine Correction for Settlement: During Liquefaction*
 5. Settlement Calculation in: All zones*
 6. Hammer Energy Ratio, Ce = 1.25
 7. Borehole Diameter, Cb= 1
 8. Sampling Method, Cs= 1.2
 9. User request factor of safety (apply to CSR) , User= 1.3
Plot one CSR curve (fs1=User)
 10. Use Curve Smoothing: Yes*
- * Recommended Options

In-Situ Test Data:

Depth ft	SPT	gamma pcf	Fines %
5.00	37.40	134.70	NoLiq
10.00	55.80	117.40	35.00
15.00	17.00	125.00	NoLiq
20.00	28.00	125.00	35.00
25.00	22.00	125.00	NoLiq
30.00	15.00	125.00	NoLiq
35.00	19.00	125.00	NoLiq
40.00	21.00	125.00	NoLiq
45.00	41.00	125.00	NoLiq
50.00	40.00	125.00	NoLiq

Output Results:

Settlement of Saturated Sands=0.00 in.
Settlement of Unsaturated Sands=0.35 in.
Total Settlement of Saturated and Unsaturated Sands=0.35 in.
Differential Settlement=0.177 to 0.234 in.

* F.S.<1, Liquefaction Potential Zone
(F.S. is limited to 5, CRR is limited to 2, CSR is limited to 2)

Units: Unit: qc, fs, Stress or Pressure = atm (1.0581tsf); Unit Weight = pcf; Depth = ft; Settlement = in.

1 atm (atmosphere) = 1 tsf (ton/ft²)
CRRm Cyclic resistance ratio from soils
CSRsf Cyclic stress ratio induced by a given earthquake (with user request factor of safety)
F.S. Factor of Safety against liquefaction, F.S.=CRRm/CSRsf
S_sat Settlement from saturated sands
S_dry Settlement from Unsaturated Sands
S_all Total Settlement from Saturated and Unsaturated Sands
NoLiq No-Liquefy Soils

LIQUEFACTION ANALYSIS

Irving MS

Hole No.=B-21 Water Depth=25 ft

Magnitude=6.9
Acceleration=0.916g

LIQUEFACTION ANALYSIS SUMMARY

Input File Name: C:\Users\jmeneses\Desktop\RMA projects\21-1331-0 Irving MS\Boring B-21.liq
Title: Irving MS
Subtitle: Boring B-21

Surface Elev.=
Hole No.=B-21
Depth of Hole= 51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 15.00 ft
Max. Acceleration= 0.92 g
Earthquake Magnitude= 6.90

Input Data:

Surface Elev.=
Hole No.=B-21
Depth of Hole=51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 15.00 ft
Max. Acceleration=0.92 g
Earthquake Magnitude=6.90
No-Liquefiable Soils: CL, OL are Non-Liq. Soil

1. SPT or BPT Calculation.
 2. Settlement Analysis Method: Tokimatsu, M-correction
 3. Fines Correction for Liquefaction: Idriss/Seed
 4. Fine Correction for Settlement: During Liquefaction*
 5. Settlement Calculation in: All zones*
 6. Hammer Energy Ratio, Ce = 1.25
 7. Borehole Diameter, Cb= 1
 8. Sampling Method, Cs= 1.2
 9. User request factor of safety (apply to CSR) , User= 1.3
Plot one CSR curve (fs1=User)
 10. Use Curve Smoothing: Yes*
- * Recommended Options

In-Situ Test Data:

Depth ft	SPT	gamma pcf	Fines %
5.00	16.20	130.10	NoLiq
10.00	24.60	131.70	NoLiq
15.00	18.00	125.00	NoLiq
20.00	28.00	125.00	35.50
25.00	21.00	125.00	NoLiq
30.00	30.00	125.00	NoLiq
35.00	34.00	125.00	35.90
40.00	19.00	125.00	35.90
45.00	22.00	125.00	35.90
50.00	33.00	125.00	35.90

Output Results:

Settlement of Saturated Sands=0.24 in.
Settlement of Unsaturated Sands=0.34 in.
Total Settlement of Saturated and Unsaturated Sands=0.58 in.
Differential Settlement=0.289 to 0.381 in.

* F.S.<1, Liquefaction Potential Zone
(F.S. is limited to 5, CRR is limited to 2, CSR is limited to 2)

Units: Unit: qc, fs, Stress or Pressure = atm (1.0581tsf); Unit Weight = pcf; Depth = ft; Settlement = in.

1 atm (atmosphere) = 1 tsf (ton/ft²)
CRRm Cyclic resistance ratio from soils
CSRsf Cyclic stress ratio induced by a given earthquake (with user request factor of safety)
F.S. Factor of Safety against liquefaction, F.S.=CRRm/CSRsf
S_sat Settlement from saturated sands
S_dry Settlement from Unsaturated Sands
S_all Total Settlement from Saturated and Unsaturated Sands
NoLiq No-Liquefy Soils

LIQUEFACTION ANALYSIS

Irving MS

Hole No.=B-22 Water Depth=25 ft

Magnitude=6.9
Acceleration=0.916g

LIQUEFACTION ANALYSIS SUMMARY

Input File Name: C:\Users\jmeneses\Desktop\RMA projects\21-1331-0 Irving MS\Boring B-22.liq
Title: Irving MS
Subtitle: Boring B-22

Surface Elev.=
Hole No.=B-22
Depth of Hole= 51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 20.00 ft
Max. Acceleration= 0.92 g
Earthquake Magnitude= 6.90

Input Data:

Surface Elev.=
Hole No.=B-22
Depth of Hole=51.50 ft
Water Table during Earthquake= 25.00 ft
Water Table during In-Situ Testing= 20.00 ft
Max. Acceleration=0.92 g
Earthquake Magnitude=6.90
No-Liquefiable Soils: CL, OL are Non-Liq. Soil

1. SPT or BPT Calculation.
 2. Settlement Analysis Method: Tokimatsu, M-correction
 3. Fines Correction for Liquefaction: Idriss/Seed
 4. Fine Correction for Settlement: During Liquefaction*
 5. Settlement Calculation in: All zones*
 6. Hammer Energy Ratio, Ce = 1.25
 7. Borehole Diameter, Cb= 1
 8. Sampling Method, Cs= 1.2
 9. User request factor of safety (apply to CSR) , User= 1.3
Plot one CSR curve (fs1=User)
 10. Use Curve Smoothing: Yes*
- * Recommended Options

In-Situ Test Data:

Depth ft	SPT	gamma pcf	Fines %
5.00	16.00	125.00	35.00
8.00	25.00	125.00	35.00
15.00	28.00	125.00	NoLiq
20.00	31.00	125.00	NoLiq
25.00	39.00	125.00	NoLiq
30.00	29.00	125.00	NoLiq
35.00	62.00	125.00	NoLiq
40.00	32.00	125.00	NoLiq
45.00	30.00	125.00	NoLiq
50.00	56.00	125.00	NoLiq

Output Results:

Settlement of Saturated Sands=0.00 in.
Settlement of Unsaturated Sands=0.42 in.
Total Settlement of Saturated and Unsaturated Sands=0.42 in.
Differential Settlement=0.211 to 0.278 in.

APPENDIX C

GENERAL EARTHWORK AND GRADING SPECIFICATIONS

APPENDIX C

GENERAL EARTHWORK AND GRADING SPECIFICATIONS

C-1.00 GENERAL DESCRIPTION

C-1.01 Introduction

These specifications present our general recommendations for earthwork and grading as shown on the approved grading plans for the subject project. These specifications shall cover all clearing and grubbing, removal of existing structures, preparation of land to be filled, filling of the land, spreading, compaction and control of the fill, and all subsidiary work necessary to complete the grading of the filled areas to conform with the lines, grades and slopes as shown on the approved plans.

The recommendations contained in the geotechnical report of which these general specifications are a part of shall supersede the provisions contained hereinafter in case of conflict.

C-1.02 Laboratory Standard and Field Test Methods

The laboratory standard used to establish the maximum density and optimum moisture shall be ASTM D1557.

The insitu density of earth materials (field compaction tests) shall be determined by the sand cone method (ASTM D1556), direct transmission nuclear method (ASTM D2922) or other test methods as considered appropriate by the geotechnical consultant.

Relative compaction is defined, for purposes of these specifications, as the ratio of the in-place density to the maximum density as determined in the previously mentioned laboratory standard.

C-2.00 CLEARING

C-2.01 Surface Clearing

All structures marked for removal, timber, logs, trees, brush and other rubbish shall be removed and disposed of off the site. Any trees to be removed shall be pulled in such a manner so as to remove as much of the root system as possible.

C-2.02 Subsurface Removals

A thorough search should be made for possible underground storage tanks and/or septic tanks and cesspools. If found, tanks should be removed and cesspools pumped dry.

Any concrete irrigation lines shall be crushed in place and all metal underground lines shall be removed from the site.

C-2.03 Backfill of Cavities

All cavities created or exposed during clearing and grubbing operations or by previous use of the site shall be cleared of deleterious material and backfilled with native soils or other materials approved by the soil engineer. Said backfill

shall be compacted to a minimum of 90% relative compaction.

C-3.00 ORIGINAL GROUND PREPARATION

C-3.01 Stripping of Vegetation

After the site has been properly cleared, all vegetation and topsoil containing the root systems of former vegetation shall be stripped from areas to be graded. Materials removed in this stripping process may be used as fill in areas designated by the soil engineer, provided the vegetation is mixed with a sufficient amount of soil to assure that no appreciable settlement or other detriment will occur due to decaying of the organic matter. Soil materials containing more than 3% organics shall not be used as structural fill.

C-3.02 Removals of Non-Engineered Fills

Any non-engineered fills encountered during grading shall be completely removed and the underlying ground shall be prepared in accordance to the recommendations for original ground preparation contained in this section. After cleansing of any organic matter the fill material may be used for engineered fill.

C-3.03 Overexcavation of Fill Areas

The existing ground in all areas determined to be satisfactory for the support of fills shall be scarified to a minimum depth of 6 inches. Scarification shall continue until the soils are broken down and free from lumps or clods and until the scarified zone is uniform. The moisture content of the scarified zone shall be adjusted to within 2% of optimum moisture. The scarified zone shall then be uniformly compacted to 90% relative compaction.

Where fill material is to be placed on ground with slopes steeper than 5:1 (H:V) the sloping ground shall be benched. The lowermost bench shall be a minimum of 15 feet wide, shall be a minimum of 2 feet deep, and shall expose firm material as determined by the geotechnical consultant. Other benches shall be excavated to firm material as determined by the geotechnical consultant and shall have a minimum width of 4 feet.

Existing ground that is determined to be unsatisfactory for the support of fills shall be overexcavated in accordance to the recommendations contained in the geotechnical report of which these general specifications are a part.

C-4.00 FILL MATERIALS

C-4.01 General

Materials for the fill shall be free from vegetable matter and other deleterious substances, shall not contain rocks or lumps of a greater dimension than is recommended by the geotechnical consultant, and shall be approved by the geotechnical consultant. Soils of poor gradation, expansion, or strength properties shall be placed in areas designated by the geotechnical consultant or shall be mixed with other soils providing satisfactory fill material.

C-4.02 Oversize Material

Oversize material, rock or other irreducible material with a maximum dimension greater than 12 inches, shall not be placed in fills, unless the location, materials, and disposal methods are specifically approved by the geotechnical consultant. Oversize material shall be placed in such a manner that nesting of oversize material does not occur and in such a manner that the oversize material is completely surrounded by fill material compacted to a minimum of

90% relative compaction. Oversize material shall not be placed within 10 feet of finished grade without the approval of the geotechnical consultant.

C-4.03 Import

Material imported to the site shall conform to the requirements of Section 4.01 of these specifications. Potential import material shall be approved by the geotechnical consultant prior to importation to the subject site.

C-5.00 PLACING AND SPREADING OF FILL

C-5.01 Fill Lifts

The selected fill material shall be placed in nearly horizontal layers which when compacted will not exceed approximately 6 inches in thickness. Thicker lifts may be placed if testing indicates the compaction procedures are such that the required compaction is being achieved and the geotechnical consultant approves their use.

Each layer shall be spread evenly and shall be thoroughly blade mixed during the spreading to insure uniformity of material in each layer.

C-5.02 Fill Moisture

When the moisture content of the fill material is below that recommended by the soils engineer, water shall then be added until the moisture content is as specified to assure thorough bonding during the compacting process.

When the moisture content of the fill material is above that recommended by the soils engineer, the fill material shall be aerated by blading or other satisfactory methods until the moisture content is as specified.

C-5.03 Fill Compaction

After each layer has been placed, mixed, and spread evenly, it shall be thoroughly compacted to not less than 90% relative compaction. Compaction shall be by sheepfoot rollers, multiple-wheel pneumatic tired rollers, or other types approved by the soil engineer.

Rolling shall be accomplished while the fill material is at the specified moisture content. Rolling of each layer shall be continuous over its entire area and the roller shall make sufficient trips to insure that the desired density has been obtained.

C-5.04 Fill Slopes

Fill slopes shall be compacted by means of sheepfoot rollers or other suitable equipment. Compacting of the slopes may be done progressively in increments of 3 to 4 feet in fill height. At the completion of grading, the slope face shall be compacted to a minimum of 90% relative compaction. This may require track rolling or rolling with a grid roller attached to a tractor mounted side-boom.

Slopes may be over filled and cut back in such a manner that the exposed slope faces are compacted to a minimum of 90% relative compaction.

The fill operation shall be continued in six inch (6") compacted layers, or as specified above, until the fill has been brought to the finished slopes and grades as shown on the accepted plans.

C-5.05 Compaction Testing

Field density tests shall be made by the geotechnical consultant of the compaction of each layer of fill. Density tests shall be made at locations selected by the geotechnical consultant.

Frequency of field density tests shall be not less than one test for each 2.0 feet of fill height and at least every one thousand cubic yards of fill. Where fill slopes exceed four feet in height their finished faces shall be tested at a frequency of one test for each 1000 square feet of slope face.

Where sheepfoot rollers are used, the soil may be disturbed to a depth of several inches. Density reading shall be taken in the compacted material below the disturbed surface. When these readings indicate that the density of any layer of fill or portion thereof is below the required density, the particular layer or portion shall be reworked until the required density has been obtained.

C-6.00 SUBDRAINS

C-6.01 Subdrain Material

Subdrains shall be constructed of a minimum 4-inch diameter pipe encased in a suitable filter material. The subdrain pipe shall be Schedule 40 Acrylonitrile Butadiene Styrene (ABS) or Schedule 40 Polyvinyl Chloride Plastic (PVC) pipe or approved equivalent. Subdrain pipe shall be installed with perforations down. Filter material shall consist of 3/4" to 1 1/2" clean gravel wrapped in an envelope of filter fabric consisting of Mirafi 140N or approved equivalent.

C-6.02 Subdrain Installation

Subdrain systems, if required, shall be installed in approved ground to conform the approximate alignment and details shown on the plans or herein. The subdrain locations shall not be changed or modified without the approval of the geotechnical consultant. The geotechnical consultant may recommend and direct changes in the subdrain line, grade or material upon approval by the design civil engineer and the appropriate governmental agencies.

C-7.00 EXCAVATIONS

C-7.01 General

Excavations and cut slopes shall be examined by the geotechnical consultant. If determined necessary by the geotechnical consultant, further excavation or overexcavation and refilling of overexcavated areas shall be performed, and/or remedial grading of cut slopes shall be performed.

C-7.02 Fill-Over-Cut Slopes

Where fill-over-cut slopes are to be graded the cut portion of the slope shall be made and approved by the geotechnical consultant prior to placement of materials for construction of the fill portion of the slope.

C-8.00 TRENCH BACKFILL

C-.01 General

Trench backfill within street right of ways shall be compacted to 90% relative compaction as determined by the ASTM D1557 test method. Backfill may be jetted as a means of initial compaction; however, mechanical compaction will be required to obtain the required percentage of relative compaction. If trenches are jetted, there must be a suitable delay for drainage of excess water before mechanical compaction is applied.

C-9.00 SEASONAL LIMITS

C-9.01 General

No fill material shall be placed, spread or rolled while it is frozen or thawing or during unfavorable weather conditions. When the work is interrupted by heavy rain, fill operations shall not be resumed until field tests by the soils engineer indicate that the moisture content and density of the fill are as previously specified.

C-10.00 SUPERVISION

C-10.01 Prior to Grading

The site shall be observed by the geotechnical consultant upon completion of clearing and grubbing, prior to the preparation of any original ground for preparation of fill.

The supervisor of the grading contractor and the field representative of the geotechnical consultant shall have a meeting and discuss the geotechnical aspects of the earthwork prior to commencement of grading.

C-10.02 During Grading

Site preparation of all areas to receive fill shall be tested and approved by the geotechnical consultant prior to the placement of any fill.

The geotechnical consultant or his representative shall observe the fill and compaction operations so that he can provide an opinion regarding the conformance of the work to the recommendations contained in this report.

* Based on ASTM D1557

** If class 2 permeable material (See gradation to left) is used in place of 3/4" - 1 1/2" gravel. Filter fabric may be deleted. Class 2 permeable material compacted to 90% relative compaction. *

SAPPHOS ENVIRONMENTAL, INC.

Attn: Lilibeth Tome

re: Paleontological resources for the Irving Middle School Modernization Project

Dear Lilibeth:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for proposed development at the Irving Middle School Modernization Project area as outlined on the portion of the Los Angeles USGS topographic quadrangle map that you sent to me via e-mail on August 11, 2023. We do not have any fossil localities that lie directly within the proposed project area, but we do have fossil localities nearby from the same sedimentary deposits that occur in the proposed project area, either at the surface or at depth.

The following table shows the closest known localities in the collection of the Natural History Museum of Los Angeles County (NHMLA).

Locality Number	Location	Formation	Taxa	Depth
LACM VP CIT342	Sparkletts property near 45th & Lincoln in Highland Park	Unrecorded (Pleistocene)	Mammoth (<i>Mammuthus</i>), Bison (<i>Bison</i>)	14 feet bgs
LACM VP 1880	3320 Seymour St., W of Mt. Washington	Modelo Formation (orange shale)	Fish (Osteichthyes)	surface
LACM VP 7507	Near intersection of San Fernando Rd. & Humboldt St.	Monterey Formation	Fish (<i>Thyrsocles kriegeri</i>)	31-32 m bgs (collected during excavations of the Humboldt Street Sewer Shaft)
LACM VP 6297 - 6300	Metro Rail Red Line Hollywood Blvd. subway tunnel, Hollywood Blvd from St. Andrews Place to Western Ave	Older alluvium (pebble-gravel; sand; sand & clay)	Horse (<i>Equus</i>), mastodon (<i>Mammut americanum</i>), bison (<i>Bison</i>), camel (<i>Camelops</i>)	47-80 feet bgs
LACM VP 3250	Madison & Middlebury Streets	Unrecorded (Pleistocene)	Mammoth (<i>Mammuthus</i>)	8 feet bgs

VP, Vertebrate Paleontology; IP, Invertebrate Paleontology; bgs, below ground surface

This records search covers only the records of the NHMLA. It is not intended as a paleontological assessment of the project area for the purposes of CEQA or NEPA. Potentially fossil-bearing units are present in the project area, either at the surface or in the subsurface. As such, NHMLA recommends that a full paleontological assessment of the project area be conducted by a paleontologist meeting Bureau of Land Management or Society of Vertebrate Paleontology standards.

Sincerely,

A handwritten signature in black ink that reads "Alyssa Bell". The signature is written in a cursive style and is centered within a light gray rectangular box.

INTEROFFICE CORRESPONDENCE
Los Angeles Unified School District
Office of Environmental Health and Safety

DATE: October 4, 2023

TO: Elston Soares
Facilities Development Manager
FSD – Asset Management

FROM: Filmon Tesfaslasie,
Site Assessment Project Manager (CP)
Office of Environmental Health and Safety

**SUBJECT: IRVING MIDDLE SCHOOL
PRELIMINARY ENVIRONMENTAL ASSESSMENT – MAJOR
MODERNIZATION**

The Office of Environmental Health and Safety (OEHS) has prepared this correspondence to transmit the Preliminary Environmental Assessment (PEA) report (attached) for the Major Modernization Project at Irving Middle School (the “Site”) located at 3010 Estara Avenue, Los Angeles, California 90065.

In May and June of 2023, following OEHS guidelines, the Civil-Environmental-Survey Group (CES) completed soil investigation activities in areas planned to be part of the Major Modernization Project. The CES made the following conclusion based on their investigation:

1. A former oil heating underground storage tank (UST) and hydrocarbon impacted soil adjacent to the UST were identified to be present north of the Administration Building.
2. Arsenic-impacted soil was identified in five locations (B10, B12, B31, B47, and B56) in the shallow soil within the site.
3. Asbestos-impacted soil was identified in two locations (B19 and B22) in the shallow soil within the site.
4. All other remaining chemicals of concern, including the ones listed in the South Coast Air Quality Management District (SCAQMD) Rule 1466, such as lead, cadmium, nickel, mercury, polyaromatic hydrocarbons (PAHs), polychlorinated biphenyl (PCBs), and others were reported below their respective screening level or the 95% Upper Confidence Limit (95% UCL).

Based on the investigation, CES recommends the development of a Soil Removal Plan (SRP) to address the shallow soils impacted with arsenic and asbestos. The SRP will also include a work plan to remove the UST, associated pipelines, and impacted soil adjacent to the UST. Compliance with SCAQMD Rule 1466 is not required in the remainder area (outside the subject area of the SRP).

Should you have any questions or concerns regarding this memorandum, please contact OEHS Site Assessment Project Manager Filmon Tesfaslasie at (213) 241-4578 or at cp-f.tesfaslasie@lausd.net.

1.0 EXECUTIVE SUMMARY

This Preliminary Environmental Assessment (PEA-E) Equivalent Document summarizes historical site land use and outlines the approach utilized and data collected as part of the recently concluded assessment conducted for Washington Irving Middle School, located at 3010 Estara Ave, Los Angeles, California 90065.

The Site houses 17 buildings with 65 classrooms. It has several sports fields and designated parking areas. The site has a mixture of paved and unpaved areas and is located in a mixed residential and commercial area.

The primary objectives of this PEA-E were to assess shallow soil for potential environmental concerns identified in Eco & Associates' Phase I Environmental Site Assessment (ESA) conducted in March 2022, and to evaluate the overall Site health risk based on soil analytical screening results for chemicals of potential concern (COPCs), including lead, arsenic, organochlorine pesticides (OCPs), polychlorinated biphenyls (PCBs), total petroleum hydrocarbons (TPH), polycyclic aromatic hydrocarbons (PAHs), and asbestos (Chrysotile).

The PEA-E field sampling activities presented herein were conducted on May 20 & 21 2023, June 23, and July 21, 2023. A total of 51 locations were advanced to a maximum depth of 2.5 feet below ground surface (bgs) using hand auger methods. A total of 10 locations were advanced to a maximum of 5 feet bgs using hand auger methods. Soil samples were collected from 0.5, 2.5 and 5 feet. All 0.5 ft samples were analyzed for COPCs while deeper samples were held at the lab, pending shallow sample results. A total of 2 locations were advanced to a maximum depth of 25 feet bgs via geoprobe. Soil samples from B58-B59 were collected at 0.5, 2.5, 5, 10, 15, 20, and 25 feet bgs. 0.5 ft, 2.5 ft, and 5 ft samples were analyzed for COPCs while deeper samples were held at the lab. Two samples were collected from the suspected tank location. Boring locations are shown on Figures 2 and 3. The soil matrix analytical results (Tables 2-5) indicate that elevated levels of lead were detected at 10 locations during initial screening, and elevated levels of arsenic were detected at 8 locations during initial screening. Based on the analytical results and comparisons with the screening levels, none of the soil was determined to contain hazardous levels of lead or arsenic. The 95% UCL for lead is 53.61 mg/kg and the 95% UCL for arsenic is 17.23 mg/kg. If the soil surrounding B10, B12, B31, B47, and B56 is removed, the 95% UCL for arsenic will be reduced to 6.43 mg/kg, which is below the screening level of 12 mg/kg. Asbestos was detected in 2 samples.

A geophysical survey of the suspected UST area was conducted and 2 anomalies were located. Anomaly A was identified as rectangular in shape and approximately 17 feet by 12 feet in size and indicative of a steel UST. Anomaly B is rectangular in shape and approximately 5 feet by 8 feet in size but was not considered typical of data associated with a UST. Further investigation of Anomaly A revealed a concrete layer at 2 feet bgs and the top of a suspected tank at 13 feet 8 inches bgs. Impacted soil was observed in the area surrounding the tank with concentrations of diesel-range hydrocarbons of 3400 mg/kg and VOCs ranging from ND to 8.8 mg/kg. The concrete layer may be indicative of secondary containment surrounding the tank. Impacted soil surrounding the UST will require removal along with the removal of the UST and any associated piping.

2.0 INTRODUCTION

This Preliminary Environmental Assessment (PEA-E) Equivalent Document summarizes historical site land use and outlines the approach utilized and data collected during site assessment activities at Washington Irving Middle School, located at 3010 Estara Ave, Los Angeles, CA 90065 (Site). The purpose of the assessment was to determine if the Site's surficial soils were impacted with contaminants of potential concern.

This report was prepared by CES Group on behalf of the Los Angeles Unified School District (LAUSD). The data provided in this report is based on information obtained during Eco & Associates' Phase I investigation of the site. The site location is shown on Figure 2.

2.1 Site Description

The Site is known as the Washington Irving Middle School and is located at 3010 Estara Ave Street, Los Angeles, California 90065. The Property is located between the residential areas of the Glassell Park and Atwater Village neighborhoods, south of Forest Lawn Cemetery in Glendale. The site includes APNs 5458-018-903 through -917 and 5458-019-900.

The Site is an operating school that occupies an 11.18-acre area with 65 existing classrooms. It houses 11 permanent and 6 relocatable buildings. The remaining area is occupied by parking spaces, sports fields, landscaping, and playgrounds. The property is located within a largely residential and commercial area.

Eco & Associates prepared a *Phase I Environmental Site Assessment Report* (Phase I) in March 2022 for the Site.

2.2 Background

Washington Irving Middle School is an active middle school.

A brief summary of the former Site use/operations is provided as follows:

- The land remained mostly undeveloped in the late 1800s.
- The Site was developed as residential property in the early 1900s, with a large residence to the North and smaller residential properties with a bisecting street to the South.
- During 1936 and 1937 parts of the existing school were developed on the Northern part of the site, which was originally part of the large residence.
- In the 1940s the school property expanded to the south, replacing residential properties.
- In the 1980s the school expanded again to the northwest.
- The current structures and building configurations have been present since approximately 2004.

2.3 Regional Geology and Hydrogeology

According to the Phase I report, the Site is situated near latitude 34.11682 (north) and longitude -118.24103 (west) at an approximate elevation of 404 feet above mean sea level. The topography of the Site and vicinity is generally flat, but slopes gently to the south, as shown in the Van Nuys, California USGS Topographic Map. The Site is not located within a flood hazard area.

The Site is located in Los Angeles County. Regionally, the site is located within the Transverse Ranges geomorphic province. This province is characterized by east-west trending geologic structures that include the east-west trending Santa Monica Mountains and the east-west trending active San Fernando fault zone. The trend of the San Fernando Valley reflects the overall trend of the Transverse Ranges, where major structural features exhibit an east-west orientation in contrast to the northwest-southeast trend that dominates in the rest of California. The San Fernando Valley is an area of compression between the San Gabriel Mountains on the northeast and the Santa Monica Mountains on the south. The east-west trend is reflected by the nearby San Fernando fault zone located approximately 4.4 miles to the north-northeast. The closest active fault is the Raymond fault, located less than one mile North of the site.

The Site is located in Los Angeles County, within the San Fernando Valley Groundwater Basin (Basin No. 4-12). According to the California Department of Water Resources (Bulletin 118, updated 2003), this area is classified as:

The San Fernando Valley Groundwater Basin includes the water-bearing sediments beneath the San Fernando Valley, Tujunga Valley, Browns Canyon, and the alluvial areas surrounding the Verdugo Mountains near La Crescenta and Eagle Rock. The basin is bounded on the north and northwest by the Santa Susana Mountains, on the north and northeast by the San Gabriel Mountains, on the east by the San Rafael Hills, on the south by the Santa Monica Mountains and Chalk Hills, and on the west by the Simi Hills.

The water-bearing sediments consist of the lower Pleistocene Saugus Formation, Pleistocene and Holocene age alluvium. The groundwater in this basin is mainly unconfined with some confinement within the Saugus Formation in the western part of the basin and in the Sylmar and Eagle Rock areas. Groundwater flows generally from the edges of the basin toward the middle of the basin, then beneath the Los Angeles River Narrows into the Central Subbasin of the Coastal Plain of Los Angeles Basin. In the northeastern part of the basin, groundwater moves from the La Crescenta area southward beneath the surface of Verdugo Canyon toward the Los Angeles River near Glendale, whereas the groundwater in the Tujunga area flows west following the Tujunga Wash around the Verdugo Mountains to join groundwater flowing from the west following the course of the Los Angeles River near Glendale.

Groundwater in the vicinity of the Site is reported to occur at approximately 61-63 feet bgs at the Former Aquality, Inc located at 3030 Andrita Street.

2.4 Environmental Setting

A Phase I ESA was completed for the School property in March 2022 by Eco & Associates, Inc. The purpose of the Phase I ESA is to identify recognized environmental conditions (RECs) in order to assist in the evaluation of historical land use, assess potential environmental impacts on- and off-site, and determine if any potential environmental impacts may pose a threat to on-site occupants, off-site individuals and the environment. No other environmental investigations for the School property were located during the Phase I ESA. Information pertaining to the Site as determined by the Phase I ESA is summarized below.

2.4.1 School Property

During the Phase I Assessment at Washington Irving Middle School, the following observations were made:

In the paint storage room:

- Approximately 25 five-gallon poly containers and 14 one-gallon steel containers of paint are stacked on the concrete floor or on wooden shelves. Minimal spillage was observed on the concrete floor.

In the former boiler room and in nearby rooms/areas:

- An aged wood cabinet labeled “Flammable Liquids” is present. The interior of the cabinet could not be inspected due to a locked door but no visible staining, evidence of releases, or odors were present on the exterior of the cabinet or surrounding concrete floor.
- An aged wood cabinet in the former boiler room contained various aged unlabeled glass beakers and containers of liquid. White acid-type staining was observed on the wood shelving. The concrete floor beneath the cabinet could not be inspected.
- A sump pump is located in the former boiler room. It is not known if the sump is operable.
- Pipe insulation is present on the boilers. The insulation is labeled as containing asbestos.
- Paint on the ceiling of the former boiler room was observed to be in significantly damaged condition with large amounts of peeling.
- Approximately 150 five-gallon containers of “Bioesque Botanical Disinfectant Solution” are present in storage rooms. The chemical is reportedly biodegradable and not regulated as dangerous goods. No evidence of releases or staining was observed on the containers or in the area.
- Approximately 150-gallons of Hillyard Power-Strip are stored in their original containers and boxes in a storage room. The chemical is reportedly a corrosive liquid and is harmful to aquatic life. No evidence of releases or staining was observed on the containers or in the area.

Shop #1 and Shop #2 (historically metal/paint shops):

- A concrete hazardous materials shed (possibly from the 1960s) is located west of Shop #1 and Shop #2. It has signage that reads “Danger, Flammable Liquids”. The interior of the shed could not be inspected due to locked doors, but no evidence of staining or releases was observed on the exterior of the shed.

2.4.2 Site

LAUSD is proposing the following site improvements:

- Construct a new classroom building, administration building, and M&O building,
- Modernization of the auditorium building,
- Improvements to landscaping and parking

2.5 Discussion of Phase I ESA Items

According to the Phase 1 ESA Report, no RECs were identified in connection with the site.

3.0 SAMPLING ACTIVITIES

The PEA-E field sampling activities presented herein were conducted on May 21 & 22, June 23, and July 21, 2023. The sampling objective was to assess chemicals of potential concern (COPCs) identified for shallow soil at the Site and in areas of concern. The COPCs include lead, arsenic, organochlorine pesticides (OCPs), petroleum hydrocarbons, polycyclic aromatic hydrocarbons (PAHs), and Polychlorinated biphenyls (PCBs). The sampling consisted of the collection of select at-depth soil samples to screen shallow soil for COPCs. Deeper samples were collected in select locations to evaluate risks associated with specific concerns, Field observations of the soil samples did not provide any indications of staining and/or odors.

3.1 Objectives

The objectives of the assessment were to:

- Assess shallow soil for potential environmental concerns identified in the Phase I ESA for the Site,
- Evaluate the presence of asbestos across the Site,
- Evaluate the presence of lead-based paint in planned construction areas by sampling exposed soil,
- Evaluate the presence of arsenic beneath asphalt in planned construction areas by sampling beneath the asphalt,
- Evaluate the presence of chlorinated pesticides across the Site,

- Evaluate the of PAHs across the Site,
- Evaluate the presence of PCBs across the Site,
- Determine if a UST is present and if there are any leaks associated with the UST, and
- Evaluate the overall Site health risk based on soil analytical results.

3.2 Utility Clearance

Prior to conducting intrusive Site activities, Spectrum Geophysical conducted a geophysical survey of the Site to locate detectable utilities and subsurface anomalies. The locations of the utilities were marked, and boring locations were adjusted based on these results.

3.3 Health and Safety Plan

A Site-specific health and safety plan (HASP) was prepared for the field activities. The HASP addressed issues regarding chemical exposure, personal protective equipment (PPE), physical and biological hazards that might be expected at the Site, emergency response plan, and route to the nearest hospital. Site personnel engaged in field activities were required to conduct daily tailgate safety meetings acknowledging the potential health concerns in this plan. Subcontractors were responsible for their own HASP during field activities.

3.4 Field Procedures

Collection of environmental samples of high integrity is important to the quality of chemical data to be generated. To this end, strict field procedures have been developed. General descriptions of field methods that were employed at various locations during various phases of the field investigation are described below.

3.4.1 Sample Collection and Analysis

Soil borings were advanced by CES Group personnel using hand-auger tools. Asphalt or concrete pavement was cored by CES Group as well, prior to advancing the borings. Shallow borings were advanced to a maximum total depth of 5 feet below ground surface (bgs). Deeper borings adjacent to the tank location were advanced to a maximum total depth of 25 feet bgs. All field work was overseen by a California Professional Engineer.

Specific soil sampling approaches are outlined below:

- Discrete soil samples were obtained from 0.5 ft and 2.5 ft bgs depths from 51 borings; 0.5 ft, 2.5 ft, and 5 ft bgs from 10 borings; and 0.5ft, 2.5 ft, 5 ft, 10 ft, 15 ft, 20 ft, and 25 ft bgs from 2 borings. The shallow soil samples were initially analyzed by the laboratory and the remaining samples were held pending the analytical results. Deeper samples were analyzed if warranted based on shallow results. Soil samples were collected in laboratory supplied 8-ounce glass jars or other appropriate containers for the analysis provided by

the laboratory.

- Select samples were analyzed for lead, arsenic, asbestos, PCBs, TPH, PAHs or VOCs based on the location of the boring. Table 1 below shows the sample IDs and the analysis that each sample was submitted for. Analytical results are shown in Tables 2 through 5.
- Select 0.5ft samples were composited in-lab based on their proximity to each other and analyzed for OCPs. Table 1 below show the sample IDs and the analysis that each sample was submitted for. Analytical results are shown in Tables 2 through 5.
- Field duplicate samples were collected during the PEA-E sampling activities at an approximate ratio of 10%. The duplicate sample was collected immediately after the original sample. Due to the heterogeneity of the soil matrix the results for duplicate samples may vary from the results of the original sample. The duplicate samples were analyzed for the same parameters as the original samples collected from the same boring and similar interval.
- Borings were backfilled and compacted with soil and sand. Unpaved areas were filled to the original surface height and paved areas were filled and resurfaced with cement mixed with dye.
- Two samples were collected during a tank investigation at depths of 10 feet and 13 feet 8 inches from the soil adjacent to the suspected tank.

Table 1: Sample Locations, Sample Depths, and Chemical Analyses

Area of Concern	Boring IDs	Soil Sampling Depths (ft, bgs)	Chemical Analysis
<u>Administration Building</u> - Lead-based paint, use of termidicides and herbicides around building footprint, PCBs in caulking of building materials	B1-B13	0.5'	Lead and arsenic 6010B Asbestos by PLM OCPs 8081A (6 composites) 2 samples for: PCBs 8082 Title 22 Metals 6010B/7471A, Hex Chrom 7199, PAHs 8270-SIM

		2.5'	Archive

*Archive- sample was stored at laboratory for possible future analysis if necessary

All samples were sent to a State of California certified environmental laboratory.
Select soil samples were analyzed for the following compounds:

- Arsenic by EPA Method 6010B,
- Lead by EPA Method 6010B,
- Title 22 Metals by 6010B/7471A
- Asbestos (Chrysotile) by PLM,
- OCPs by EPA Method 8081A,

- PCBs by EPA Method 8082,
- PAHs by EPA Method 8270-SIM,
- VOCs by EPA Method 8260B
- GRO C6-C10 by EPA Method 8015M,
- DRO C10-C28 by EPA Method 8015M,
- ORO C28-C44 by EPA Method 8015M,
- Mercury by EPA Method 7471A
- Hexavalent Chromium by 7199

3.4.2 Sample Handling and Storage

In the field, each sample container was marked with their unique sampling location number, date and time of sample collection. Each of the sample containers was wiped with clean paper towels and securely packed and preserved in a cooler on ice, in preparation for delivery to the laboratory.

3.4.3 Sample Custody

An entry was made on a chain-of-custody form supplied by the laboratory for each sample that was submitted to the laboratory for analysis. The information recorded included the sampling date and time, sample identification number, matrix type, requested analyses and methods, preservatives, and the sampler's name. Sampling team members maintained custody of the samples until they were relinquished to laboratory personnel. The cooler was appropriately sealed before it was relinquished to laboratory personnel. The chain-of-custody form accompanied the samples from the time of collection until received by the laboratory. Each party in possession of the samples signed the chain-of-custody form signifying receipt.

Collected soil samples were transported using standard chain-of-custody protocol to Enthalpy Analytical Inc. in Orange, California, a California Certified Laboratory. Upon reception, the laboratory inspected the condition of the sample containers and reported the information on chain-of-custody or similar form.

A copy of the original completed chain-of-custody form was provided by the laboratory along with the report of results. Appendix A contains copies of the laboratory analytical reports.

3.4.4 Equipment Decontamination

Any equipment that came into contact with potentially contaminated soil or water was decontaminated consistently to assure the quality of samples collected. Disposable equipment intended for one-time use was not decontaminated but was packaged for appropriate disposal. Decontamination occurred prior to and after each use of a reusable piece of equipment. The sampling devices used (e.g., hand auger) were decontaminated using the following procedures:

- Non-phosphate detergent and tap water scrub, using a brush if necessary;
- Tap water rinse; and

- Final deionized/distilled water rinse.

3.5 Laboratory Quality Control

The laboratory data package provided includes quality control sample results for blanks, matrix spike/matrix spike duplicates, surrogate recoveries, and laboratory control samples/laboratory control sample duplicates, as specified by the method. The laboratory also provided narrative stating whether or not quality control guidelines were met and listed discrepancies and laboratory data qualifiers. The laboratory reports containing the quality control results are included in Appendix A.

3.6 Abandonment of Soil Borings

Upon completion of sampling, all soil borings were backfilled with clean soil and compacted. Boring locations were resurfaced with concrete dyed black or cold patch asphalt to match existing asphalt hardscape, as applicable.

3.7 Investigation Derived Waste Management

In the process of collecting environmental samples during the PEA-E activities, different types of potentially contaminated Investigation Derived Waste (IDW) were generated that included used PPE, disposable sampling equipment, excess soil cuttings, and decontamination fluids.

Listed below are the procedures that were followed for handling the IDW:

- Used PPE and disposable equipment were double bagged and placed in a municipal refuse dumpster. This waste is not considered hazardous and could be sent to a municipal landfill.

4.0 RESULTS

The observed soil was generally silty sand with some clay and poorly graded sands. The soil was observed to be brown to yellowish brown in color with no chemical odor and no visible signs of staining. Groundwater was not encountered in any of the boreholes during the sampling activities. Duplicate samples showed similar results to the original samples. Field procedures were conducted in compliance with the above procedures. Laboratory procedures were in compliance with the method requirements, including acceptable reporting limits, laboratory selection, and laboratory reporting of quality control information. Acceptable sensitivity was achieved by selecting analytical methods with reporting limits suitable for comparison with action levels. Overall, the dataset is considered to be of acceptable quality. As such, the data set is considered acceptable for use in accessing human health risk at the Site. The following section provides the sample analytical results. Tables showing screening values that were used as points of comparison for the analytical results are also included.

Soil samples were collected from a total of 63 locations during the initial soil sampling on May 20 and 21, 2023. Two additional geoprobe locations were sampled adjacent to the suspected tank on June 23 and two samples were collected from the material

suspected to be within the secondary containment surrounding the tank on July 21. Eleven samples were identified as having elevated concentrations above the LAUSD specified trigger level value of 50 mg/kg for lead. Four of these samples (B5, B11, B32, and B63) exceeded the LAUSD guideline for additional testing of 80 mg/kg. Additional STLC and TCLP tests were run on the four samples and none of the results showed lead concentrations above trigger levels. The deeper samples were also analyzed in these locations and none exceeded the trigger level value of 50 mg/kg. Nine samples were identified as having elevated concentrations above the LAUSD specified limit of 12 mg/kg for arsenic. Additional STLC and TCLP tests were run on 2 samples with some of the highest arsenic concentrations, B12 with 50 mg/kg and B56 with 100 mg/kg, but results did not indicate hazardous levels. The soil collected from the hand auger around the tank (Tank @ 13ft-8in) showed elevated diesel-range hydrocarbons and VOCs.

4.1 Soil Analytical Results

In summary, the soil matrix analytical results indicate the following:

- Lead was detected above the DTSC-modified screening level of 80 mg/kg (screening level for use in human health risk assessments) (DTSC, 2016) in 4 soil samples (B5, B11, B32, and B63). Upon analysis, the deeper samples at these locations at 2.5 ft bgs for B5, B11, B32, and B63 did not show any lead levels above 80 mg/kg. Subsequent STLC and TCLP results indicated non-hazardous levels of lead.
- Arsenic concentrations exceeded the DTSC-adopted background arsenic concentration of 12 mg/kg (DTSC, 2008) in 9 of the samples that were initially analyzed. The maximum concentration detected in the initial 0.5 ft samples was 100 mg/kg in B56. Upon analysis of deeper 2.5 ft samples, none showed concentrations exceeding 12 mg/kg. STLC analysis was conducted in 2 samples and showed non-hazardous arsenic levels.
- Asbestos was detected in 2 samples, B19 and B22 at 0.5 ft.
- OCPs were detected in low levels in 7 of the 0.5 ft composite samples that were analyzed. All OCP concentrations were below the EPA Region 9 Regional Screening Levels (RSLs), with the highest concentration being 0.11 mg/kg of 4,4'-DDE in sample "B12 B13 Comp – 0.5ft".
- PCB concentrations were not detected above the method reporting limit in any of the samples that were analyzed.
- Total petroleum hydrocarbons were detected in 5 samples. B56 in the flammable storage area had an ORO C28-C44 concentration of 60 mg/kg. B57 in the incinerator area had an ORO C28-C44 concentration of 160 mg/kg. B58, which was located adjacent to the oil tank, had an ORO C28-C44 concentration of 200 mg/kg. The samples collected from the tank area showed elevated hydrocarbons and VOCs with maximum diesel-range hydrocarbons of 3400 mg/kg.
- PAHs were detected in low levels in 5 samples (B11, B16, B22D, B35, and

B48) The maximum concentration observed was 110 ug/kg of 1-methylnaphthalene.

Soil analytical results are shown in Tables 2 through 5.

5.0 UST INVESTIGATION

On May 20th, 2023, Spectrum Geophysics conducted a geophysical investigation of the parking lot area adjacent to the Administration Building due to the suspected presence of an underground tank. Spectrum investigated an area that was 35 feet by 100 feet in size. Two significant anomalies were detected during this investigation. One anomaly (A) is rectangular in shape and approximately 17 feet by 12 feet in size. The size and magnitude of the anomaly is typical of those associated with a steel UST. A second anomaly (B) is rectangular in shape and approximately 5 feet by 8 feet in size but was not considered typical of data associated with a UST.

An additional investigation was conducted to determine the nature of the anomalies. ABC Liovin was contracted to conduct an air knife investigation of the subsurface area where Anomaly A was identified. An air knife investigation was only conducted to 5 feet due to the compact nature of the soils. A concrete layer was encountered at 2 feet bgs that was broken open. Hand augering was conducted from 5 feet to 13 feet 8 inches through a slurry and compact sand/silty sand where refusal was met at 13 feet 8 inches. The refusal appeared to be from the top of a possible metal tank. Samples were collected at 10 feet bgs and 13 feet 8 inches. A hydrocarbon odor and staining were observed in the area surrounding the tank. The sampling results confirmed the presence of gasoline, diesel, and oil-range hydrocarbons with the highest concentrations coming from the diesel-range hydrocarbons at 3400 mg/kg in the sample from 13 feet 8 inches. VOCs were also detected in this sample with concentrations ranging from ND to 8.8 mg/kg with the highest concentration coming from naphthalene.

Due to the concrete layer that was observed and the fact that the nearby boring only 8 feet away did not show signs of contamination, it is possible that there is secondary containment surrounding the tank. It is anticipated that there may be piping associated with the UST. The presence of piping was not established during the investigation and its possible location is not known. Care should be exercised during earth moving activities to avoid damage to associated piping.

6.0 HUMAN HEALTH SCREENING EVALUATION

The low concentrations of OCPs, metals, and PAHs detected were below published regulatory screening levels. Lead was detected above 80 mg/kg in 4 soil sample locations (B5, B11, B32, and B36) at a maximum concentration of 190 mg/kg. Arsenic was detected above the DTSC-adopted background arsenic concentration for Southern California of 12 mg/kg (DTSC, 2008) in 9 samples at a maximum concentration of 100 mg/kg. PCBs were not detected above the method reporting limit in any of the samples that were analyzed.

The school site has been defined for both arsenic and lead. All concentrations were below hazardous levels. To further evaluate the maximum detected lead and arsenic

concentrations, the EPA ProUCL software was used to quantify the 95% Upper Confidence Limit (95% UCL) and then the 95% UCL for lead and arsenic were compared to the applicable screening limits. The 95% UCL for lead is 53.61 mg/kg, which is below LAUSD's screening level of 80 mg/kg. The human health risk is typical of similar school Site operations in the State of California for these constituents. None of the soil was determined to be above hazardous levels. The 95% UCL for arsenic is 17.23 mg/kg, which is above LAUSD's screening level of 12 mg/kg. If the soil with the highest concentrations is removed (the concentrations surrounding B10, B12, B31, B47, and B56), then the 95% UCL is reduced to 6.43 mg/kg, which brings the 95% UCL below LAUSD's screening level of 12 mg/kg. CES Group recommends removal of the soil surrounding B10, B12, B31, B47 and B56 to bring the health risk to a level that is similar to school sites in the State of California for these constituents. The deeper samples below 0.5 feet did not indicate elevated levels of arsenic therefore only the shallow soil to 0.5 feet will need to be removed in these areas. A Soil Removal Plan will be prepared to address these concerns.

Asbestos was detected in two soil samples at B19-0.5FT and B-22-0.5FT located near the portables. Asbestos-impacted soil is a health concern if the soil is disturbed. CES Group recommends removal of the shallow soil in these locations prior to any invasive activities.

7.0 COMMUNITY PROFILE

7.1 Community Demographics

A brief summary of the community demographics for the zip code 90065 in Los Angeles County according to the 2021 US American Community Survey (data.census.gov) is as follows:

Total population: 46,432

Male: 23,845

Female: 22,587

Median Age: 37.7

Population 18 years and over: 37,704

Total housing units: 17,135

Population by race:

- One Race: 41,101
- Two or more races: 5,331
- White: 23,511
- Hispanic or Latino: 25,339
- Asian: 8,083
- Black or African American: 1,426

7.2 Local Participation and Involvement

A fact sheet, in the form of a flyer, was produced in English and Spanish (double-sided flyer) to provide members of the community with details regarding the PEA-E investigation including who would perform the work, project schedule, when and where the results of the investigation would be posted, and who to contact regarding additional information. This work notice flyer was handed out to all high school staff, mailed to all parents of students, was distributed to all residences within 500 feet of the school site, and was handed out to all line-of-sight properties, and posted along the boundary fence of the School property.

No specific environmental concerns or issues have been brought to the District's attention regarding the onsite activities at this time. In terms of project visibility, the onsite work took place during the weekend when the school was shut down to minimize any interference with school activities. Line-of-site neighbors, School staff, parents and interested community members were given copies of the work notice flyer. At this time, CES Group is unaware of environmental concerns or issues with relation to neighboring sites.

8.0 OPINION OF ENVIRONMENTAL PROFESSIONAL

Based on the PEA-E sampling results, all areas of impact have been identified and adequately characterized and defined both laterally and vertically. Additional action will be required during grading in the area of the suspected UST. Impacted soil surrounding the UST will require removal along with the removal of the UST and any associated piping that is discovered. A possible concrete secondary containment vessel was identified surrounding the UST. An additional anomaly was identified during the geophysical investigation and care should be exercised in this area as well.

Arsenic impacted soil should be removed in the areas of B1, B12, B47 and B56 to a depth of 0.5 feet. Asbestos-impacted soil in the vicinity of B19 and B-22 should be removed to a depth of 0.5 feet prior to invasive activities in the portables area. A Soil Removal Plan will be prepared to outline the procedures and requirements for soil removal.

9.0 CONCLUSIONS AND RECOMMENDATIONS

The primary objectives of this PEA-E were to assess shallow soil for potential environmental concerns identified in the Phase I ESA for the Site and to evaluate the overall Site health risk based on soil analytical screening results for COPCs (lead, arsenic, asbestos, OCPs, PCBs, TPH, and PAHs).

The soil analytical results indicate that lead and arsenic were detected in all of the original 0.5 ft soil samples that were analyzed. Lead was detected above the DTSC-modified screening level of 80 mg/kg in 4 original soil samples (B5, B11, B32, and B63). Deeper samples were analyzed in these locations and results were below screening levels. Lead was detected above the trigger level value of 50 mg/kg in 11 of the original samples. STLC and TCLP analyses indicated non-hazardous levels in all samples. Arsenic exceeded the DTSC-adopted background arsenic concentration of 12 mg/kg in 9

of the original samples. Three samples exceeded the trigger level value of 50 mg/kg and subsequent STLC analysis indicated non-hazardous concentrations. PCBs were not detected above the method reporting limit in any of the samples that were analyzed. Low-level OCPs were detected in several composite samples but concentrations were well below the EPA Regional Screening Levels (RSLs). Low-level PAHs were identified in several samples, but concentrations were well below RSLs.

To further evaluate the maximum detected lead and arsenic concentrations, the EPA ProUCL software was used to quantify the 95% Upper Confidence Limit (95% UCL) and then the 95% UCL for lead and arsenic were compared to the applicable screening limits. The 95% UCL for lead is 53.61 mg/kg, which is below LAUSD's screening level of 80 mg/kg. The human health risk is typical of similar school Site operations in the State of California for these constituents. None of the soil was determined to be above hazardous levels. The 95% UCL for arsenic is 17.23 mg/kg, which is above LAUSD's screening level of 12 mg/kg. If the soil with the highest concentrations is removed (the concentrations surrounding B10, B12, B31, B47, and B56), then the 95% UCL is reduced to 6.43 mg/kg, which brings the 95% UCL below LAUSD's screening level of 12 mg/kg. CES Group recommends removal of the soil surrounding B10, B12, B31, B47 and B56 to bring the health risk to a level that is similar to school sites in the State of California for these constituents. The deeper samples below 0.5 feet did not indicate elevated levels of arsenic therefore only the shallow soil to 0.5 feet will need to be removed in these areas. A Soil Removal Plan will be prepared to address these concerns.

Asbestos was detected in two soil samples at B19-0.5FT and B-22-0.5FT located near the portables. Asbestos-impacted soil is a health concern if the soil is disturbed. CES Group recommends removal of the shallow soil in these areas prior to any invasive activities. The removal of the asbestos-impacted soil will be addressed in the Soil Removal Plan.

A geophysical survey of the suspected UST area was conducted and 2 anomalies were located. Anomaly A was identified as rectangular in shape and approximately 17 feet by 12 feet in size and indicative of a steel UST. Anomaly B is rectangular in shape and approximately 5 feet by 8 feet in size but was not considered typical of data associated with a UST. Further investigation of Anomaly A revealed a concrete layer at 2 feet bgs and the top of a suspected tank at 13 feet 8 inches bgs. Impacted soil was observed in the area surrounding the tank with concentrations of diesel-range hydrocarbons of 3400 mg/kg and impacts due to VOCs ranging from ND to 8.8 mg/kg with the highest concentration coming from naphthalene. The concrete layer may be secondary containment for the tank. Impacted soil surrounding the UST will require removal during grading activities along with the removal of the UST. Associated piping may be present in the area of the UST and care should be exercised to avoid damage to such piping. A Soil Removal Plan will be prepared to address the removal of the UST, associated piping, and surrounding impacted soil.

10.0 LIMITATIONS

The services described in this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. Opinions, conclusions, and recommendations contained in this report apply to

conditions existing when the services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. Where subsurface exploratory work, monitoring, and/or testing was performed, our professional opinions and conclusions are based in part on interpretation of data from discrete sampling or measurement locations that may not represent actual conditions at un-sampled or un-measured locations. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of the services. We assume no responsibility for conditions we were not authorized to evaluate, or conditions not generally recognized as predictable when the services were performed. We do not warrant the accuracy of information supplied by others, or the use of segregated portions of this report.

This document is intended to be used only in its entirety. No portion of the document, by itself, is designed to completely represent any aspect of the project described herein. CES Group should be contacted if the reader requires any additional information, or has questions regarding content, interpretations presented, or completeness of this document.

CES Group's professional opinions and recommendations regarding environmental conditions, as presented in this report, are based on limited subsurface assessment and chemical analyses data. Further assessment of potential adverse environmental impacts from past on-Site and/or nearby use of hazardous materials may be accomplished by a more comprehensive assessment. The samples collected and used for testing, and the observations made, are believed to be representative of the area(s) evaluated; however, conditions can vary significantly between and beyond the sampling locations. Variations in soil conditions likely exist beyond the points explored in this assessment and related excavation.

Notes:
mg/kg = milligrams per kilogram
mg/L = milligrams per liter

*Naphth 8.8, Ethylbenz 0.28, xyl 0.99, 1,2,4-TMB 4.5, see lab report for others
NA = not analyzed
For soil reuse, arsenic <12.0 mg/kg, lead <80 mg/kg.
Regional Screening Level (RSL) Summary Table May 2023
J = Reported value is estimated

123 = Equals or Exceeds LAUSD limit
ND = not detected
For soil reuse, Hex Chrome concentrations must be less than 15 mg/kg
HERO - Note 3: Table 1. DTSC Recommended Screening Levels for Soil - 2022
NA* = not analyzed due to duplicate sample

92592	Date	05/23/23
Skye Greene	Received:	

- This data package contains sample and QC results for five soil samples and two two-point soil composites, requested for the above referenced project on 05/23/23. The samples were received cold and intact.
- Supplemental Report 1 - Additional analyses requested on 06/08/23 are now reported.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

- B61-0.5FT (lab # 485621-003) was diluted due to the dark color of the sample extract.
- No other analytical problems were encountered.

Pesticides (EPA 8081A):

- B60-0.5FT, B61-0.5FT COMPOSITE (lab # 485621-005) and B62-0.5FT, B63-0.5FT COMPOSITE (lab # 485621-010) were diluted due to the color of the sample extracts.
- No other analytical problems were encountered.

PCBs (EPA 8082):

- B61-0.5FT (lab # 485621-003) was diluted due to the color of the sample extract.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A) Soil:

- High response was observed for thallium in the ICV analyzed 06/13/23 09:20; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 18:13; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 18:54; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 19:35; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 20:14; affected data was qualified with "b".
- Low recoveries were observed for antimony in the MS/MSD of B60-0.5FT (lab # 485621-001); the LCS was within limits, and the associated RPD was within limits. High recoveries were observed for lead and zinc in the MSD of B60-0.5FT (lab # 485621-001); the LCS was within limits. High RPD was also observed for lead and zinc in the MS/MSD of B60-0.5FT (lab # 485621-001).
- No other analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):

AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

ENTHALPY

SAMPLE ACCEPTANCE CHECKLIST

Section 1
 Client: CES Group Project: Invis MS
 Date Received: 5/23/23 Sampler's Name Present: Yes No

Section 2
 Sample(s) received in a cooler? Yes, How many? 1 No (skip section 2) Sample Temp (°C) (No Cooler) : _____
 Sample Temp (°C), One from each cooler: #1: 2.0 #2: _____ #3: _____ #4: _____
(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)
 Shipping Information: _____

Section 3
 Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam
 Paper None Other _____
 Cooler Temp (°C): #1: 1.7 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?			
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

Section 5 Explanations/Comments

Section 6
 For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____
 Email (email sent to/on): _____ / _____
 Project Manager's response:

Completed By: [Signature] Date: 5/23/23

Ranjit,

Can we run the following additional analyses for the Irving Middle School project...

B5-0.5' – Arsenic 13 mg/kg, Lead 190 mg/kg – Run STLC and TCLP for lead on B5-0.5ft, Run B5-2.5ft for lead and arsenic

B7-0.5' – Lead 73 mg/kg – Run STLC for lead on B7-0.5ft

B11-0.5' – lead 170 mg/kg, Arsenic 12 mg/kg, low level PAHs – Run STLC and TCLP for lead on B11-0.5ft, Run B11-2.5ft for lead and arsenic

B12-0.5' – Lead 61 mg/kg, Arsenic 50 mg/kg – Run STLC for lead and As on B12-0.5ft, Run B12-2.5ft for lead and arsenic

B13-0.5' – Arsenic 12 mg/kg – Run B13-2.5ft for Arsenic

B19-0.5' – Asbestos present – Quantify Asbestos – Run B19-2.5ft for Asbestos (Quantify if present)

B-22-0.5' – Asbestos present – Quantify Asbestos – Run B-22-2.5ft for Asbestos (Quantify if present)

B31-0.5' – Arsenic 52 mg/kg – Run STLC for As on B31-0.5ft, Run B31-2.5ft for Arsenic

B32-0.5' – Lead 190 mg/kg – Run STLC and TCLP on B32-0.5ft, Run B32-2.5ft for lead

B47-0.5' – Lead 55 mg/kg, Arsenic 15 mg/kg – Run STLC for lead on B47-0.5ft, Run B47-2.5ft for lead and arsenic

B48-0.5' – Arsenic 13 mg/kg, low level PAHs – Run B48-2.5ft for Arsenic

B56-0.5' – Arsenic 100 mg/kg, ORO 20 mg/kg Run STLC and TCLP for arsenic on B56-0.5ft, run B56-2.5ft for arsenic

B60-0.5' – Lead 60 mg/kg – Run STLC for lead on B60-0.5ft

B62-0.5' – Lead 62 mg/kg – Run STLC for lead on B62-0.5ft

B63-0.5' – Lead 91 mg/kg – Run STLC for lead on B63-0.5ft, Run B63-2.5ft for lead

Analyzed by: Lateef McIntosh

Reviewed by: Lateef McIntosh

Date: 6/1/2023

Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represent Qualitative PLM (polarized light microscopy) or Qualitative TEM (transmission electron microscopy) Analysis for confirmation of asbestos presence and identification only, following selections of EPA 600/R-93/116 (method not covered by NVLAP asbestos accreditation); NA = not analyzed; this report relates ONLY to the items tested.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter.

Case Narrative

CES Group, Inc.
33175 Temecula Pkwy
Ste. A-734
Temecula, CA 92592
Skye Greene

Lab Job Number: 485622
Project No: IRVING MS
Location: 3010 Estara Ave., Los Angeles, CA 90065
Date Received: 05/23/23

This data package contains sample and QC results for nine soil samples, three two-point soil composites, and one three-point soil composite, requested for the above referenced project on 05/23/23. The samples were received cold and intact.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

- B43-0.5FT (lab # 485622-023) was diluted due to the dark and viscous nature of the sample extract.
- No other analytical problems were encountered.

Pesticides (EPA 8081A):

- High recoveries were observed for methoxychlor in the MS/MSD of B37-0.5FT, B39-0.5FT COMPOSITE (lab # 485622-017); the LCS was within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples.
- A number of samples were diluted due to the color of the sample extracts.
- No other analytical problems were encountered.

PCBs (EPA 8082):

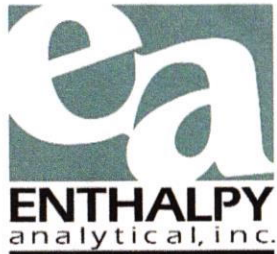

- B43-0.5FT (lab # 485622-023) was diluted due to the color of the sample extract.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A):

- High response was observed for thallium in the CCV analyzed 05/25/23 23:32; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 22:53; affected data was qualified with "b".
- Low recoveries were observed for antimony in the MS/MSD of B1-0.5FT (lab # 485650-001); the LCS was within limits, and the associated RPD was within limits. High recovery was observed for lead in the MSD of B1-0.5FT (lab # 485650-001); the LCS was within limits. High RPD was also observed for lead in the MS/MSD of B1-0.5FT (lab # 485650-001).
- Low recoveries were observed for antimony in the MS/MSD of B38-0.5FT (lab # 485622-018); the LCS was within limits, and the associated RPD was within limits. High recovery was observed for barium in the MSD of B38-0.5FT (lab # 485622-018); the LCS was within limits. High RPD was also observed for barium in the MS/MSD of B38-0.5FT (lab # 485622-018).
- No other analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):

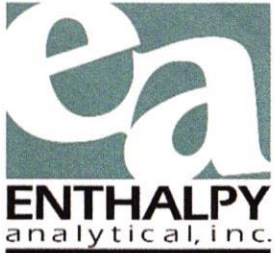

AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

Analyzed by: Lateef McIntosh

Reviewed by: Lateef McIntosh

Date: 6/5/2023

Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represent Qualitative PLM (polarized light microscopy) or Qualitative TEM (transmission electron microscopy) Analysis for confirmation of asbestos presence and identification only, following selections of EPA 600/R-93/116 (method not covered by NVLAP asbestos accreditation); NA = not analyzed; this report relates ONLY to the items tested.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter.

Skye Greene	Received:	

- This data package contains sample and QC results for three soil samples, requested for the above referenced project on 05/23/23. The samples were received cold and intact.
- Supplemental Report 1 - Additional analyses requested on 06/08/23 are now reported.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):

No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015M):

- B57-0.5FT (lab # 485626-004) was diluted due to the dark color of the sample extract.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

No analytical problems were encountered.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

- High RPD was observed for naphthalene in the MS/MSD for batch 314640; the parent sample was not a project sample, and this analyte was not detected at or above the RL in the associated sample.
- B57-0.5FT (lab # 485626-004) was diluted due to the dark and viscous nature of the sample extract.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A) Soil:

- High responses were observed for selenium and thallium in the CCV analyzed 05/25/23 12:07; affected data was qualified with "b".
- High responses were observed for selenium and thallium in the CCV analyzed 05/25/23 11:28; affected data was qualified with "b".
- High recovery was observed for thallium in the LCS for batch 314705; this analyte was not detected at or above the RL in the associated samples.
- Low recoveries were observed for antimony in the MS/MSD for batch 314705; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

Metals (EPA 6010B) TCLP Leachate:

No analytical problems were encountered.

Metals (EPA 6010B) WET Leachate:

No analytical problems were encountered.

Hexavalent Chromium by Ion Chromatograph (EPA 7199):

No analytical problems were encountered.

Dioxin & Furans by EPA 8290 (EPA 8290):

Ceres in El Dorado Hills, CA performed the analysis (see sublab report section for certifications). Please see the Ceres case narrative.

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: CES Group, Inc. Project: Irving MS CES030223A

Date Received: 5/23/23 Sampler's Name Present: Yes No

Section 2

Sample(s) received in a cooler? Yes, How many? 1 No (skip section 2) Sample Temp (°C) (No Cooler) : _____

Sample Temp (°C), One from each cooler: #1: 2.0 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam

Paper None Other _____

Cooler Temp (°C): #1: 1.7 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?	<input checked="" type="checkbox"/>		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

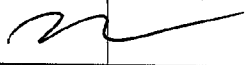

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____

Email (email sent to/on): _____ / _____

Project Manager's response: _____

Completed By:  Date: 5-23-23

Ranjit,

Can we run the following additional analyses for the Irving Middle School project...

B5-0.5' – Arsenic 13 mg/kg, Lead 190 mg/kg – Run STLC and TCLP for lead on B5-0.5ft, Run B5-2.5ft for lead and arsenic

B7-0.5' – Lead 73 mg/kg – Run STLC for lead on B7-0.5ft

B11-0.5' – lead 170 mg/kg, Arsenic 12 mg/kg, low level PAHs – Run STLC and TCLP for lead on B11-0.5ft, Run B11-2.5ft for lead and arsenic

B12-0.5' – Lead 61 mg/kg, Arsenic 50 mg/kg – Run STLC for lead and As on B12-0.5ft, Run B12-2.5ft for lead and arsenic

B13-0.5' – Arsenic 12 mg/kg – Run B13-2.5ft for Arsenic

B19-0.5' – Asbestos present – Quantify Asbestos – Run B19-2.5ft for Asbestos (Quantify if present)

B-22-0.5' – Asbestos present – Quantify Asbestos – Run B-22-2.5ft for Asbestos (Quantify if present)

B31-0.5' – Arsenic 52 mg/kg – Run STLC for As on B31-0.5ft, Run B31-2.5ft for Arsenic

B32-0.5' – Lead 190 mg/kg – Run STLC and TCLP on B32-0.5ft, Run B32-2.5ft for lead

B47-0.5' – Lead 55 mg/kg, Arsenic 15 mg/kg – Run STLC for lead on B47-0.5ft, Run B47-2.5ft for lead and arsenic

B48-0.5' – Arsenic 13 mg/kg, low level PAHs – Run B48-2.5ft for Arsenic

B56-0.5' – Arsenic 100 mg/kg, ORO 20 mg/kg Run STLC and TCLP for arsenic on B56-0.5ft, run B56-2.5ft for arsenic

B60-0.5' – Lead 60 mg/kg – Run STLC for lead on B60-0.5ft

B62-0.5' – Lead 62 mg/kg – Run STLC for lead on B62-0.5ft

B63-0.5' – Lead 91 mg/kg – Run STLC for lead on B63-0.5ft, Run B63-2.5ft for lead

Ceres

CERES Analytical Laboratory, Inc.

4919 Windplay Dr, Suite 1, El Dorado Hills, CA 95762

June 5, 2023

Ceres ID: 16405

Enthalpy Analytical, Inc.
931 W. Barkley Ave.
Orange, CA 92868

The following report contains the results for the one soil sample received on May 25, 2023. This sample was analyzed for tetra through octa chlorinated dioxins and dibenzofurans by EPA method 8290. Routine turn-around time was provided for this work.

This work was authorized under Enthalpy Order #: EO-485626, and PO# 046592.

Continuing Calibration Verification (CCV) Requirements

All associated calibration verification standard(s) (CCV) met the acceptance criteria.

The report consists of a Cover Letter, Sample Inventory (Section I), Data Summary (Section II), Sample Tracking (Section VI), and Qualifiers/Abbreviations (Section VII). Raw Data (Section III), Continuing Calibration (Section IV), and Initial Calibration (Section V) are available in a full report (.pdf format) upon request.

If you have any questions regarding this report, please feel free to contact me at (916)932-5011.

Sincerely,

James M. Hedin
Director of Operations/CEO
jhedin@ceres-lab.com

J	Concentration found below the lower quantitation limit but greater than zero.
B	Analyte present in the associated Method Blank.
E	Concentration found exceeds the Calibration range of the HRGC/HRMS.
D	This analyte concentration was calculated from a dilution.
X	The concentration found is the estimated maximum possible concentration due to chlorinated diphenyl ethers present in the sample.
H	Recovery limits exceeded. See cover letter.
*	Results taken from dilution.
I	Interference. See cover letter.
Conc.	Concentration Found
DL	Calculated Detection Limit
ND	Non-Detect
% Rec.	Percent Recovery

Case Narrative

CES Group, Inc.
33175 Temecula Pkwy
Ste. A-734
Temecula, CA 92592
Skye Greene

Lab Job Number: 485627
Project No: IRVING MS
Location: 3010 Estara Ave., Los Angeles, CA 90065
Date Received: 05/23/23

This data package contains sample and QC results for eleven soil samples and five two-point soil composites, requested for the above referenced project on 05/23/23. The samples were received cold and intact.

Pesticides (EPA 8081A):

- High recoveries were observed for methoxychlor in the MS/MSD of B37-0.5FT, B39-0.5FT COMPOSITE (lab # 485622-017); the LCS was within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples.
- B14-0.5FT, B15-0.5FT COMP (lab # 485627-005), B20-0.5FT, B21-0.5FT COMP (lab # 485627-020), and B22-0.5FT, B23-0.5FT COMP (lab # 485627-025) were diluted due to the color of the sample extracts.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A):

- High responses were observed for selenium and thallium in the CCV analyzed 05/25/23 11:28; affected data was qualified with "b".
- High responses were observed for selenium and thallium in the CCV analyzed 05/25/23 12:07; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 18:54; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 19:35; affected data was qualified with "b".
- High recovery was observed for thallium in the LCS for batch 314705; this analyte was not detected at or above the RL in the associated samples.
- Low recoveries were observed for antimony in the MS/MSD for batch 314705; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- Low recoveries were observed for antimony in the MS/MSD for batch 314748; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- High recovery was observed for lead in the MS of B60-0.5FT (lab # 485621-001); the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):

AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1
 Client: CES Group Project: Irving MS
 Date Received: 5/23/23 Sampler's Name Present: Yes No

Section 2
 Sample(s) received in a cooler? Yes, How many? 1 No (skip section 2) Sample Temp (°C) (No Cooler) : _____
 Sample Temp (°C), One from each cooler: #1: 4.0 #2: _____ #3: _____ #4: _____
(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)
 Shipping Information: _____

Section 3
 Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam
 Paper None Other _____
 Cooler Temp (°C): #1: 2.3 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?			<input checked="" type="checkbox"/>
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

Section 5 Explanations/Comments

Section 6
 For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____
 Email (email sent to/on): _____ / _____
 Project Manager's response:

Completed By: *Olivia Sylvestre* Date: 5/23/23

Analyzed by: Megan A DeLara
 Date: 6/1/2023

Reviewed by: Patricia Weakley

Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represent Qualitative PLM (polarized light microscopy) or Qualitative TEM (transmission electron microscopy) Analysis for confirmation of asbestos presence and identification only, following selections of EPA 600/R-93/116 (method not covered by NVLAP asbestos accreditation); NA = not analyzed; this report relates ONLY to the items tested.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter.

Case Narrative

CES Group, Inc.	Lab Job	485629
33175 Temecula	Number:	
Pkwy	Project No:	IRVING MS
Ste. A-734	Location:	3010 Estara Ave., Los Angeles, CA 90065 - Supplemental
Temecula, CA	Report	1
92592	Date	05/23/23
Skye Greene	Received:	

- This data package contains sample and QC results for eight soil samples, one three-point soil composite, and one two-point soil composite, requested for the above referenced project on 05/23/23. The samples were received cold and intact.
- Supplemental Report 1 - Additional analyses requested on 06/08/23 are now reported.

Pesticides (EPA 8081A):

- High recoveries were observed for methoxychlor in the MS/MSD of B37-0.5FT, B39-0.5FT COMPOSITE (lab # 485622-017); the LCS was within limits, the associated RPD was within limits, and this analyte was not detected at or above the RL in the associated samples.
- B46-0.5FT, B47-0.5FT, B48-0.5FT COMPOSITE (lab # 485629-013) was diluted due to the color of the sample extract.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A) Soil:

- High response was observed for thallium in the ICV analyzed 06/13/23 09:20; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 23:32; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 22:53; affected data was qualified with "b".
- Low recoveries were observed for antimony in the MS/MSD of B38-0.5FT (lab # 485622-018); the LCS was within limits, and the associated RPD was within limits. High recovery was observed for barium in the MSD of B38-0.5FT (lab # 485622-018); the LCS was within limits. High RPD was also observed for barium in the MS/MSD of B38-0.5FT (lab # 485622-018).
- No other analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):

AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: CES Group, Inc. Project: Irving MS CES030223A

Date Received: 5/23/23 Sampler's Name Present: Yes No

Section 2

Sample(s) received in a cooler? Yes, How many? 1 No (skip section 2) Sample Temp (°C) (No Cooler) : _____

Sample Temp (°C), One from each cooler: #1: 2.0 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam
 Paper None Other _____

Cooler Temp (°C): #1: 1.7 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?			<input checked="" type="checkbox"/>
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____
 Email (email sent to/on): _____ / _____

Project Manager's response: _____

Completed By: [Signature] Date: 5-23-23

Ranjit,

Can we run the following additional analyses for the Irving Middle School project...

B5-0.5' – Arsenic 13 mg/kg, Lead 190 mg/kg – Run STLC and TCLP for lead on B5-0.5ft, Run B5-2.5ft for lead and arsenic

B7-0.5' – Lead 73 mg/kg – Run STLC for lead on B7-0.5ft

B11-0.5' – lead 170 mg/kg, Arsenic 12 mg/kg, low level PAHs – Run STLC and TCLP for lead on B11-0.5ft, Run B11-2.5ft for lead and arsenic

B12-0.5' – Lead 61 mg/kg, Arsenic 50 mg/kg – Run STLC for lead and As on B12-0.5ft, Run B12-2.5ft for lead and arsenic

B13-0.5' – Arsenic 12 mg/kg – Run B13-2.5ft for Arsenic

B19-0.5' – Asbestos present – Quantify Asbestos – Run B19-2.5ft for Asbestos (Quantify if present)

B-22-0.5' – Asbestos present – Quantify Asbestos – Run B-22-2.5ft for Asbestos (Quantify if present)

B31-0.5' – Arsenic 52 mg/kg – Run STLC for As on B31-0.5ft, Run B31-2.5ft for Arsenic

B32-0.5' – Lead 190 mg/kg – Run STLC and TCLP on B32-0.5ft, Run B32-2.5ft for lead

B47-0.5' – Lead 55 mg/kg, Arsenic 15 mg/kg – Run STLC for lead on B47-0.5ft, Run B47-2.5ft for lead and arsenic

B48-0.5' – Arsenic 13 mg/kg, low level PAHs – Run B48-2.5ft for Arsenic

B56-0.5' – Arsenic 100 mg/kg, ORO 20 mg/kg Run STLC and TCLP for arsenic on B56-0.5ft, run B56-2.5ft for arsenic

B60-0.5' – Lead 60 mg/kg – Run STLC for lead on B60-0.5ft

B62-0.5' – Lead 62 mg/kg – Run STLC for lead on B62-0.5ft

B63-0.5' – Lead 91 mg/kg – Run STLC for lead on B63-0.5ft, Run B63-2.5ft for lead

Analyzed by: Patricia Weakley

Reviewed by: Lateef McIntosh

Date: 6/1/2023

Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represent Qualitative PLM (polarized light microscopy) or Qualitative TEM (transmission electron microscopy) Analysis for confirmation of asbestos presence and identification only, following selections of EPA 600/R-93/116 (method not covered by NVLAP asbestos accreditation); NA = not analyzed; this report relates ONLY to the items tested.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter.

Case Narrative

CES Group, Inc.	Lab Job	485638
33175 Temecula	Number:	
Pkwy	Project No:	IRVING MS
Ste. A-734	Location:	3010 Estara Ave., Los Angeles, CA 90065 - Supplemental
Temecula, CA	Report 1	
92592	Date	05/23/23
Skye Greene	Received:	

- This data package contains sample and QC results for fifteen soil samples, four two-point soil composites, and one three-point soil composite, requested for the above referenced project on 05/23/23. The samples were received cold and intact.
- Supplemental Report 1 - Additional analyses requested on 06/08/23 are now reported.

Pesticides (EPA 8081A):

- High recovery was observed for endrin in the LCS for batch 314891; this analyte was not detected at or above the RL in the associated samples.
- High recoveries were observed for a number of analytes in the MS/MSD of B24-0.5FT, B25-0.5FT COMPOSITE (lab # 485638-005); the associated RPDs were within limits, and these analytes were not detected at or above the RL in the associated samples.
- B26-0.5FT, B27-0.5FT COMPOSITE (lab # 485638-010) was diluted due to the color of the sample extract.
- No other analytical problems were encountered.

PCBs (EPA 8082):

- High surrogate recovery was observed for decachlorobiphenyl (PCB) in B31-0.5FT (lab # 485638-018); no target analytes were detected in the sample.
- B31-0.5FT (lab # 485638-018) was diluted due to the color of the sample extract.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A) Soil:

- High response was observed for thallium in the ICV analyzed 06/13/23 09:20; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 23:32; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/25/23 22:53; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/26/23 02:08; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/26/23 02:47; affected data was qualified with "b".
- High response was observed for thallium in the CCV analyzed 05/26/23 03:26; affected data was qualified with "b".
- Low recoveries were observed for antimony in the MS/MSD of B38-0.5FT (lab # 485622-018); the LCS was within limits, and the associated RPD was within limits. High recovery was observed for barium in the MSD of B38-0.5FT (lab # 485622-018); the LCS was within limits. High RPD was also observed for barium in the MS/MSD of B38-0.5FT (lab # 485622-018).
- No other analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):

AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1	
Client: <u>CES Group, Inc.</u>	Project: <u>Irving MS CES030223A</u>
Date Received: <u>5/23/23</u>	Sampler's Name Present: <input checked="" type="checkbox"/> Yes <input type="checkbox"/> No

Section 2	
Sample(s) received in a cooler? <input checked="" type="checkbox"/> Yes, How many? <u>1</u> <input type="checkbox"/> No (skip section 2)	Sample Temp (°C) (No Cooler) : _____
Sample Temp (°C), One from each cooler: #1: <u>3.5</u> #2: _____ #3: _____ #4: _____	
<i>(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)</i>	
Shipping Information: _____	

Section 3	
Was the cooler packed with:	<input checked="" type="checkbox"/> Ice <input type="checkbox"/> Ice Packs <input type="checkbox"/> Bubble Wrap <input type="checkbox"/> Styrofoam
	<input type="checkbox"/> Paper <input type="checkbox"/> None <input type="checkbox"/> Other _____
Cooler Temp (°C): #1: <u>1.4</u> #2: _____ #3: _____ #4: _____	

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?			<input checked="" type="checkbox"/>
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

Section 5 Explanations/Comments	
--	--

Section 6	
For discrepancies, how was the Project Manager notified? <input type="checkbox"/> Verbal PM Initials: _____ Date/Time _____	<input type="checkbox"/> Email (email sent to/on): _____ / _____
Project Manager's response: _____

Ranjit,

Can we run the following additional analyses for the Irving Middle School project...

B5-0.5' – Arsenic 13 mg/kg, Lead 190 mg/kg – Run STLC and TCLP for lead on B5-0.5ft, Run B5-2.5ft for lead and arsenic

B7-0.5' – Lead 73 mg/kg – Run STLC for lead on B7-0.5ft

B11-0.5' – lead 170 mg/kg, Arsenic 12 mg/kg, low level PAHs – Run STLC and TCLP for lead on B11-0.5ft, Run B11-2.5ft for lead and arsenic

B12-0.5' – Lead 61 mg/kg, Arsenic 50 mg/kg – Run STLC for lead and As on B12-0.5ft, Run B12-2.5ft for lead and arsenic

B13-0.5' – Arsenic 12 mg/kg – Run B13-2.5ft for Arsenic

B19-0.5' – Asbestos present – Quantify Asbestos – Run B19-2.5ft for Asbestos (Quantify if present)

B-22-0.5' – Asbestos present – Quantify Asbestos – Run B-22-2.5ft for Asbestos (Quantify if present)

B31-0.5' – Arsenic 52 mg/kg – Run STLC for As on B31-0.5ft, Run B31-2.5ft for Arsenic

B32-0.5' – Lead 190 mg/kg – Run STLC and TCLP on B32-0.5ft, Run B32-2.5ft for lead

B47-0.5' – Lead 55 mg/kg, Arsenic 15 mg/kg – Run STLC for lead on B47-0.5ft, Run B47-2.5ft for lead and arsenic

B48-0.5' – Arsenic 13 mg/kg, low level PAHs – Run B48-2.5ft for Arsenic

B56-0.5' – Arsenic 100 mg/kg, ORO 20 mg/kg Run STLC and TCLP for arsenic on B56-0.5ft, run B56-2.5ft for arsenic

B60-0.5' – Lead 60 mg/kg – Run STLC for lead on B60-0.5ft

B62-0.5' – Lead 62 mg/kg – Run STLC for lead on B62-0.5ft

B63-0.5' – Lead 91 mg/kg – Run STLC for lead on B63-0.5ft, Run B63-2.5ft for lead

Reporting Notes:

Analyzed by: Patricia Weakley
Date: 5/30/2023

Reviewed by: Megan A DeLara

*NAD = no asbestos detected; Detection Limit <1%; Reporting Limits: CVES = 1%, 400 Pt Ct = 0.25%, 1000 Pt Ct = 0.1%; NA = not analyzed; NA/PS = not analyzed / positive stop; NVA = No Visible Asbestos; PLM (polarized light microscopy) Bulk Asbestos Analysis by EPA 600/R-93/116, including requirements for EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab #200346-0); Note: PLM is not consistently reliable in detecting asbestos in floor coverings and similar NOB materials. TEM is currently the only method that can be used to determine if this material can be considered or treated as non-asbestos-containing in New York State (also see EPA Advisory for floor tile, FR 59, 146, 38970, 8/1/94). NIST Accreditation requirements mandate that this report must not be reproduced except in full with the approval of the laboratory. This PLM report relates ONLY to the items tested.

Case Narrative

CES Group, Inc.	Lab Job	485650
33175 Temecula	Number:	
Pkwy	Project No:	IRVING MS
Ste. A-734	Location:	3010 Estara Ave., Los Angeles, CA 90065 - Supplemental
Temecula, CA	Report 1	
92592	Date	05/23/23
Skye Greene	Received:	

- This data package contains sample and QC results for twenty soil samples, five two-point soil composites, and one three-point soil composite, requested for the above referenced project on 05/23/23. The samples were received cold and intact.
- Supplemental Report 1 - The additional analyses requested on 06/08/23 are now included.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

- High RPD was observed for naphthalene in the MS/MSD for batch 314640; the parent sample was not a project sample, and this analyte was not detected at or above the RL in the associated samples.
- B5-0.5FT (lab # 485650-010) was diluted due to the dark color of the sample extract.
- No other analytical problems were encountered.

Pesticides (EPA 8081A):

- High recovery was observed for endrin in the LCS for batch 314891; this analyte was not detected at or above the RL in the associated samples.
- High recoveries were observed for a number of analytes in the MS/MSD of B24-0.5FT, B25-0.5FT COMPOSITE (lab # 485638-005); the associated RPDs were within limits.
- High surrogate recovery was observed for decachlorobiphenyl in B10-0.5FT, B11-0.5FT COMPOSITE (lab # 485650-027); the corresponding TCMX surrogate recovery was within limits.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A) Soil:

- High response was observed for thallium in the ICV analyzed 06/13/23 09:20; affected data was qualified with "b".
- High responses were observed for selenium and thallium in the CCV analyzed 05/25/23 11:28; affected data was qualified with "b".
- High responses were observed for selenium and thallium in the CCV analyzed 05/25/23 12:07; affected data was qualified with "b".
- Low recoveries were observed for antimony in the MS/MSD of B1-0.5FT (lab # 485650-001); the LCS was within limits, and the associated RPD was within limits. High recovery was observed for lead in the MSD of B1-0.5FT (lab # 485650-001); the LCS was within limits. High RPD was also observed for lead in the MS/MSD of B1-0.5FT (lab # 485650-001).
- Nickel was detected above the RL in the method blank for batch 314699; this analyte was detected in samples at a level at least 10 times that of the blank.
- No other analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):

AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

ENTHALPY ANALYTICAL

SAMPLE ACCEPTANCE CHECKLIST

Section 1

Client: CES Group, Inc. Project: Irving MS CES030223A

Date Received: 5/23/23 Sampler's Name Present: Yes No

Section 2

Sample(s) received in a cooler? Yes, How many? 1 NO (skip section 2) Sample Temp (°C) (No Cooler) : _____

Sample Temp (°C), One from each cooler: #1: 2.5 #2: _____ #3: _____ #4: _____

(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)

Shipping Information: _____

Section 3

Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam

Paper None Other _____

Cooler Temp (°C): #1: 1.3 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?			<input checked="" type="checkbox"/>
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

Section 5 Explanations/Comments

Section 6

For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____

Email (email sent to/on): _____ / _____

Project Manager's response: _____

Completed By: [Signature] Date: 5-23-23

Cc: Danny Baysa <dbaysa@cesgroup.co>, "jbaysa.cesgroup" <jbaysa.cesgroup@gmail.com>

Ranjit,

Can we run the following additional analyses for the Irving Middle School project...

B5-0.5' – Arsenic 13 mg/kg, Lead 190 mg/kg – Run STLC and TCLP for lead on B5-0.5ft, Run B5-2.5ft for lead and arsenic

B7-0.5' – Lead 73 mg/kg – Run STLC for lead on B7-0.5ft

B11-0.5' – lead 170 mg/kg, Arsenic 12 mg/kg, low level PAHs – Run STLC and TCLP for lead on B11-0.5ft, Run B11-2.5ft for lead and arsenic

B12-0.5' – Lead 61 mg/kg, Arsenic 50 mg/kg – Run STLC for lead and As on B12-0.5ft, Run B12-2.5ft for lead and arsenic

B13-0.5' – Arsenic 12 mg/kg – Run B13-2.5ft for Arsenic

B19-0.5' – Asbestos present – Quantify Asbestos – Run B19-2.5ft for Asbestos (Quantify if present)

B-22-0.5' – Asbestos present – Quantify Asbestos – Run B-22-2.5ft for Asbestos (Quantify if present)

B31-0.5' – Arsenic 52 mg/kg – Run STLC for As on B31-0.5ft, Run B31-2.5ft for Arsenic

B32-0.5' – Lead 190 mg/kg – Run STLC and TCLP on B32-0.5ft, Run B32-2.5ft for lead

B47-0.5' – Lead 55 mg/kg, Arsenic 15 mg/kg – Run STLC for lead on B47-0.5ft, Run B47-2.5ft for lead and arsenic

B48-0.5' – Arsenic 13 mg/kg, low level PAHs – Run B48-2.5ft for Arsenic

B56-0.5' – Arsenic 100 mg/kg, ORO 20 mg/kg Run STLC and TCLP for arsenic on B56-0.5ft, run B56-2.5ft for arsenic

B60-0.5' – Lead 60 mg/kg – Run STLC for lead on B60-0.5ft

B62-0.5' – Lead 62 mg/kg – Run STLC for lead on B62-0.5ft

B63-0.5' – Lead 91 mg/kg – Run STLC for lead on B63-0.5ft, Run B63-2.5ft for lead

Summary of Bulk Asbestos Analysis Results
 EO-485650

AmeriSci Sample #	Client Sample#	HG Area	Sample Weight (gram)	Heat Sensitive Organic %	Acid Soluble Inorganic %	Insoluble Non-Asbestos Inorganic %	Asbestos by PLM/DS	Asbestos by TEM
----------------------	----------------	------------	----------------------------	--------------------------------	--------------------------------	--	-----------------------	--------------------

Analyzed by: Patricia Weakley

Reviewed by: Lateef McIntosh

Date: 6/3/2023

Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represent Qualitative PLM (polarized light microscopy) or Qualitative TEM (transmission electron microscopy) Analysis for confirmation of asbestos presence and identification only, following selections of EPA 600/R-93/116 (method not covered by NVLAP asbestos accreditation); NA = not analyzed; this report relates ONLY to the items tested.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter.

Case Narrative

CES Group, Inc.
33175 Temecula Pkwy
Ste. A-734
Temecula, CA 92592
Skye Greene

Lab Job Number: 485657
Project No: IRVING MS
Location: 3010 Estara Ave., Los Angeles, CA 90065
Date Received: 05/23/23

- This data package contains sample and QC results for eight soil samples, two two-point soil composites, and one three-point soil composite, requested for the above referenced project on 05/23/23. The samples were received cold and intact.
- REPORT REVISED to add missing Lead from the original report.

Semivolatile Organics by GC/MS SIM (EPA 8270C-SIM):

- High RPD was observed for naphthalene in the MS/MSD for batch 314640; the parent sample was not a project sample, and this analyte was not detected at or above the RL in the associated samples.
- B51-0.5FT (lab # 485657-009) was diluted due to the dark and viscous nature of the sample extract.
- B53-0.5FT (lab # 485657-003) and B51D-0.5FT (lab # 485657-021) were diluted due to the dark color of the sample extracts.
- No other analytical problems were encountered.

Pesticides (EPA 8081A):

- B49-0.5FT, B53-0.5FT COMPOSITE (lab # 485657-006), B50-0.5FT, B51-0.5FT, B54-0.5FT COMPOSITE (lab # 485657-014), and B52-0.5FT, B55-0.5FT COMPOSITE (lab # 485657-020) were diluted due to the color of the sample extracts.
- No other analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A):

- Low recoveries were observed for lead and antimony in the MS/MSD for batch 314638; the parent sample was not a project sample, the LCS was within limits, and the associated RPDs were within limits. High recoveries were observed for barium and copper; the LCS was within limits, and the associated RPDs were within limits.
- Low recoveries were observed for antimony in the MS/MSD of B49-0.5FT (lab # 485657-001); the LCS was within limits, the associated RPD was within limits, and these low recoveries were not associated with any reported results.
- No other analytical problems were encountered.

Asbestos by PLM (EPA 600/R-93-116):

AmeriSci in Carson, CA performed the analysis (see sublab report section for certifications). Please see the AmeriSci case narrative.

SAMPLE ACCEPTANCE CHECKLIST

Section 1
 Client: CES Project: Irving MS
 Date Received: 5/23/23 Sampler's Name Present: Yes No

Section 2
 Sample(s) received in a cooler? Yes, How many? 1 No (skip section 2) Sample Temp (°C) (No Cooler) : _____
 Sample Temp (°C), One from each cooler: #1: 3.5 #2: _____ #3: _____ #4: _____
(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)
 Shipping Information: _____

Section 3
 Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam
 Paper None Other _____
 Cooler Temp (°C): #1: 1.4 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	<input checked="" type="checkbox"/>		
Are sample IDs present?	<input checked="" type="checkbox"/>		
Are sampling dates & times present?	<input checked="" type="checkbox"/>		
Is a relinquished signature present?	<input checked="" type="checkbox"/>		
Are the tests required clearly indicated on the COC?	<input checked="" type="checkbox"/>		
Are custody seals present?		<input checked="" type="checkbox"/>	
If custody seals are present, were they intact?			<input checked="" type="checkbox"/>
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			<input checked="" type="checkbox"/>
Did all samples arrive intact? If no, indicate in Section 4 below.	<input checked="" type="checkbox"/>		
Did all bottle labels agree with COC? (ID, dates and times)	<input checked="" type="checkbox"/>		
Were the samples collected in the correct containers for the required tests?	<input checked="" type="checkbox"/>		
Are the containers labeled with the correct preservatives?			<input checked="" type="checkbox"/>
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			<input checked="" type="checkbox"/>
Was a sufficient amount of sample submitted for the requested tests?	<input checked="" type="checkbox"/>		

Section 5 Explanations/Comments

Section 6
 For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____
 Email (email sent to/on): _____ / _____
 Project Manager's response:

Completed By: Date: 5/23/23

Analyzed by: Lateef McIntosh
 Date: 5/30/2023

Reviewed by: Patricia Weakley

Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represent Qualitative PLM (polarized light microscopy) or Qualitative TEM (transmission electron microscopy) Analysis for confirmation of asbestos presence and identification only, following selections of EPA 600/R-93/116 (method not covered by NVLAP asbestos accreditation); NA = not analyzed; this report relates ONLY to the items tested.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter.

Case Narrative

CES Group, Inc.	Lab Job 487441
33175 Temecula	Number:
Pkwy	Project No: IRVING MS
Ste. A-734	Location: 3010 Estara Ave., Los Angeles, CA 90065 - Revised
Temecula, CA 92592	Report
Skye Greene	Date Received: 06/23/23

- This data package contains sample and QC results for six soil samples, requested for the above referenced project on 06/23/23. The samples were received cold and intact.
- Revised Report - Arsenic is now reported by EPA 6020 only.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):

No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015M):

- Low recoveries were observed for diesel C10-C28 in the MS/MSD for batch 317220; the parent sample was not a project sample, the LCS was within limits, the associated RPD was within limits, and these low recoveries were not associated with any reported results.
- B58-0.5FT (lab # 487441-001) and B59-0.5FT (lab # 487441-008) were diluted due to the dark color of the sample extracts.
- No other analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

No analytical problems were encountered.

Metals (EPA 6010B, EPA 6020, and EPA 7471A):

- High recovery was observed for mercury in the MS for batch 316940; the parent sample was not a project sample, the LCS was within limits, and this analyte was not detected at or above the RL in the associated samples. High RPD was also observed for mercury in the MS/MSD for batch 316940; this analyte was not detected at or above the RL in the associated samples.
- Low recoveries were observed for antimony in the MS/MSD for batch 316915; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1
 Client: CES Group Project: Irving MS
 Date Received: 6/23/23 Sampler's Name Present: Yes No

Section 2
 Sample(s) received in a cooler? Yes, How many? 1 No (skip section 2) Sample Temp (°C) (No Cooler) : _____
 Sample Temp (°C), One from each cooler: #1: 5.2 #2: _____ #3: _____ #4: _____
 (Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)
 Shipping Information: _____

Section 3
 Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam
 Paper None Other _____
 Cooler Temp (°C): #1: 0.9 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	X		
Are sample IDs present?	X		
Are sampling dates & times present?	X		
Is a relinquished signature present?	X		
Are the tests required clearly indicated on the COC?	X		
Are custody seals present?		X	
If custody seals are present, were they intact?			X
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			X
Did all samples arrive intact? If no, indicate in Section 4 below.	X		
Did all bottle labels agree with COC? (ID, dates and times)	X		
Were the samples collected in the correct containers for the required tests?	X		
Are the containers labeled with the correct preservatives?	X		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			X
Was a sufficient amount of sample submitted for the requested tests?	X		

Section 5 Explanations/Comments

Section 6
 For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time _____
 Email* (email sent to/on): _____ / _____
 Project Manager's response:

Ranjit,

Run the shallow B-58-0.5ft and B59-0.5ft for Metals, Arsenic, TPH, and VOCs

Run B-58-2.5ft, B58-5ft, B59-2.5ft, and B59-5ft for TPH and VOCs but hold the glass jars so that we can analyze metals or arsenic later if we get high values on the 0.5 ft samples.

Date Received: 07/24/23

This data package contains sample and QC results for two soil samples, requested for the above referenced project on 07/24/23. The samples were received cold and intact.

TPH-Purgeables and/or BTXE by GC (EPA 8015B):

No analytical problems were encountered.

TPH-Extractables by GC (EPA 8015M):

No analytical problems were encountered.

Volatile Organics by GC/MS (EPA 8260B):

No analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):

- Low recoveries were observed for antimony in the MS/MSD for batch 318839; the parent sample was not a project sample, the LCS was within limits, and the associated RPD was within limits.
- No other analytical problems were encountered.

SAMPLE ACCEPTANCE CHECKLIST

Section 1
 Client: CES Group Project: Irving MS
 Date Received: 7/24/23 Sampler's Name Present: Yes No

Section 2
 Sample(s) received in a cooler? Yes, How many? 1 No (skip section 2) Sample Temp (°C) (No Cooler): _____
 Sample Temp (°C), One from each cooler: #1: 5.9 #2: _____ #3: _____ #4: _____
(Acceptance range is < 6°C but not frozen (for Microbiology samples, acceptance range is < 10°C but not frozen). It is acceptable for samples collected the same day as sample receipt to have a higher temperature as long as there is evidence that cooling has begun.)
 Shipping Information: _____

Section 3
 Was the cooler packed with: Ice Ice Packs Bubble Wrap Styrofoam
 Paper None Other _____
 Cooler Temp (°C): #1: 1.6 #2: _____ #3: _____ #4: _____

Section 4	YES	NO	N/A
Was a COC received?	✓		
Are sample IDs present?	✓		
Are sampling dates & times present?	✓		
Is a relinquished signature present?	✓		
Are the tests required clearly indicated on the COC?	✓		
Are custody seals present?		✓	
If custody seals are present, were they intact?			✓
Are all samples sealed in plastic bags? (Recommended for Microbiology samples)			✓
Did all samples arrive intact? If no, indicate in Section 4 below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were the samples collected in the correct containers for the required tests?	✓		
Are the containers labeled with the correct preservatives?	✓		
Is there headspace in the VOA vials greater than 5-6 mm in diameter?			✓
Was a sufficient amount of sample submitted for the requested tests?	✓		

Section 5 Explanations/Comments

Section 6
 For discrepancies, how was the Project Manager notified? Verbal PM Initials: _____ Date/Time: _____
 Email (email sent to/on): _____ / _____
 Project Manager's response: _____

Completed By: *Oliver Szyganski* Date: **JUL 24 2023**

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT

TO: Agencies, Organizations, Property Owners, and Interested Parties

PROJECT TITLE: Irving Middle School Major Modernization Project

SUBJECT: Notice of Preparation of an Environmental Impact Report

NOTICE IS HEREBY GIVEN that the Los Angeles Unified School District (LAUSD or District), as Lead Agency for the Project, has prepared an Initial Study for the Irving Middle School Major Modernization Project, pursuant to the California Environmental Quality Act (CEQA) (Public Resources Code [PRC], Division 13, Section 21000 et seq. [CEQA Statute] and the California Code of Regulations [CCR], Title 14, Division 6, Chapter 3, Section 15000 et seq. [CEQA Guidelines]). An Initial Study is a detailed informational document that analyzes a proposed project's potentially significant environmental impacts. The purpose of this notice is to solicit comments regarding the content of the Draft Environmental Impact Report (EIR).

PROJECT LOCATION: The 11.2-acre Irving Middle School (Irving MS) Campus is located at 3010 Estara Avenue, Los Angeles, Los Angeles County, California.

PROJECT DESCRIPTION: The proposed Project involves building replacement and reconfiguration on the Irving MS Campus as part of LAUSD's update to the School Upgrade Program (SUP). The scope consists of the modernization of the Campus to facilitate a safe and secure campus that is better aligned with the current instructional program and meets current Division of the State Architect (DSA) requirements and educational specifications. The proposed Project includes the demolition of the three permanent classroom buildings located directly over an identified earthquake fault (Homemaking Building, Classroom Building, and Administration Building) and the removal of six portable bungalow buildings in the northwest corner of the site. These buildings would be replaced by the construction of one, approximately 55,000-square-foot, two-story building that would house 19 classrooms and support spaces, administration offices, library, and other building service spaces. Additionally, the proposed Project would include a new Maintenance and Operation (M&O) building and two modular classrooms to be used by the City of Angeles Community School. The proposed Project also includes essential upgrades including seismic retrofit of the existing Auditorium Building outside of the earthquake fault, the removal of barriers as well as other accessibility upgrades, and various landscape and hardscape improvements. While the Project would reduce the total number of standard classrooms on the campus from 65 to 46 to accommodate the long-term needs of the school and community, it would provide additional outdoor learning and gathering spaces for its students.

POTENTIAL ENVIRONMENTAL EFFECTS: Pursuant to CEQA Guidelines Section 15064(f)(1), and, based on the environmental analysis in the Initial Study, the District has determined that an EIR is the appropriate level of environmental documentation for the Project. The analysis in the Initial Study has determined that the Project would not have the potential to cause significant impacts related to aesthetics, agriculture/forestry resources, biological resources, energy, geology/soils, greenhouse gas emissions, hydrology/water quality, land use/planning, mineral resources, population/housing, public services, recreation, tribal cultural resources, utilities/service systems, and wildfire. The focus of the EIR will be on the potential significant effects of the Project related to air quality, cultural resources, hazards & hazardous materials, noise, pedestrian safety, and transportation & traffic.

PUBLIC SCOPING PERIOD: LAUSD will make this NOP and the Initial Study (pursuant to California Code of Regulations, Title 14, Section 15082) available for public review and comment from **December 1, 2023, to January 5, 2024**.

RESPONSES AND COMMENTS: Please indicate a contact person for your agency or organization and send your comments to:

Los Angeles Unified School District
Office of Environmental Health and Safety
Attention: Mr. Julian Capata, CEQA Project Manager
333 South Beaudry Avenue, 21st Floor
Los Angeles, CA 90017
Email: CEQA-comments@lausd.net

Please include "Irving MS Major Mod" in the subject line

PUBLIC MEETING: LAUSD will hold a public scoping meeting on **Wednesday, December 6, 2023 at 6:00 PM in the Irving Middle School Auditorium**, 3010 Estara Avenue, Los Angeles, California 90065. All agencies, organizations, and interested parties are encouraged to attend.

DOCUMENT AVAILABILITY: The Initial Study is available for review at the following locations:

- LAUSD, Office of Environmental Health and Safety website: <https://www.lausd.org/CEQA>
- Irving Middle School Main Office, 3010 Estara Avenue, Los Angeles, California 90065

AVISO DE PREPARACIÓN DE UN INFORME DE IMPACTO AMBIENTAL

PARA: Agencias, Organizaciones, Propietarios y Partes Interesadas
TÍTULO DEL PROYECTO: Proyecto de Modernización de la Intermedia Irving
ASUNTO: Aviso de Elaboración de Informe de Impacto Ambiental

POR LA PRESENTE SE NOTIFICA El Distrito Escolar Unificado de Los Ángeles (LAUSD, por sus siglas en inglés, o el Distrito), como la agencia líder, ha preparado un Estudio Inicial para el Proyecto Escolar de Modernización de la Intermedia Irving (Irving MS), en conforme con la Ley de Calidad Ambiental de California (California Environmental Quality Act o CEQA) (Código de Recursos Públicos [PRC], División 13, Sección 21000 et seq. [Estatuto CEQA] y el Código de Regulaciones de California [CCR], Título 14, División 6, Capítulo 3, Sección 15000 y siguientes [Directrices de la CEQA]). Un Estudio Inicial es un documento informativo detallado que analiza los impactos ambientales potencialmente significativos de un proyecto propuesto. El propósito de este aviso es solicitar comentarios sobre el contenido del Borrador del Informe de Impacto Ambiental (EIR).

UBICACIÓN DEL PROYECTO: El campus de 11.2 acres de la Escuela Intermedia Irving (Irving MS) está ubicado en 3010 Estara Avenue, Los Ángeles, Condado de Los Ángeles, California.

DESCRIPCIÓN DEL PROYECTO: El proyecto propuesto incluye el reemplazo y reconfiguración del edificio en el campo escolar de Irving MS para actualizar el proyecto como parte del Programa de Actualización Escolar (School Upgrade Program o SUP) de LAUSD. El alcance del trabajo consiste de la modernización del campo escolar para facilitar un campo seguro que e alineado con el programa de instrucción actual y cumpla con los requisitos actuales de la División del Arquitecto del Estado (Division of State Architect o DSA) y las especificaciones educativas. El proyecto propuesto incluye la demolición de los tres edificios de aulas permanentes ubicados directamente sobre una falla sísmica identificada (Edificio de Tareas de Hogar, Edificio de Aulas y Edificio de Administración) y la eliminación de seis edificios de bungalows portátiles en la esquina noroeste del sitio. Estos edificios serían reemplazados por la construcción de un edificio de aproximadamente 55,000 pies cuadrados de dos pisos que albergaría 19 aulas y espacios apoyativos, oficinas administrativas, biblioteca y otros espacios de servicio. Adicionalmente, el proyecto propuesto incluiría un nuevo edificio de Mantenimiento y Operaciones (M&O) y dos aulas modulares que serán utilizadas por la Escuela Comunitaria de la Ciudad de Ángeles. El proyecto propuesto también incluye mejoras esenciales, incluida la modernización sísmica del edificio del auditorio existente sobre la falla sísmica, la eliminación de barreras, así como otras mejoras de accesibilidad, y varias mejoras paisajísticas. Mientras el proyecto reduciría la cantidad total de aulas en el campo escolar de 65 a 46 aulas para satisfacer las necesidades, a largo plazo, de la escuela y la comunidad, proporcionaría espacios adicionales de aprendizaje y reunión al aire libre para sus estudiantes.

POSIBLES EFECTOS AMBIENTALES: En conforme con la Sección 15064(f)(1) de las Directrices de CEQA, y, basado en el análisis ambiental del Estudio Inicial, el Distrito ha determinado que un EIR es el nivel apropiado de documentación ambiental para el Proyecto. El análisis del Estudio Inicial ha determinado que el Proyecto no tendría posibilidad de causar impactos significativos relacionados con la estética, los recursos agrícolas/forestales, los recursos biológicos, la energía, la geología/suelos, las emisiones de gases de efecto invernadero, la hidrología/calidad del agua, el uso de la tierra/planificación, los recursos minerales, la población/vivienda, los servicios públicos, la recreación, los recursos culturales tribales, los servicios públicos/sistemas de servicios públicos y los incendios forestales. El EIR se centrará en los posibles efectos significativos del proyecto relacionados con la calidad del aire, los recursos culturales, los peligros y materiales peligrosos, el ruido, la seguridad de los peatones y el transporte y el tráfico.

PERÍODO DE ALCANCE PÚBLICO: El LAUSD pondrá a disposición del público este Aviso de Preparación (NOP) y el Estudio Inicial (en conforme con el Código de Regulaciones de California, Título 14, Sección 15082) para su revisión y comentarios públicos desde **el 1 de diciembre de 2023 hasta el 5 de enero de 2024**.

RESPUESTAS Y COMENTARIOS: Por favor, indique una persona de contacto para su agencia u organización y envíe sus comentarios a:

Los Angeles Unified School District
Office of Environmental Health and Safety
Atención: Mr. Julian Capata, CEQA Project Manager
333 South Beaudry Avenue, 21st Floor
Los Angeles, CA 90017
Email: CEQA-comments@lausd.net

Por favor, incluya "Irving MS Major Mod" en la línea de asunto

REUNIÓN PÚBLICA: El LAUSD llevará a cabo una reunión pública de alcance **el miércoles 6 de diciembre de 2023 a las 6:00 p. m.** en el **Auditorio de la Escuela Intermedia Irving**, 3010 Estara Avenue, Los Ángeles, California 90065. Se anima a todas las agencias, organizaciones y partes interesadas a asistir.

DISPONIBILIDAD DE DOCUMENTOS: El Estudio Inicial está disponible para su revisión en los siguientes lugares:

- Sitio de internet de LAUSD Office of Environmental Health and Safety: <https://www.lausd.org/CEQA>
- Oficina Principal de la Escuela Intermedia Irving, 3010 Estara Avenue, Los Ángeles, California 90065

Modernization Project (NOP)
SCH # 2023120006
Vic. LA-2/16.257, LA-5/22.296
GTS # 07-LA-2023-04390

Dear Julian Capata:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the above-referenced project. The proposed Project will include building replacement and reconfiguration on the school campus as part of the Los Angeles School District's School Upgrade Program (SUP). This project includes the demolition of three permanent classroom buildings, which are located on an earthquake fault, and the removal of six portable bungalow buildings. A new 55,000- square-foot two-story building will be replacing the removed buildings. There will also be the construction of a new maintenance and Operation building, and two new modular classrooms to be used by the City of Angeles Community School. The Project also includes seismic retrofit the existing Auditorium Building, the removal of existing barriers, and accessibility upgrade, various landscape, and hardscape improvements. The Project will also provide additional outdoor learning and gathering spaces for the students. The Los Angeles Unified School District: Office of Environmental Health & Safety is the Lead Agency under the California Environmental Quality Act (CEQA).

The closest state facilities are SR-2 (Glendale Freeway) and SR-5. After reviewing the project's Initial Study, Caltrans has the following comments:

- Caltrans encourages the Lead Agency to consider any reduction in vehicle speeds to benefit pedestrian and bicyclist safety, as there is a direct link between impact speeds and the likelihood of fatality or serious injury. The most effective methods to reduce pedestrian and bicyclist exposure to vehicles is through physical design and geometrics. These methods include the construction of physically separated facilities such as Class IV bikeways, wide sidewalks, curb extensions, pedestrian refuge islands, landscaping, street furniture, and reductions in crossing distances through roadway narrowing. Visual indicators such as, pedestrian and bicyclist

warning signage, flashing beacons, crosswalks, signage, and striping should be used in addition to physical design improvements to indicate to motorists that they can expect to see and yield to people walking or riding bikes.

- Caltrans recommends the following multimodal improvements for this project:
 - Improve bicycle infrastructure along Fletcher Dr., such as protected Class IV bikeways, to improve safety and comfort for all road users.
 - Be sure to include canopy trees, bioswales, bicycle parking facilities, and street furniture to provide a comfortable and sustainable environment to encourage active transportation modes and improve community health.
 - In addition to bioswales, incorporate permeable paving surfaces wherever possible to manage stormwater, replenish groundwater, and prevent pollution runoff.
 - Provide high quality bus infrastructure for the stations along Fletcher Dr.
 - Use high-visibility continental crosswalks, curb extensions, count-down signal heads, pedestrian refuge islands, and pedestrian scrambles at the intersections along Fletcher Dr.
 - Leading pedestrian intervals can give pedestrians a 7-second head start in crosswalks; this provides additional crossing time and reduces the amount of time that pedestrians are exposed to high-speed vehicle traffic.
- Caltrans recommends the following during the construction stage:
 - Work with Caltrans Office of Permits, Multi-Modal Unit, for a designated truck route for construction trucks to transport construction equipment to and from the construction sites.
 - Construction vehicles/equipment should use alternative routes to avoid congested state facilities, especially during peak hours.
 - Cover construction trucks with tarpaulin to avoid debris spillage onto State facilities.

As a reminder, any transportation of heavy construction equipment and/or materials that requires the use of oversized transport vehicles on State Highways will need a Caltrans transportation permit. Caltrans recommends that the Project limit construction traffic to off-peak periods to minimize the potential impact on State facilities. If construction traffic is expected to cause issues on any State facilities, please submit a construction traffic control plan detailing these issues for Caltrans' review.

RE: NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR) FOR THE IRVING MIDDLE SCHOOL MAJOR MODERNIZATION PROJECT, DATED DECEMBER 01, 2023 STATE CLEARINGHOUSE # [2023120006](#)

Dear Julian Capata,

The Department of Toxic Substances Control (DTSC) received a Notice of Preparation (NOP) of a Draft Environmental Impact Report (DEIR) for the Irving Middle School Major Modernization Project (Project). The proposed Project involves building replacement and reconfiguration on the Irving Middle School Campus (Campus) as part of Los Angeles Unified School District's (LAUSD's) update to the School Upgrade Program (SUP). The scope consists of the modernization of the Campus to facilitate a safe and secure campus that is better aligned with the current instructional program and meets current Division of the State Architect (DSA) requirements and educational specifications. The proposed Project includes the demolition of the three permanent classroom buildings located directly over an identified earthquake fault (Homemaking

Building, Classroom Building, and Administration Building) and the removal of six portable bungalow buildings in the northwest corner of the site. These buildings would be replaced by the construction of one, approximately 55,000-square-foot, two-story building that would house 19 classrooms and support spaces, administration offices, library, and other building service spaces. Additionally, the proposed Project would include a new Maintenance and Operation (M&O) building and two modular classrooms to be used by the City of Angeles Community School. The proposed Project also includes essential upgrades including seismic retrofit of the existing Auditorium Building outside of the earthquake fault, the removal of barriers as well as other accessibility upgrades, and various landscape and hardscape improvements. While the Project would reduce the total number of standard classrooms on the campus from 65 to 46 to accommodate the long-term needs of the school and community, it would provide additional outdoor learning and gathering spaces for its students. Based on our review, DTSC requests consideration of the following comments.

1. If the district plans to use California Department of Education (CDE) State funds for the project, then the district shall comply with the requirements of Education Code (EDC), [§17210](#), [§17213.1](#), and [§17213.2](#), unless otherwise specifically exempted under section [§17268](#). If the district is not using CDE State funds for the project, or is otherwise specifically exempt under section [§17268](#), DTSC recommends the district continue to investigate and clean up the Site, if necessary, under the oversight of Los Angeles County and in concurrence with all applicable DTSC guidance documents. For more information on the CDE State funding, please visit [Office of Public-School Consultation](#) webpage.

A local education agency may also voluntarily request the CDE site/plan approval for locally funded site acquisitions and new construction projects. In these cases, CDE will require DTSC to review and approve prior to its final approval, except when exempt under section 17268.

2. If the District elects to proceed and conduct additional environmental assessments at the Site under DTSC oversight, it should enter into an Environmental Oversight Agreement with DTSC to oversee the preparation and or review of the existing environmental assessment documents.
3. If buildings or other structures are to be demolished on any project sites included in the proposed project, surveys should be conducted for the presence of lead-based paints or products, mercury, asbestos containing materials, and polychlorinated biphenyl caulk. Removal, demolition, and disposal of any of the above-mentioned chemicals should be conducted in compliance with California environmental regulations and policies. In addition, sampling near current and/or former buildings should be conducted in accordance with DTSC's 2006 [*Interim Guidance Evaluation of School Sites with Potential Contamination from Lead Based Paint, Termiticides, and Electrical Transformers*](#)
4. DTSC recommends that all imported soil and fill material should be tested to ensure any contaminants of concern are within approved screening levels for the intended land use. To minimize the possibility of introducing contaminated soil and fill material there should be documentation of the origins of the soil or fill material and, if applicable, sampling be conducted to ensure that the imported soil and fill material meets screening levels for the intended land use. The soil sampling should include analysis based on the source of the fill and knowledge of the prior land use.

DTSC appreciates the opportunity to comment on the Irving Middle School Major Modernization Project's NOP. If you would like to proceed with DTSC's school environmental review process, please visit [DTSC's Evaluating & Clean-up School 3-Step Process](#) to begin a Phase I Environmental Site Assessment.

Re: 2023120006, Irving Middle School Major Modernization Project, Los Angeles County

Dear Mr. Capata:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, § 15064.5 (b) (CEQA Guidelines § 15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

[AB 52](#)

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

- 1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project:** Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

 - a. A brief description of the project.
 - b. The lead agency contact information.
 - c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
 - d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

- 2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report:** A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subs. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

 - a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

- 3. Mandatory Topics of Consultation If Requested by a Tribe:** The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

 - a. Alternatives to the project.
 - b. Recommended mitigation measures.
 - c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

- 4. Discretionary Topics of Consultation:** The following topics are discretionary topics of consultation:

 - a. Type of environmental review necessary.
 - b. Significance of the tribal cultural resources.
 - c. Significance of the project's impacts on tribal cultural resources.
 - d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

- 5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process:** With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

- 6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document:** If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

 - a. Whether the proposed project has a significant impact on an identified tribal cultural resource.
 - b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

- 7. Conclusion of Consultation:** Consultation with a tribe shall be considered concluded when either of the following occurs:
- a.** The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
 - b.** A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).
- 8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document:** Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).
- 9. Required Consideration of Feasible Mitigation:** If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).
- 10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:**
- a.** Avoidance and preservation of the resources in place, including, but not limited to:
 - i.** Planning and construction to avoid the resources and protect the cultural and natural context.
 - ii.** Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
 - b.** Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
 - i.** Protecting the cultural character and integrity of the resource.
 - ii.** Protecting the traditional use of the resource.
 - iii.** Protecting the confidentiality of the resource.
 - c.** Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
 - d.** Protecting the resource. (Pub. Resource Code §21084.3 (b)).
 - e.** Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
 - f.** Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).
- 11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource:** An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:
- a.** The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
 - b.** The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
 - c.** The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. **Tribal Consultation**: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. **No Statutory Time Limit on SB 18 Tribal Consultation**. There is no statutory time limit on SB 18 tribal consultation.
3. **Confidentiality**: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. **Conclusion of SB 18 Tribal Consultation**: Consultation should be concluded at the point in which:
 - a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
 - b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: <http://nahc.ca.gov/resources/forms/>.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:
 - a. If part or all of the APE has been previously surveyed for cultural resources.
 - b. If any known cultural resources have already been recorded on or adjacent to the APE.
 - c. If the probability is low, moderate, or high that cultural resources are located in the APE.
 - d. If a survey is required to determine whether previously unrecorded cultural resources are present.
2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
 - a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
 - b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:
 - a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.
 - b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.
 - a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, § 15064.5(f) (CEQA Guidelines § 15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.
 - b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.
 - c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code § 7050.5, Public Resources Code § 5097.98, and Cal. Code Regs., tit. 14, § 15064.5, subdivisions (d) and (e) (CEQA Guidelines § 15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address:
Andrew.Green@nahc.ca.gov.

RE: Irving MS Major Mod - Notice of Preparation and Initial Study

Dear Mr. Julian Capata,

As a parent of an Irving MS student and neighborhood resident, I appreciate the opportunity to comment on the [Notice of Preparation](#) of an Environmental Impact Report for the proposed Irving Middle School Major Modernization Project (Project). The proposed Project includes the demolition of classroom buildings located over a postulated fault zone identified by LAUSD's geotechnical consultant.¹ The Project proposes to demolish the main classroom building (the "Administration Building"), which is historically significant, and replace it and other demolished buildings with a new building that would result in a reduction of the total number of classrooms on campus from 65 to 46.

I request that the EIR evaluate a rehabilitation alternative that will preserve the historically significant Administration Building. LAUSD families have choices when considering where to send their children to magnet schools. The historic campus and its older trees were a major factor in our decision to send our second child to Irving MS instead of the school their older sibling attended. The proposed new construction remains within the Alquist-Priolo Fault Zone – earthquake risks will remain under the proposed Project, and the neighborhood will lose historic character that should be cherished instead of demolished.

I also request that the EIR Project Description include a detailed timeline for the Project. It is concerning that the proposed Project, including planning for demolition of the historically

¹ The [Initial Study](#) page 14 footnote 28 incorrectly suggests that the California Department of Conservation, California Geological Survey find the "Hollywood Fault and the Raymond Fault running beneath the Campus." The [CGS mapping](#) shows two postulated faults mostly sandwiching the campus, and not underlying any historically significant campus buildings. A postulated fault zone has been identified by LAUSD's geotechnical consultant as presented in [Initial Study Appendix D](#).

significant Administration Building, appears to predate the completion of geologic borings in January 2023 that support the findings of a fault postulated to underly the western end of the Administration Building ([Initial Study Appendix D](#)). It is difficult to tell from the information as presented the true reason for the planned demolition of a historically significant school building.

Thank you very much for the opportunity to review and comment on this important Project.

Sincerely,

Sarah J Bartlett, BS, MCP
California Professional Geologist No. 8336
4514 Wawona St, 90065

Irving Middle School is home school to a few different neighborhoods. What type of outreach has been done to inform and prepare families of incoming 6th & 7th Graders? How is the charter school on campus assisting parents or informing re: deadlines and transition within

Renewable Resources?

the District?

Irving Middle School
Project Update / CEQA Community Meeting
December 6, 2023

Attendees: 10 in person (Via Zoom 32)

Questions and Comments:

1. Janet Chu (Guest) 06:07 PM - Based on the findings, I understand the need for this, and the long lead time to get started. But what can be done in the interim for safety- especially re: earthquakes?
2. Samantha Fuentes (Guest) 06:19 PM - What does "New City of Angels" mean?
3. Christine Louise Mills (Guest) 06:20 PM - On zoom, we can't tell to what Mr. Osura is referring - is there a way host to also interact with the screenshare?
4. Emily Bills she/her (Guest) 06:21 PM - I would like to hear about mitigation of toxic lead and other dust created by the demolition. *Where can we find the specific protocol for demolition and containment of dust/debris created by demolition, especially since lead dust can remain 'in the environment indefinitely?*
5. Emily Bills she/her (Guest) 06:28 PM - Do you conduct air quality tests on the temporary classroom buildings, for VOCs etc.? If so, where will we be able to find documentation on that air quality?
6. Lenni L (Guest) 06:31 PM - Many of my friends are coming to Irving for programs like Robotics, RC, and Dance. We host competitions to help our kids move forward in State/National competitions and fundraising - all using the current gym. Will construction impact our ability to host these types of tournaments, dance recitals?
7. Laura and Ray Montenegro (Max) (Guest) 06:49 PM - In what ways will students provide input into the design process? Similarly, how will teachers' ideas be incorporated?
8. elizabeth (Guest) 06:50 PM - What will happen when the demolition starts with the neighbor's? The dust, what times will the demolition begin? The infestation of rats that will come out? Will the sidewalks also be fixed? There needs to be more lighting for the kids when they get out at 6. There are rats already visible with all the junk next to the S buildings
9. Heather Melish (Guest) 06:52 PM - Hi, thank you for your presentation today. My question is about planning for the quality of the new construction and the design. When the budget was developed, was there any premium attached so that the new admin/classroom building meets the quality of the existing building in its construction and it's ornamentation?
10. Christine Louise Mills (Guest) 06:52 PM - For the next meeting, can we make sure there is a camera for speakers so those joining remotely can see speakers and what they are referencing/pointing to?
11. Janet Chu (Guest) 06:53 PM - can we assume that the bulk of the construction will happen on weekends and over the summer? pretty please? ;-)
12. elizabeth (Guest) 07:01 PM - Health wise it's hazardous with all the lead, dust, asbestos. You don't live next door. Come and look at the night and see for yourself how any rats there are coming out at this time.

13. Samantha Fuentes (Guest) 07:02 PM - Is the construction taking place during school hours or after school ?

14. elizabeth (Guest) 07:08 PM - City of LA isn't doing anything about the sidewalks! I have asked several times. Why wasn't the Infestation addressed?

15. Heather Melish (Guest) 07:10 PM - As a follow up- is there any art component?

16. elizabeth (Guest) 07:13 PM - Nothing has ever been done the principal has known for years , it's going to get worse with the demolition

RE: DRAFT SOIL REMOVAL PLAN
Washington Irving Middle School
3010 Estara Ave, Los Angeles, CA 90065

1.0 INTRODUCTION

CES Group was retained by the Los Angeles Unified School District (LAUSD), Office of Environmental Health and Safety (OEHS) to prepare a Soil Removal Plan (SRP) to support excavation, handling, transportation and disposal of arsenic- and asbestos-impacted soil during the planned construction activities at Washington Irving Middle School, Los Angeles, California.

This SRP has been prepared to address the potential health risks to construction workers, onsite students and staff, and surrounding residents through the implementation of soil management processes intended to close potential exposure routes to potentially impacted soils. The SRP will be utilized to minimize potential exposures and offsite migration of potentially impacted soils during excavation, soil stockpiling, and transportation of soil offsite for disposal.

This SRP provides the following information:

- Background of the Site, the reason for the soil management program, and brief overviews of proposed construction activities
- Responsibilities and contact information of the stakeholders
- Pre-construction, excavation, fabrication activities, and planning including conferencing,
- training and briefing requirements, and site-specific health and safety requirements
- Worksite inspections, environmental monitoring, and management of site conditions
- Dust control and mitigation for on- and offsite control of fugitive dust

- Soil handling during and after installation activities, including soil management requirements, onsite soil handling, and soil backfill requirements
- Requirements for excavated soil disposal

2.0 BACKGROUND INFORMATION

2.1 Previous Site Investigations

A Preliminary Environmental Assessment was conducted for the Site in May 2023 through October 2023. The results of the PEA investigation (CES, 2023) are indicated below.

2.2 PEA Sampling Results

On May 20 and 21, 2023, a total of 63 initial soil borings were advanced across the site to investigate possible contaminants across the property in preparation for site renovation activities. On June 23, 2023, additional samples were taken from an area adjacent to an underground storage tank (UST) of interest. On July 21 samples were taken of the material suspected to be from the UST's secondary containment. Soil boring locations are shown on Figure 1.

Initial results for samples taken at 0.5 ft indicated elevated lead concentration at 10 locations, elevated arsenic concentrations at eight (8) locations, and asbestos presence at two (2) locations. Upon analysis of deeper samples, lead and arsenic levels were within the acceptable limits for LAUSD. Soluble Threshold Limit Concentration (STLC) and Toxicity Characteristic Leaching Potential (TCLP) results also indicated non-hazardous levels of lead and arsenic. Low levels of Organochlorine Pesticides (OCPs), Polychlorinated Biphenyls (PCBs), Poly Aromatic Hydrocarbons (PAHs), and total petroleum hydrocarbons were detected in several samples but were within the acceptable range.

On October 20, 2023, step out samples were collected in the vicinity of B10, B12, B19, B22, B31, B47, and B56 to further define the arsenic and arsenic area of impact. The step out arsenic results ranged from 3.3 mg/kg to 270 mg/kg. The results were generally low level with the exception of B56.1, which showed California-hazardous levels of arsenic. Step out samples collected from B19 and B22 were analyzed for asbestos. No asbestos was detected in any of the step out samples.

To further evaluate the maximum detected lead and arsenic concentrations, the EPA ProUCL software was used to quantify the 95% Upper Confidence Limit (95% UCL) and then the 95% UCL for lead and arsenic were compared to the applicable screening limit. The 95% UCL for lead is 53.61 mg/kg and the 95% UCL for arsenic is 17.23 mg/kg. The human health risk is typical of similar school Site operations in the State of California for these constituents. The UCL for lead is below LAUSD's screening level of 80 mg/kg. The UCL for arsenic is above LAUSD's screening level of 12 mg/kg. None of the soil was determined to be above hazardous levels with the exception of step out sample B56.1.

Elevated levels of hydrocarbons and VOCs were detected in samples taken from the tank area, with highest concentration being 3400 mg/kg of diesel-range hydrocarbons

at 13 feet 8 inches bgs.

3.0 ANTICIPATED WORK AT THE SITE

3.1 Anticipated Construction Activities

The proposed construction/demolition activities will require excavation of soil in various areas across the campus. The excavation would disturb impacted soils at the Site. Disturbance of potentially impacted soils requires controls for fugitive dust. The excavation of this soil, if not conducted in a controlled manner, may also present an exposure concern for construction workers. Additionally, the excavated soils will need to be properly characterized for offsite disposal.

3.2 Existing Potential Hazards

Site investigations have identified the following contaminants of concern (COCs):

- Arsenic in the upper 0.5 feet of soil in five (5) locations (B10, B12, B31, B47, B56) with California-hazardous levels of arsenic at step out boring B56.1.
- Asbestos in the upper 0.5 ft in two (2) locations (B19, B22)

3.3 Excavation and Offsite Disposal of Impacted Soil

The remedy involves the excavation and offsite disposal of arsenic- and asbestos-impacted soil (above the respective screening levels) within the proposed project area. There are seven (7) areas of concern (AOC) with an estimated total of 4227 cubic feet (156.6 cubic yards, 219.2 tons) of impacted soil. The total impacted soil volume will be excavated from within the project areas as follows.

Estimated Excavation Volumes			
Area of Concern (AOC)	Contaminant of Concern (COC)	Non-Hazardous Volume	Cal-Haz Volume
AOC 1 - B10	Arsenic	576 ft ³ (21.3 yd ³ , 30 tons)	
AOC 2 - B12	Arsenic	321 ft ³ (12 yd ³ , 16.6 tons)	
AOC 3 - B31	Arsenic	189 ft ³ (7 yd ³ , 9.8 tons)	
AOC 4 - B47	Arsenic	500 ft ³ (18.5 yd ³ , 26 tons)	
AOC 5 - B56	Arsenic	664.5 ft ³ (24.6 yd ³ , 34.5 tons)	1689 ft ³ (62.6 yd ³ , 87.6 tons)
AOC 6 - B19	Asbestos	186 ft ³ (6.9 yd ³ , 9.6 tons)	
AOC 7 - B22	Asbestos	102 ft ³ (3.8 yd ³ , 5.3 tons)	
Total:		2538 ft ³ (94 yd ³ , 131.6 tons)	1689 ft ³ (62.6 yd ³ , 87.6 tons)

The maximum excavation depth is 1.5 feet bgs. The excavation locations are

illustrated on Figures 2 and 3.

Soil excavation would involve the use of conventional excavation equipment, such as backhoes and loaders to remove the impacted soil from the project areas. Excavated soil will be directly loaded into staged trucks or bins, or temporarily stockpiled on plastic sheeting next to the excavation areas until it can be loaded out for offsite disposal. Excavation is assumed to be estimated at a maximum of 1.5 feet bgs; therefore, sloping and shoring should not be required.

Affected soil removed from the excavations will be transported offsite to an appropriate, licensed LAUSD-approved facility for disposal. After completion of the soil removal actions at each location, confirmation soil sampling will be conducted along the excavation sidewalls and bottoms to verify that the cleanup goals were met. Following LAUSD requirements, imported backfill soil will be tested and certified, or soil from onsite borrow areas not affected by the COPCs, will be used to backfill the excavations in preparation for site construction activities.

3.4 UST Removal Procedures

The scope of work for this project includes the removal of a UST. The following activities are anticipated.

Pre-Removal Activities:

- Preparation of a site-specific health and safety plan
- Obtain necessary permits
- Provide safety measures including fencing and barriers around the excavation area. Signs shall be posted indicating “No Smoking” or “Open Flame.”
- Notify permit inspectors at least 48 hours in advance of field operations if required

Removal Activities:

- All items known to be associated with the USTs shall be isolated and disconnected.
- Saw cut the perimeter of the UST excavation if necessary.
- Excavate overburden soil to expose the UST and associated equipment in preparation for removal. Soil will be stockpiled on site for removal.
- Remove and containerize any fluids or oils remaining in the UST and/or conveyance piping and pressure wash the inside of the UST.
- Transport the UST contents and wash water to an approved off-site disposal/recycling facility. Segregate residual oils for transportation by a licensed hazardous waste disposal transporter. Waste manifests will be maintained.
- Excavate the UST using an excavator or other approved lifting equipment.
- Break up any concrete pad found beneath the UST into pieces capable of being transported and dispose of as construction debris at an off-site disposal facility.

- Remove a minimum of one foot of soil from the sides and bottom of the excavation.
- Monitor excavated soil for segregation into “clean” and “impacted” stockpiles based on PID readings, soil staining, and/or odors.
- Collect soil samples from the sides and bottom of the excavation area as indicated below.
- The UST will be transported to an off-site facility for recycling or disposal.
- The excavation will be backfilled pending permission from LAUSD using LAUSD approved backfill material and compacted to grade per the site’s grading plan.

Soil Sampling in UST Area:

Soil samples will be collected in glass jars. All samples will be sent to a State of California-certified environmental laboratory. Samples for VOCs will be collected using a TerraCore Sampler. All samples will be labeled, placed in a cooler with ice, and transported to a California-certified laboratory under chain-of-custody protocol. Soil samples will be analyzed for the following compounds:

- Total petroleum hydrocarbons as gasoline (TPHg) (C4-C12) using EPA Method 8015M
- Total petroleum hydrocarbons as diesel and oil (TPHd and TPHo) (C13-C40) using EPA Method 8015M
- Volatile Organic Compounds (VOCs) including BTEX, MTBE, and other oxygenates using EPA Method 8260B and 5035 protocol
- Title 22 Metals using EPA Method 6010B and 7470A

3.5 SCAQMD Rule 1166 Monitoring

If contaminated soil releasing VOCs above 50 ppmv is identified, the South Coast Air Quality Management District (SCAQMD) will be notified regarding the renovation work at the subject property. A site-specific permit will be obtained for the project due its location at a school property. Excavation activities will be performed in compliance with all applicable SCAQMD regulations.

4.0 SOIL MANAGEMENT PLAN

The procedures and requirements for soil management prior to the start of, during, and following excavation and construction activities associated with the project will be described in this section. The Environmental Consultant will document and record compliance with these requirements in their daily reports that will be maintained onsite throughout the project.

4.1 PRE-CONSTRUCTION/EXCAVATION ACTIVITIES

The following section presents the activities that will be performed prior to and during the excavation and earthmoving activities.

4.2 PRE-WORK MEETING

Prior to beginning work, a pre-work conference (meeting) shall be held for the purpose of reviewing the project. The Contractor will attend this pre-work meeting and will require all subcontractors, as necessary, to attend in order to ensure all topics are adequately covered. Soil management topics to be discussed include, but are not limited to:

- HASP
- SRP
- Soil storage, stockpiling, and segregation procedures
- Site monitoring
- Chain of Command
- Stormwater controls and Best Management Practices (BMPs)
- Worker responsibilities
- Other topics as appropriate

4.3 PRE-EXCAVATION WORKSITE INSPECTION

Before excavation or other soil-disturbing activities begin, a preparatory inspection must be conducted by the Contractor to ensure the proper soil management provisions are available and ready. This will include the DigAlert notification(s) and stormwater controls, permits, and BMPs.

4.4 SITE CONTROL MEASURES

Due to the presence of COCs at the Site, SCAQMD Rule 403 and Rule 1466 is applicable to the Site. The following site control measures, already discussed, are in compliance with applicable rules. Permit applications must be in accordance with the requirements of applicable SCAQMD rules.

4.5 SOIL EXCAVATION, STOCKPILING, AND TRANSPORTATION

EXCAVATION

Solid waste generated will either be recycled at an offsite recycling facility, stockpiled prior to transportation to offsite disposal facilities, or containerized in waste bins, or drums prior to transportation to offsite disposal facilities. Hazardous waste generated during the removal action will be disposed of in accordance with all applicable local, state, and federal laws and regulations.

Soil stockpiles will be placed on polyethylene sheeting to prevent contamination of underlying pavement or soil. Each stockpile will also be covered with plastic sheeting or a soil stabilizer to prevent windblown dust. BMPs, including the use of fiber rolls around the base of stockpiles to prevent sediment migration, and sandbags to ensure that piles remain covered, will be implemented as necessary. At a minimum, the Contractor will conform to the BMPs set forth by the California Storm Water Quality

Association (CASQA) BMP handbooks for the elimination and reduction of air pollution and storm water pollution from stockpiles or staged soil.

Contractor shall coordinate with LAUSD representatives to ensure that all wastes generated are appropriately stored, characterized, hauled offsite, and disposed of in accordance with local, state, and federal regulations. Following waste characterization, soil and debris will be loaded into trucks and hauled to the appropriate disposal facility based on waste classification. Waste hauling trucks will be covered and decontaminated prior to leaving the worksite to ensure that no waste is blown out of trucks or tracked offsite on truck tires.

Solid waste minimization strategies shall be implemented whenever possible. Excess construction materials will be protected from contamination and returned to the manufacturer, reused, or recycled, if possible.

SOIL CHARACTERIZATION

One composite soil sample per 500 cubic yards of excavated soil will be collected for waste characterization. Composites will be comprised from no more than six (6) discreet grab samples. The following laboratory analysis will be completed to characterize the stockpiled or stored soil prior to its removal offsite:

- Title 22 metals (17 metals) by EPA Method 6010B/7471A
- VOCs by EPA Method 8260B
- Total petroleum hydrocarbons (TPH) by EPA Method 8015B
- OCPs by EPA Method 8081A
- Asbestos by PLM

SOIL TRANSPORTATION AND DISPOSAL

The excavated soil placed in roll-off bins or stockpiled onsite will be loaded into the transport trucks. The soil will be covered with secured tarps according to applicable Department of Transportation (DOT) regulations to prevent soil from spilling during transport to the disposal facility. Prior to departure, the general contractor will ensure that loose soil debris is removed from trucks by dry brushing the tires and truck body. Trackout will be controlled and soil will not be allowed to be deposited onto city streets. If trackout control becomes an issue, the Contractor will utilize a street sweeper to clean and maintain the offsite truck egress point.

DOT-approved, placarded end-dump or bottom-dump trucks will transport excavated soil to the appropriate offsite disposal facility. The number of vehicles to be used for soil loading and transport will be minimized to avoid generating excess decontamination wastes. Waste haulers will be required to provide proof of valid registrations and permits for waste transport to Class II and III facilities. The vehicles will be properly registered, operated, and placarded in compliance with local, state, and federal requirements.

4.6 ENVIRONMENTAL MONITORING

Air monitoring equipment and dust control measures will be used to monitor and

reduce the amount of airborne particulate matter (fugitive dust) resulting from earth-moving activities onsite. Air monitoring will be conducted at 15-minute intervals, unless it is determined that air monitoring may occur at less frequent intervals. These less frequent intervals would be the result of ambient air movement (wind) or through the reduction of the air threat through verification monitoring. The change in the monitoring interval will be logged. Measurements will be taken at the anticipated source and in the breathing zone of the onsite personnel.

WIND MONITORING

Wind speed and wind direction will be monitored at 15-minute intervals using a tripod-mounted weather station.

PARTICULATE MONITORING

Monitoring for concentrations of particulate matter with an aggregate particle diameter of 10 microns or less (PM10) at the Site will be conducted with aerosol monitors near the property boundary at locations upwind (one) and downwind (one) of excavation activities. The monitors shall provide real-time concentration and median particle size information and will log the data for the duration of the monitoring period. The aerosol monitors used shall be capable of logging data at 1-minute intervals or less.

The dust monitors shall be zeroed daily. An action level of 25 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) (per Rule 1466) shall be established, measured as the difference between upwind and downwind monitors.

DUST CONTROL

Under the provisions of SCAQMD Rule 403 – Fugitive Dust, owners/operators of facilities or projects are required to limit emissions of fugitive dust generated by their activities. Specifically, the contractor is responsible for meeting requirements specified in Rule 403 and implementing reasonable Best Available Control Measures (BACM) to minimize dust emissions. The SCAQMD has a threshold of 150 pounds per day of PM10. The following dust control measures shall be implemented to stabilize exposed surfaces and minimize suspended or tracked dust particles:

- Apply water to excavation areas to minimize dust generated by vehicles, trucks, and heavy equipment.
- Apply water to the staged soil piles before and during loading of trucks, and after completion of loading for the day.
- Adequately tarp truck trailers, and clean truck tires as necessary prior to leaving the Site. Place shaker plates on the ingress and egress routes to the Site.
- Cover and secure staged soil piles at the end of each day.

4.7 COMPLIANCE INSPECTIONS

Periodic site inspection of the excavations, or other soil disturbance activities will be conducted by the Environmental Consultant or designated Soils Manager to determine if any failed compliance has occurred. Stop-work orders will be promptly issued if any failed compliance has occurred and corrective actions will be

immediately implemented to address the non-compliant issue.

4.8 DUST CONTROL PLAN

Dust is defined as solid particles, or particulate matter, which are predominately large enough to eventually settle out from the air but are small enough to remain temporarily suspended in the air for an extended period of time. Dust from sites performing earthmoving activities (including excavation, backfilling, and grading) can originate from exposed soil surfaces, excavation activities, grading, unprotected soil stockpiles, demolition, traffic on unpaved surfaces, etc.

The general dust control requirement is for no visible dust to exit the Site during construction. Measures will be taken to monitor and minimize fugitive dust generation to protect workers and neighbors and to limit contaminant distribution outside work areas.

Primary dust control will be achieved by utilizing work process controls and through the application of water for suppression of dust. Sufficient water will be applied to truck routes and work areas to keep the Site soils adequately wetted without generating runoff, erosion, or unacceptable conditions relating to storm water controls. In general, dust control will include application of water every two hours of active operation, or sufficiently often to keep the area adequately wetted.

Wind speed and direction will be monitored using a portable calibrated anemometer. Excavation activities will not be conducted when the average wind speed is >15 miles per hour (mph) for over 15 minutes, or when the wind speed gusts exceed 25 mph.

Should fugitive dust be visible at the downwind limits of the work zone, additional dust suppression measures will be conducted to mitigate fugitive dust generation. If the additional measures are not effective at controlling offsite migration of fugitive dust, work will be stopped until more effective means of dust suppression can be implemented.

Any visible track-out on a paved public road where vehicles enter and exit the work area must be removed at the end of the workday or at least once per day. Removal will be accomplished by using a wet sweeping or vacuum device in accordance with SCAQMD requirements.

4.9 SOIL DISPOSAL

Selection of the permitted disposal facility will be based on the results of the analytical testing of the stockpiled/stored soils intended for offsite disposal and approval from LAUSD. At a minimum, excavated site soils intended for offsite disposal will be taken to a Class III landfill. All disposal facility decisions will be based on actual analytical results and landfill profile acceptance.

5.0 LIMITATIONS

CES Group warrants that the services, findings, and/or recommendations provided have been prepared, performed and rendered in accordance with procedures, practices and standards generally accepted and customary in the consultant's profession for use in

similar assignments. This project was performed using the same degree and skill expected of similar firms practicing in similar situations or localities. The statements in this report are based on field observations and limited analytical results and represent professional opinions. No investigation is sufficient to determine with absolute certainty whether a site is completely free of risk. This study was a focused investigation and consequently CES Group does not provide any warranty that contamination is not present at the property, that the property is suitable for any particular purpose or that the property is clean or free of liability. No warranty is expressed or implied regarding conditions at locations other than those tested. Additionally, the passage of time may result in a change in the environmental characteristics at this site and surrounding properties. The work performed in conjunction with this assessment and the data developed are intended as a description of available information on the dates and at the locations given. This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated.

If you have any questions regarding this Soil Removal Plan, please contact me at 714-398-6363 or sgreen@cesgroup.co.

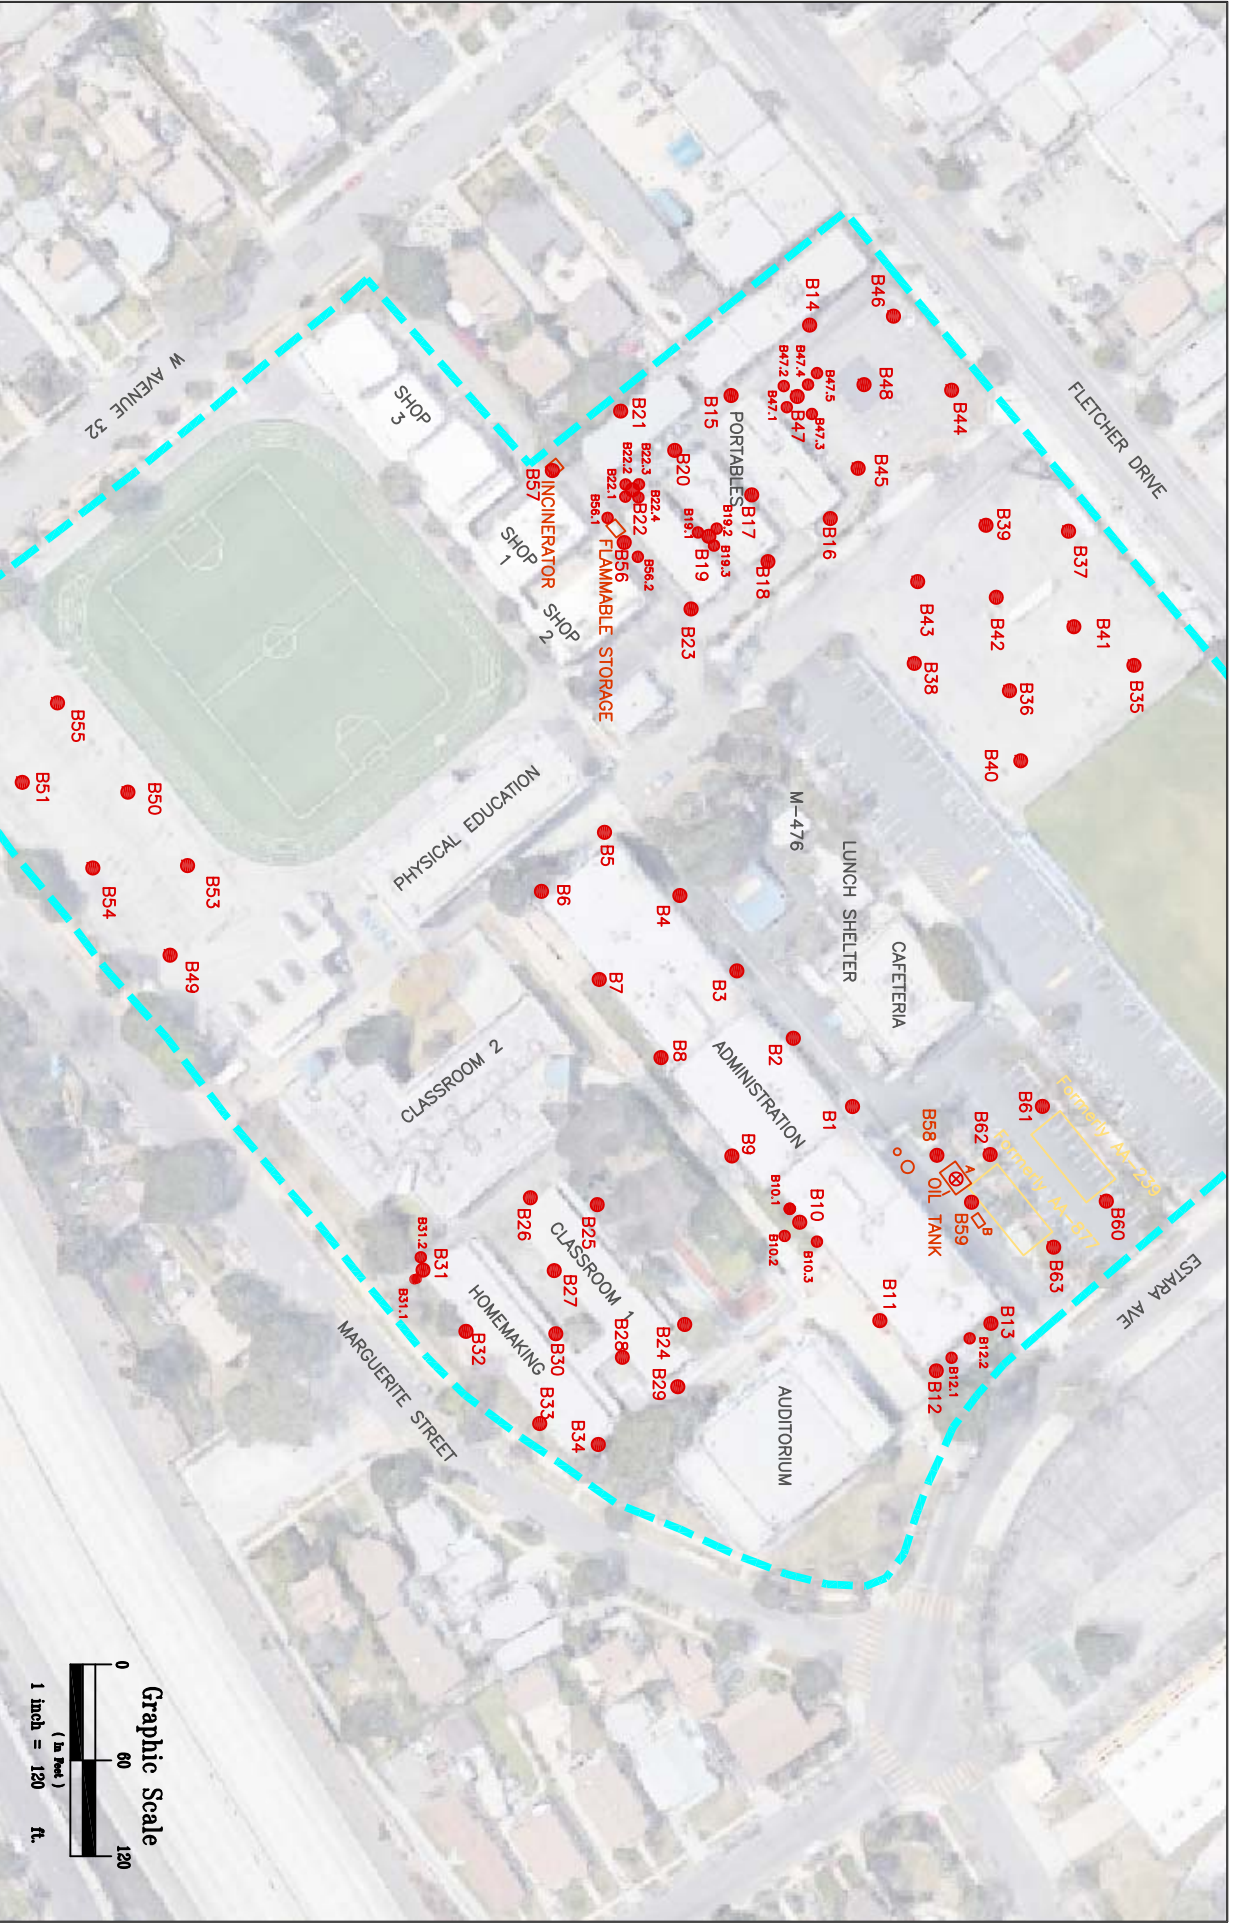

Thank you,

The image shows a handwritten signature in black ink, which appears to read "Skye Green". To the right of the signature is a circular professional engineer seal. The seal contains the following text: "PROFESSIONAL ENGINEER" at the top, "SKYE M. GREEN" in the center, "No. C63758" below the name, "Exp. 9/30/24" below the number, "CIVIL" below the expiration date, and "STATE OF CALIFORNIA" at the bottom.

July 2024

EXECUTIVE SUMMARY

This Historic Resources Technical Report (HRTR), in support of the Irving Middle School Major Modernization Project, addresses an 11.2-acre study area located at 3010 Estara Avenue, City of Los Angeles, Los Angeles County, California, within the U.S. Geological Survey Los Angeles topographic quadrangle.¹ This evaluation was prepared to determine the historical resource/historic property status of original buildings on the Washington Irving Middle School (Irving MS) Campus, both individually as buildings over 50 years of age, and as potential contributors to a historic district to facilitate Los Angeles Unified School District (LAUSD) compliance with CEQA.

The report concurs with the findings in the *Historic Resources Evaluation Report: Irving Middle School* (HRER) that six buildings on the campus appear to be eligible as a City of Los Angeles historic district, and that none of these contributors appear individually eligible. This portion of the campus is eligible under the National Register of Historic Places (NRHP) and California Register of Historical Resources (CRHR) Criteria A/1 and C/3, as a City of Los Angeles Historic Cultural Monument (HCM) under Criteria 1 and 3 and, therefore, is a historical resource pursuant to the California Environmental Quality Act (CEQA).²

The analysis indicates that six buildings on the Irving MS Campus are eligible for historic designation as City of Los Angeles landmarks, not individually, but as contributors to the Irving Middle School Campus Historic District. The proposed Project includes the demolition of the Administration Building, an action that would weaken but not invalidate the eligibility of the Campus as a historic district. Under CEQA, demolition of the Administration Building would constitute a less than significant impact to the historic district. The five remaining historic buildings would remain in place and continue to convey the historic significance of the district.

In accordance with the *LAUSD Historic Context Statement, 1870 to 1969* (HCS),⁴ the historic portion of the school campus currently retains all essential physical features from the period of significance, 1936–1939. Therefore, Sapphos Environmental, Inc. recommends that Washington Irving Middle School Historic District continue to be eligible as a historical resource, even if the Administrative Building were to be demolished as planned.

SECTION 1.0 INTRODUCTION

1.1 PURPOSE AND SCOPE

Sapphos Environmental, Inc. was retained by the Los Angeles Unified School District (LAUSD) to prepare a Historic Resources Technical Report (HRTR) to evaluate the environmental impacts of the Irving Middle School Major Modernization Project (proposed Project) on historical resources as defined pursuant to Section 15064.5(a) of the California Environmental Quality Act (CEQA) Guidelines. Washington Irving STEAM Magnet School (originally Verdugo Road Junior High School) in Los Angeles, California, was constructed in 1936 by the Public Works Administration (PWA). The original buildings include the main building, a cafeteria, a gymnasium with two bas-relief sculptures near the roof, and an auditorium containing a Federal Art Project (FAP) mural by Ivan Bartlett. All these structures are still standing. The school is one of many schools in the LAUSD school system that were built or remodeled by New Deal agencies in the wake of the devastating 1933 Long Beach Earthquake. Irving Middle School (Irving MS) is a classic example of the PWA Moderne style. Section 15064.5(b)(1) and (2) specify that the significance of a historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics (also referred to as the character-defining features) of a historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources (CRHR). The eligible resources on the Campus and their character-defining features were previously identified in the *Historic Resources Evaluation Report: Irving Middle School* (HRER).⁵ This analysis is focused exclusively on significant impacts of the proposed Project on cultural resources in relation to historical resources. The analysis does not evaluate the potential for significant impacts on cultural resources in relation to adverse effects on prehistoric archaeological resources or Tribal Cultural Resources. It is understood that LAUSD is responsible for consultation with Native American Most Likely Descendants, pursuant to Assembly Bill (AB) 52, and related identification and evaluation of Tribal Cultural Resources.

1.2 PROJECT LOCATION

The Project site is located at 3010 W. Estara Avenue (Assessor Parcel Numbers [APNs] 5458-019-900 [main parcel], 5458-018-903 [southwest of Moss Avenue], 5458-018-904, 5458-018-905, 5458-018-906, 5458-018-907, 5458-018-908, 5458-018-909, 5458-018-910, 5458-018-911, 5458-018-912, 5458-018-913, 5458-018-914, 5458-018-915, 5458-018-916, and 5458-018-917) in the community of Northeast Los Angeles (neighborhood of Glassell Park) within the City of Los Angeles in Los Angeles County, California (Figure 1-1, *Location Map*). The Project site does not include the two former City streets (Moss Avenue and Roswell Street) that divide the Project site; LAUSD has a revocable permit to occupy the City right-of-way that runs through this portion of the Campus and no changes are proposed within it. Major features in the Project area include the Glendale Freeway (State Route 2) to the south, the Los Angeles River approximately 0.6 mile to the southwest, and the San Rafael Hills and Verdugo Mountains to the north. Most of Forest Lawn Memorial Park falls within the neighborhood boundary. Irving MS is a Science Technology Engineering Arts and Mathematics (STEAM) magnet school situated on an irregular 11.2-acre campus bounded by Fletcher Drive to the northwest, Estara Avenue to the northeast, Marguerite

⁵ ASM Affiliates, Inc. 2022. Historic Resource Evaluation Report: Irving Middle School, Los Angeles, California. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety.

Street to the southeast, and West Avenue 32 to the southwest, placing the school in LAUSD's Region West, Glassell Park & Los Feliz Community of Schools.

The Irving MS Campus encompasses 17 buildings, of which 11 are permanent and 6 are relocatable (Figure 1-3, *Campus Map*). Of the 11 permanent buildings, 3 were previously found eligible for listing on the AB 300 2002 Seismic Safety Inventory of California Public Schools Report (AB300 List). The Campus has been identified as eligible for listing as a historic district in the National Register of Historic Places (NRHP) and CRHR as well as eligible for local designation as a Historic-Cultural Monument (HCM) (Figure 1-2, *Vicinity Map, with Indication of Buildings Comprising the Historic District*) based on its post-Long Beach Earthquake middle school campus status, which embodies LAUSD school planning and design concepts of the period and as an excellent example of the PWA Moderne architectural style applied to a middle school campus.⁶ Six buildings were identified as contributors to the eligible district: the Administration Building, Auditorium, Physical Education Building, Cafeteria, Shop No. 1, and Shop No. 2, all built from 1937 to 1939 and all associated with the themes identified as significant, above.

⁶ ASM Affiliates, Inc. 2022. Final Historic Resource Evaluation Report for Irving Middle School, Los Angeles, California. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety.

Figure 1-3. Campus Map
 SOURCE: Sapphos Environmental, Inc., 2024

The immediate vicinity of the campus is a flat, multi-use zone with a mix of single- and multi-family residential structures, an elementary school, retirement home, small businesses, and mom-and-pop shops. The larger context includes Fletcher Drive Elementary School, which is located across Estara Avenue to the northeast. Residential uses are located immediately west and across Marguerite Street and Avenue 32 to the southeast and southwest, State Route 2 is located across Marguerite Street to the south, and commercial and manufacturing uses are located immediately west (Furniture Fosters and The Stash on York) and across Fletcher Drive to the northwest (The Crème Shop, Mendez Tax Services, Love Your Hair, Julie’s Market, Viet on Fletcher, Birds Auto Detail and Ceramic Coatings, R B Signs, Zumba, Fresh Pup Cuts, Los Angeles World Embroidery & School Uniforms, Olivares flower and party shop, and El Ranchito Meat Market). Forest Lawn Memorial Park – Glendale is north of the subject property and nearby, three blocks away. To the east, the 2 Freeway interrupts residential areas flanking the freeway; Eagle Rock Boulevard and the Glassell Park recreational areas lie to the east of the freeway. To the south, the area changes with the Ribet Academy and playing fields and various retail, commercial, and industrial buildings and services, extending to the east along San Fernando Boulevard.

1.3 PROJECT PURPOSE AND DESCRIPTION

The purpose of the proposed Project is to address critical issues of safety and physical condition requiring construction, modernization, and/or repair to school facilities, while ensuring compliance with local, state, and federal regulations. LAUSD is proposing a major modernization of Irving MS to address the most critical physical needs of the buildings and grounds at the Campus through replacement, renovation, modernization, and reconfiguration. The primary objective of the proposed Project is to address the most critical physical conditions and essential safety by alleviating seismic and structural risks discovered on the Campus. The proposed Project is included in the Measure RR Proposed Implementation Plan (Implementation Plan) to modernize, upgrade, and/or reconfigure seven schools with the most critical need for infrastructure improvement, based on physical conditions. The proposed Project would address physical conditions and safety issues and modernize Irving MS in alignment with its instructional program. The following components may be included in the proposed Project, although components are not limited to this list:

- New construction of approximately 19 general and specialty classrooms and support spaces, library, administration space, and maintenance and operations spaces.
- Seismic retrofit to the existing Auditorium.
- Installation of relocatable buildings to accommodate the City of Angels Program.
- Associated landscape, hardscape, parking improvements, and infrastructure upgrades including, but not limited to, sanitary sewer, water, stormwater, and electrical utilities.
- Demolition of the Administration Building, One-Story Classroom Building, Homemaking Building, and six relocatable buildings.
- Interim facilities, as required.
- Improvements to ensure compliance with the Americans with Disabilities Act (ADA), Division of the State Architect (DSA), CEQA, Department of Toxic Substances Control (DTSC), or other local, state, and federal requirements.

SECTION 2.0

REGULATORY FRAMEWORK

The regulatory framework outlined in this section structures the assessment of potential impacts to historical resources under CEQA, as part of the environmental review process for the proposed Project. Buildings on the Irving MS Campus were previously evaluated in 2022 to determine whether they constitute historical resources as defined by CEQA, using the following eligibility criteria for listing in applicable federal, state, and local statutes and regulations.⁷

2.1 FEDERAL

National Historic Preservation Act⁸

Enacted in 1966 and most recently amended in 2000, the National Historic Preservation Act (NHPA) declared a national policy of historic preservation and instituted a multifaceted program, administered by the Secretary of the Interior, to encourage the achievement of preservation goals at the federal, state, and local levels. The NHPA authorized the expansion and maintenance of the National Register of Historic Places (NRHP), established the position of State Historic Preservation Officer (SHPO) and provided for the designation of State Review Boards, set up a mechanism to certify local governments to carry out the purposes of the NHPA, assisted Native American tribes in preserving their cultural heritage, and created the Advisory Council on Historic Preservation (ACHP). Section 106 of the NHPA states that federal agencies with direct or indirect jurisdiction over federally funded, assisted, or licensed undertakings must take into account the effect of the undertaking on any historic property that is included in or eligible for inclusion in the NRHP, and that the ACHP must be afforded an opportunity to comment, through a process outlined in the ACHP regulations at 36 Code of Federal Regulations (CFR) Part 800, on such undertakings. No federal involvement is included in the Irving MS Major Modernization Project; therefore, the Section 106 process is not applicable.

National Register of Historic Places

The NRHP was established by the NHPA of 1966 as “an authoritative guide to be used by Federal, State, and local governments, private groups and citizens to identify the Nation’s cultural resources and to indicate what properties should be considered for protection from destruction or impairment.”⁹ The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must also possess integrity of location, design, setting, materials, workmanship, feeling, and association. A property is eligible for the NRHP if it is significant under one or more of the following criteria:¹⁰

Criterion A: It is associated with events that have made a significant contribution to the broad patterns of our history;

⁷ ASM Affiliates, Inc. 2022. Historic Resource Evaluation Report: Irving Middle School. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety.

⁸ United States Code, 16 USC 470.

⁹ Code of Federal Regulations, 36 CFR 60.2.

¹⁰ Code of Federal Regulations, 36 CFR 60.4.

Criterion B: It is associated with the lives of persons who are significant in our past;

Criterion C: It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; and/or

Criterion D: It has yielded, or may be likely to yield, information important in prehistory or history.

Ordinarily, cemeteries, birthplaces, or graves of historical figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, and properties that are primarily commemorative in nature, are not considered eligible for the NRHP, unless they satisfy certain conditions. In general, a resource must be 50 years of age to be considered for the NRHP, unless it satisfies a standard of exceptional importance.

Secretary of the Interior's Standards for the Treatment of Historic Properties

Evolving from the *Secretary of the Interior's Standards for Historic Preservation Projects with Guidelines for Applying the Standards* developed in 1976,¹¹ the *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings* was published in 1995 and codified as 36 CFR 67.¹² Neither technical nor prescriptive, these standards and guidelines are "intended to promote responsible preservation practices that help protect our Nation's irreplaceable cultural resources" by addressing four treatments for historic properties: preservation, rehabilitation, restoration, and reconstruction.¹³ "Preservation" acknowledges a resource as a document of its history over time, and emphasizes stabilization, maintenance, and repair of existing historic fabric. "Rehabilitation," while also incorporating the retention of features that convey historic character, also accommodates alterations and additions to facilitate continuing or new uses. "Restoration" involves the retention and replacement of features from a specific period of significance. "Reconstruction," the least used treatment, provides a basis for recreating a missing resource. These standards have been adopted, or are used informally, by agencies at all levels of government to review projects that affect historic resources.

2.2 STATE OF CALIFORNIA

California Environmental Quality Act¹⁴

Pursuant to CEQA, a historic resource is a resource listed in, or eligible for listing in, the CRHR. Historical resources included in a local register of historic resources, or those identified as significant in a local survey conducted in accordance with state guidelines, are also considered

¹¹ National Park Service. 1976. *Secretary of the Interior's Standards for Historic Preservation Projects with Guidelines for Applying the Standards*.

¹² National Park Service. 1995. *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings*.

¹³ Weeks, Kay D., and Anne E. Grimmer. 1995. *The Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings*. U.S. Department of the Interior, National Park Service.

¹⁴ California Public Resources Code, Division Thirteen, Statutes 21083.2, 21084.1.

historic resources under CEQA, unless a preponderance of the facts demonstrates otherwise. According to CEQA, the fact that a resource is not listed in or determined eligible for listing in the CRHR or is not included in a local register or survey shall not preclude a lead agency, as defined by CEQA, from determining that the resource may be a historic resource, as defined in California Public Resources Code (PRC) Section 5024.1.¹⁵

Under CEQA, a project with an effect that may cause a substantial adverse change in the significance of a historic resource may have a significant effect on the environment, requiring that the lead agency identify potentially feasible mitigation measures to reduce or eliminate the adverse effect.¹⁶ The State CEQA Guidelines state that substantial adverse change includes “physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired (§15064.5 (b)(1)),” with material impairment occurring when a project (§15064.5 (b)(2)):

- (A) Demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, inclusion in the California Register of Historical Resources; or
- (B) Demolishes or materially alters in an adverse manner those physical characteristics that account for its inclusion in a local register of historical resources pursuant to section 5020.1(k) of the Public Resources Code or its identification in an historical resources survey meeting the requirements of section 5024.1(g) of the Public Resources Code, unless the public agency reviewing the effects of the project establishes by a preponderance of evidence that the resource is not historically or culturally significant; or
- (C) Demolishes or materially alters in an adverse manner those physical characteristics of a historical resource that convey its historical significance and that justify its eligibility for inclusion in the California Register of Historical Resources as determined by a lead agency for purposes of CEQA.

California Register of Historical Resources

Created in 1992 and implemented in 1998, the CRHR is “an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state’s historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change.”¹⁷ Certain properties, including those listed in or formally determined eligible for listing in the NRHP and California Historical Landmarks numbered 770 and higher, are automatically included in the CRHR. Other properties recognized under the California Points of Historical Interest program, identified as significant in historic resources surveys or designated by local landmarks programs, may be nominated for inclusion in the CRHR. A resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:¹⁸

¹⁵ California Code of Regulations, Title 14, Chapter 3. CEQA Guidelines. Section 15064.5(a).

¹⁶ California Code of Regulations, Title 14, Chapter 3. CEQA Guidelines. Section 15064.5(b).

¹⁷ California Public Resources Code, Section 5024.1(a).

¹⁸ California Public Resources Code, Section 5024.1(c).

- Criterion 1: It is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage.
- Criterion 2: It is associated with the lives of persons important in our past.
- Criterion 3: It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- Criterion 4: It has yielded, or may be likely to yield, information important in history or prehistory.

Resources nominated to the CRHR must retain enough of their historic character or appearance to be recognizable as historic resources and to convey the reasons for their significance.¹⁹ It is possible that a resource whose integrity does not satisfy NRHP criteria may still be eligible for listing in the CRHP. Similarly, resources that have achieved significance within the last 50 years may be eligible for inclusion in the CRHR provided that enough time has lapsed to obtain a scholarly perspective on the events or individuals associated with the resource.²⁰

2.3 CITY OF LOS ANGELES

In Los Angeles, Historic-Cultural Monument designation is reserved for those places that have “unique aesthetic, architectural, cultural or historic value to the City of Los Angeles.”²¹ Ordinance No. 185472 (2018)—amending Section 22.171 of Article 1, Chapter 9, Division 22 of the Los Angeles Administrative Code—clarifies historic-cultural monument designation criteria as follows:²²

A Historic-Cultural Monument is any site (including significant trees or other plant life located thereon), building, or structure of particular historical or cultural significance to the City of Los Angeles, which meets at least one of the following criteria:

1. Is identified with important events of national, state, or local history, or exemplifies significant contributions to the broad cultural, economic or social history of the nation, state, city or community;
2. Is associated with the lives of historic personages important to national, state, city, or local history; or
3. Embodies the distinctive characteristics of a style, type, period, or method of construction; or represents a notable work of a master designer, builder, or architect whose individual genius influenced his or her age.

²² Los Angeles Department of City Planning. 2018. Cultural Heritage Ordinance No. 185472. https://planning.lacity.org/odocument/f740b82d-c0e6-451c-a99f-d36f1ff262a9/Cultural_Heritage_Ordinance_Revised_2018.pdf (accessed October 10, 2023).

A proposed Monument may be designated by the City Council upon the recommendation of the Commission if it meets at least one of the above criteria.

2.4 LAUSD STANDARD CONDITIONS OF APPROVAL

The proposed Project, along with all other LAUSD School Upgrade Program (SUP)–related projects, is required to comply with specific design standards and sustainable building practices. Certain standards assist in reducing environmental impacts, such as the California Green Building Code (CALGreen Code),²³ LAUSD Standard Conditions of Approval (SC),²⁴ and the Collaborative for High-Performance Schools (CHPS) criteria.²⁵

LAUSD Standard Conditions of Approval	
SC-CUL-1	<p>Historic Architect</p> <p>For projects involving structural upgrades to historic resources, the Design Team shall include a qualified Historic Architect with demonstrated project-level experience in historic projects.</p> <p>For campuses with qualifying historical resources under CEQA, the Design Team shall include an LAUSD-qualified Historic Architect. The Historic Architect/s shall meet the Secretary of the Interior’s Professional Qualifications Standards and the Standards described on page 8 of the LAUSD Design Guidelines and Treatment Approaches for Historic Schools. Throughout the project design process the Historic Architect shall provide input to ensure compliance with the Secretary of the Interior’s Standards for the Treatment of Historic Properties and LAUSD requirements and guidelines for the treatment of historical resources.</p> <p>Role of the Historic Architect</p> <p>The tasks of the Historic Architect on the Design Team shall include, but are not limited to:</p> <ul style="list-style-type: none"> • The Historic Architect shall work with the Design Team (including the Structural Engineer) and LAUSD to ensure that project components, including new construction and modernization of existing facilities, comply with the Secretary of the Interior’s Standards for the Treatment of Historic Properties and LAUSD Design Guidelines and Treatment Approaches for Historic Schools. The Historic Architect shall work with the Design Team and LAUSD throughout the design process to develop project options that facilitate compliance with the applicable historic preservation standards. • For new construction, the Historic Architect shall work with the Design Team and LAUSD to identify options and opportunities for: (1) ensuring compatibility of scale and character for new construction, site and landscape features, circulation corridors, and (2) ensuring that new construction is designed and sited in such a way that reinforces and strengthens, as much as feasible, character-defining site plan features, landscaping, and circulation corridors throughout campus.

²³ California Green Building Standards Code, Title 24, Part 11.

²⁴ Los Angeles Unified School District. 2018. Standard Conditions of Approval for District Construction, Upgrade, and Improvement Projects.

²⁵ The Board of Education’s October 2003 Resolution on Sustainability and Design of High Performance Schools directs staff to continue its efforts to ensure that every new school and modernization project in the District, from the beginning of the design process, incorporate CHPS (Collaborative for High Performance Schools) criteria to the extent possible.

	<ul style="list-style-type: none"> • For modernization and upgrade projects involving contributing (significant) buildings or features, the Historic Architect shall work with the Design Team and LAUSD to ensure that specifications for design and implementation of projects comply with the applicable historic preservation standards. • The Historic Architect shall participate in Design Team meetings during all phases of the project through 100% construction drawings, pre-construction, and construction phases, as applicable. • The Historic Architect shall prepare a memo at the 50% and at the 100% construction drawings stages, demonstrating how principal project components and treatment approaches comply with applicable historic preservation standards, including the Secretary of the Interior's Standards for the Treatment of Historic Properties and LAUSD Design Guidelines and Treatment Approaches for Historic Schools. The memos shall be submitted to LAUSD OEHS for review. • The Historic Architect shall participate in pre-construction and construction monitoring activities, as appropriate, to ensure continuing conformance with the Secretary's Standards and/or avoidance of a material impairment of the historical resources. • The Historic Architect shall provide specifications for architectural features or materials requiring restoration or removal, maintaining and protecting relevant features in place, or on-site storage. Specifications shall include detailed drawings or instructions where historic features may be impacted. • The Design Team and Historic Architect shall be responsible for incorporating LAUSD's recommended updates and revisions during the design development and review process.
<p>SC-CUL-2</p>	<p>LAUSD shall follow the guidelines outlined in these documents to the maximum extent practicable when planning and implementing projects and adjacent new construction involving historical resources.</p> <p>The Design Team, Historic Architect, and Construction Contractor shall apply LAUSD School Design Guidelines and Treatment Approaches for Historic Schools and the Secretary's Standards for all new construction and modernization projects. In keeping with the District's adopted policies and goals, historical resources shall be reused rather than destroyed, where feasible.</p> <p>General guidelines include:</p> <ul style="list-style-type: none"> • Retain and preserve the character of historic resources. • Repair rather than remove, replace, or destroy character-defining features; if replacement is necessary, replace in-kind to match materials, dimensions, and appearance. • Treat distinctive architectural features or examples of skilled craftsmanship that characterize a building with sensitivity. • Where practical, conceal reinforcement required for structural stability or the installation of life safety or mechanical systems. <ul style="list-style-type: none"> • Where necessary to halt deterioration and after the preparation of a condition assessment, undertake surface cleaning, preparation of surfaces, and other projects involving character-defining features using the least invasive, gentlest means possible. Avoid using any abrasive materials or methods including sandblasting and chemical treatments.
<p>SC-CUL-3</p>	<p>Prior to any major alteration to a historic or adjacent resource that may potentially damage historic resources (or previously identified historic features), the Historic Architect shall develop a Temporary Protection Plan that identifies potential risks to the historic resource. The Temporary Protection Plan shall be prepared in coordination with the Construction Contractor and LAUSD prior to demolition or construction. The Temporary Protection Plan may include, but not be limited to, the following components:</p>

	<ul style="list-style-type: none"> • Notation of the historic resource on construction plans. • Pre-construction survey to document the existing physical condition of the historic resource. • Procedures and timing for the placement and removal of temporary protection features, around the historic resource. • Monitoring of the installation and removal of temporary protection features by the Historic Architect, or designee. • Post-construction survey to document the condition of the historic resource after Project completion. • Preparation of a technical memorandum documenting the pre-construction and post-construction conditions of the historic resource and compliance with protective measures outlined in the Temporary Protection Plan.
SC-CUL-4	<p>Prior to significant alteration or demolition of a historical resource, LAUSD shall retain an Architectural Photographer and/or a Historian or Architectural Historian who meet the Secretary of the Interior's Professional Qualifications Standards and who shall prepare a HABS-like Historic Documentation Package (Package).</p> <p>The Package shall include photographs and descriptive narrative. Documentation will draw upon primary- and secondary-source research including available studies prepared for the property (measured drawings are not required). The specifications for the Package include:</p> <ul style="list-style-type: none"> • Photographs: Photographic documentation shall focus on the historical resources/features proposed to be significantly altered or demolished, with overview and context photographs for the campus and adjacent setting. A professional-quality camera will be used to take photographs of interior and exterior features of the buildings. Photographs will include context views, elevations/exteriors, architectural details, overall interiors, and interior details (if warranted). Digital photographs will be in black and white (as well as in color or as requested by the District) and provided in an electronic format. • Descriptive and Historic Narrative: The Historian or Architectural Historian shall prepare a descriptive and historic narrative of the historical resources/features. Physical descriptions will detail each resource, elevation by elevation, with accompanying photographs and information on how the resource fits within the broader campus during its period of significance. The historic narrative will include available information on the campus design, history, architect/contractor/designer as appropriate, history of the area, and historic context. In addition, the narrative will include a methodology section specifying the name of researcher, date of research, and sources/archives visited, as well as a bibliography. Within the written history, statements shall be footnoted as to their sources, where appropriate. <p>Historic Documentation Package Submittal: Upon completion of the descriptive and historic narrative, all materials will be compiled in electronic format and presented to LAUSD for review and comment. Upon approval, one electronic copy and one hard copy shall be submitted to LAUSD OEHS. Photographs will be individually labeled and provided to LAUSD in electronic format.</p>
SC-CUL-5	<p>LAUSD shall comply with Design Specification 01 3591, Historic Treatment Procedures, as applicable. This Specification requires the Construction Contractor to submit a Historic Treatment Plan to the District for the protection, repair, and replacement of historic materials and features.</p>
SC-CUL-6	<p>LAUSD shall retain a qualified Archaeologist to be available on-call. The Archaeologist shall meet the Secretary of the Interior's Professional Qualifications Standards (48 Federal Register 44738–39). The archaeologist must have knowledge of both prehistoric and historical archaeology.</p> <p>To reduce impacts to previously undiscovered buried archaeological resources, following completion of the final grading plan and prior to any ground disturbance, a qualified</p>

	archaeologist shall prepare an Archaeological Monitoring Program as described under SC-CUL-7.
SC-CUL-7	<p>The Construction Contractor shall halt construction activities within a 30 foot radius of the find and shall notify the LAUSD.</p> <ul style="list-style-type: none"> • LAUSD shall retain an Archaeologist that meets the Secretary of the Interior's Professional Qualifications Standards (48 Federal Register 44738–39). The archaeologist must have knowledge of both prehistoric and historical archaeology. • The Archaeologist shall have the authority to halt any project-related construction activities that could impact potentially significant resources. • The Archaeologist shall be afforded the necessary time to recover and assess the find. Ground-disturbing activities shall not continue until the discovery has been assessed by the Archaeologist. With monitoring, construction activities may continue on other areas of the project site during evaluation and treatment of historic or unique archaeological resources. • If the find is determined to be of value, the Archaeologist shall prepare an Archaeological Monitoring Program and shall monitor the remainder of the ground-disturbing activities. • Significant archaeological resources found shall be curated as determined necessary by the Archaeologist and offered to a local museum or repository willing to accept the resource. • Archaeological reports shall be submitted to the South Central Coastal Information Center at the California State University, Fullerton. • The Archaeological Monitoring Plan shall include: <ul style="list-style-type: none"> ○ Extent and duration of the monitoring based on the grading plans ○ At what soil depths monitoring of earthmoving activities shall be required ○ Location of areas to be monitored ○ Types of artifacts anticipated ○ Procedures for temporary stop and redirection of work to permit sampling, including anticipated radius of suspension of ground disturbances around discoveries and duration of evaluation of discovery to determine whether they are classified as unique or historical resources ○ Procedures for maintenance of monitoring logs, recovery, analysis, treatment, and curation of significant resources ○ Procedures for archaeological resources sensitivity training for all construction workers involved in moving soil or working near soil disturbance, including types of archaeological resources that might be found, along with laws for the protection of resources. The sensitivity training program shall also be included in a worker's environmental awareness program that is prepared by LAUSD with input from the Archaeologist, as needed. ○ Accommodation and procedures for Native American monitors, if required. ○ Procedures for discovery of Native American cultural resources. • The construction manager shall adhere to the stipulations of the Archaeological Monitoring Plan.
SC-CUL-8	Cultural resources sensitivity training shall be conducted for all construction workers involved in ground-disturbing activities. This training shall review the types of archaeological resources that might be found, along with laws for the protection of resources and shall be included in a worker's environmental awareness program that is prepared by LAUSD with input from a qualified Archaeologist, as needed.
SC-CUL-9	LAUSD shall determine whether it is feasible to prepare and implement a Phase III Data Recovery/Mitigation Program. If feasible, the Archaeologist shall prepare a Phase III Data Recovery/Mitigation Program to outline procedures to recover a statistically valid sample of the archaeological remains and to document the site and reduce impacts to be less than significant. All documentation shall be prepared in the standard format of the ARMR

	Guidelines, as prepared by the OHP. Once a Phase III Data Recovery/Mitigation Program is completed, an Archaeological Monitor shall be present to oversee the ground-disturbing activities to ensure that construction proceeds in accordance with the Program.
SC-CUL-10	All work shall stop within a 30-foot radius of the discovery. Work shall not continue until the discovery has been evaluated by a qualified Archaeologist and the local Native American representative has been contacted and consulted to assist in the accurate recordation and recovery of the resources.
SC-CUL-11	<p>LAUSD shall retain a Paleontological Monitor to oversee specific ground-disturbing activities as determined by the scope of work and final grading plan. The Monitor shall provide the construction crew(s) with a brief summary of the sensitivity, the rationale behind the need for protection of these resources, and information on the initial identification of paleontological resources.</p> <p>If paleontological resources are uncovered, the Construction Contractor shall halt construction activities within a 30-foot radius of the find and shall notify the LAUSD.</p> <ul style="list-style-type: none"> • Ground-disturbing activities shall not continue until the discovery has been assessed by the Paleontologist. • The paleontologist shall have the authority to halt construction activities to allow a reasonable amount of time to identify potential resources. • Significant resources found shall be curated as determined necessary by the Paleontologist.

2.5 SECRETARY OF THE INTERIOR STANDARDS FOR REHABILITATION

While the LAUSD Design Guidelines and Treatment Approaches for Historic Schools²⁶ provides guidance regarding treatments to historic schools, including a general description of the goals of the Secretary of the Interior's Standards (SOIS), they are stated here in their entirety for reference:

1. A property shall be used for its historic purpose or be placed in a new use that requires minimal change to the defining characteristics of the building and its site and environment.
2. The historic character of a property shall be retained and preserved. The removal of historic materials or alteration of features and spaces that characterize a property shall be avoided.
3. Each property shall be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or architectural elements from other buildings, shall not be undertaken.
4. Most properties change over time; those changes that have acquired historic significance in their own right shall be retained and preserved.
5. Distinctive features, finishes, and construction techniques or examples of craftsmanship that characterize a historic property shall be preserved.
6. Deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and other visual qualities and, where possible, materials.

²⁶ SWCA Environmental Services. 2015. LAUSD Design Guidelines and Treatment Approaches for Historic Schools. Prepared for Los Angeles Unified School District.

Replacement of missing features shall be substantiated by documentary, physical, or pictorial evidence.

7. Chemical or physical treatments, such as sandblasting, that cause damage to historic materials shall not be used. The surface cleaning of structures, if appropriate, shall be undertaken using the gentlest means possible.
8. Significant archaeological resources affected by a project shall be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.
9. New additions, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.
10. New additions and adjacent or related new construction shall be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

3.1 LITERATURE REVIEW

Prior to the commencement of field investigations, previous documentation of historic resources in the City of Los Angeles (City) was reviewed, including the LAUSD HCS, historic resource surveys, and survey report for the Northeast Los Angeles Community Plan Area (CPA), databases and historic newspapers, Los Angeles County Assessor's Maps, Los Angeles Zoning Information Map Access Systems (ZIMAS), and Sanborn Maps. In addition, the listings for the City in the California Historical Resources Inventory, which is maintained by the Office of Historic Preservation (OHP) in Sacramento and available through the South Central Coastal Information Center (SCCIC) in the Department of Anthropology at California State University at Fullerton, were examined. Site-related correspondence from OHP to the City, provided by LAUSD, was taken into account. Additional research on the history of the City and the development of the CPA was undertaken using a variety of online sources. The final list of sources is included in this report as Section 7, *References*.

Primary source materials, including previous cultural records reports (focused studies), city ordinances, state of California building codes, and LAUSD architecture guidelines, were reviewed for this investigation as provided below:

3.2 HISTORIC RESOURCES SURVEY

On December 18, 2023, Sapphos Environmental, Inc. (Graham Larkin) performed a field inspection of the proposed Project site. Each building on the Irving MS Campus was inspected and digitally photographed from the public right-of-way. A table listing each property with its date of construction, obtained from the Los Angeles County Tax Assessor, was compiled (see Table 5-1, *Field Survey Results for Irving MS Campus*). Initial determinations of potential historical significance were made, based on the age, integrity, architectural character, and historical context of each building. Site-specific research was performed. Potential resources were evaluated using the criteria of significance for the NRHP and the CRHR, and California Historical Resource status codes were assigned, indicating whether or not each property was eligible for listing. The results of the survey are presented in Section 5, *Historic Resources Assessment*.

SECTION 4

HISTORIC CONTEXT

4.1 HISTORY OF GLASELL PARK

Historically, the areas that comprise the present-day City of Los Angeles were home to the Chumash and Tongva Native American tribes. El Pueblo de Nuestra Señora la Reina de los Ángeles de Porciúncula (El Pueblo de Los Angeles) was founded as a farming community by a group of 44 settlers from present-day northern Mexico (central New Spain) in 1781.²⁷ Sovereignty in the area changed from Mexico to the United States in 1849. A population boom started in 1885, after the Santa Fe railroad line connected Chicago to Los Angeles. In the late 1700s, land between the Los Angeles River and the Arroyo Seco was given to Jose Maria Verdugo by Spanish Governor Pedro Fages. Over 30,000 acres of this land were later purchased from the Verdugo family by attorney Alfred Beck Chapman and Andrew Glassell in 1869. The land was eventually subdivided into parcels, forming present-day communities such as Atwater Village, Highland Park, Mount Washington, Eagle Rock, and Glassell Park. By 1901, Glassell's family had sold large portions of land to the Gilchrist Investment Company, which began development on the land in the decade following. In 1912, Glassell Park was purchased again by Home and Town Builders. In the same year, a majority of the town was annexed to the City of Los Angeles as a part of the Arroyo Seco Addition. By 1916, the rest of Glassell Park was annexed to the City. Throughout the 1910s and 1920s, development continued in Glassell Park. Development of land in this era included Taylor Yards and Forest Lawn Cemetery. With development brought major roadways, such as Verdugo Road, Eagle Rock Boulevard, Fletcher Drive, and San Fernando Road. Residential spaces and single-family residences in Glassell Park typically included mostly Craftsman architectural style.²⁸

4.2 DEVELOPMENT OF THE LOS ANGELES UNIFIED SCHOOL DISTRICT

As noted in the LAUSD HCS, the history of LAUSD, founded in 1872, comprises four distinct eras within its history.²⁹ The first of these four eras is the Founding Years, taking place from the 1870s through 1909. The schools of this first era were wood-framed, one- or two-room schoolhouses, with bell towers, similar to early schools around the country in the time period. As the population in Los Angeles increased, by 1898, LAUSD expanded to include 57 facilities and almost 400 classrooms. From this era, however, only three original schoolhouses remain. Social and political reform as well as population growth changed teaching and discipline methods and eventually, larger schools were needed to accommodate larger classroom sizes and grade separation.

The Progressive Education Movement: Standardization and Expansion is the second era, from 1910 to 1933, a time during which the population expanded greatly. Public school architecture during this era mirrored philosophical reforms in education, such that the physical environment played a role in learning and addressing student needs as unique individuals, and reflected community needs, with spaces for students and the citizenry to gather. During this era, the focus on modernization and functionality of educational facilities was manifested in less monumental

²⁷ City of Los Angeles. N.d. The History of Los Angeles. <https://lacity.gov/government/history-los-angeles#:~:text=On%20September%20%2C%201781%20a,El%20Pueblo%20de%20Nuestra%20Se%C3%B1ora>

²⁸ ASM Affiliates, Inc. 2022. Historic Resource Evaluation Report: Irving Middle School. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety. P. 18.

²⁹ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for Los Angeles Unified School District, Office of Environmental Health and Safety.

building designs, connection to the outdoors, cohesive groupings of structures on spread-out campuses, and construction techniques to enhance fire and seismic safety. State and federal legislation made school compulsory for teenagers, including those in the working world, driving construction of trade schools and junior colleges in Los Angeles.

The third significant era was the Era of Reform: Great Depression, Earthquake, and Early Experiments in the Modern, Functionalist School, from 1933 to 1945. The evolution of educational architecture in this era is characterized by modern, functional, and flexible architecture in LAUSD schools; integration of classrooms with outdoor facilities; further emphasis on the role of schools in community life; and increased sophistication of building techniques. The 1933 Long Beach earthquake left intact only those schools of the previous era built under 1927 City of Los Angeles building codes. The construction boom that followed was energized, financially and in magnitude, by PWA involvement. The PWA Moderne building design style has become synonymous with LAUSD for this era. This third era continued and expanded the differentiation of spaces and buildings dedicated to different functions and site planning along with far more rigorous construction standards employing progressive technologies such as steel and glass or reinforced concrete. A “spread out” campus also was as important in this era as it was to the preceding era, with an emphasis on landscaping for outdoor gatherings and recreation between buildings that were devoted to different uses. By contrast to older, built-out East Coast cities, Los Angeles and Southern California were horizontal in nature, and with more available acreage for these expansive school plants.

The final era described by the LAUSD HCS is Educating the Baby Boom: Postwar Expansion and the Functional, Modern School, 1945 to 1969. Birthrates and migration after World War II resulted in shortages in housing and classrooms in California, creating demand for new residential and school construction, as well as repair and maintenance of older educational infrastructure. Architecture and campus design shifted towards democratic ideals around economical functionality, childhood welfare and development, and movement beyond the stylistic conventions of the past; the cultural context in which this took place included national standardization in education. With expansion of educational facilities to meet suburban needs in the mid-1940s and -1950s, downtown LAUSD school enrollment entered a decline. The LA Board of Education veered towards a traditional curriculum by 1945, which along with population expansion led to standardization in curricula, as well as school and campus architecture. Operable windows for light and fresh air became standard devices, seen in such schools such as the Francis W. Parker Elementary School, San Diego, 1921; perhaps most radically deployed in Richard Neutra’s addition to Corona Bell School in 1934, which featured whole sliding doors to link indoors and outdoors. Plans became “more open and interconnected, with more transparency and spatial complexity.”

4.3 DEVELOPMENT OF IRVING MIDDLE SCHOOL

Development of Irving MS began in 1889 when Andrew Glassell (1827–1901), after whom Glassell Park is named, built a Victorian home where Irving MS is now located. Glassell and family also owned acres of land surrounding the home and used them for agricultural groves and orchards. The City of Los Angeles purchased the Glassell House in 1936 with the intent to establish Verdugo Road District Junior High School. District manager and architect Alfred S. Nibecker Jr. recommended school projects for expansion of Irving MS. Nibecker’s responsibility for the new campus included the Administration Building, Auditorium, Gymnasium, Cafeteria, and Shop No. 1 and Shop No. 2. The Auditorium, Physical Education Building, and Administration

Building were originally designed by master architect Edwin L. Bergstrom, while the Cafeteria and Shop No. 1 and Shop No. 2 were designed by Nibecker.³⁰ As stated in the HRER,

The addition of new buildings, including two temporary shop buildings, was scheduled at a cost of \$44,000, with Nibecker as architect. [...] The architect was shown as Bergstrom, corresponding to information on the original architectural plans for the building on file at the LAUSD Vault. On the same date, a permit was issued for a Physical Education building, with Bergstrom as the architect and Laurence J. Waller as engineer. The two-story building was described as 53 by 151 feet in size.³¹

A permit for the Cafeteria was issued in 1937. The building is shown in architectural drawings as containing a Students' Dining Room, Faculty Dining Room (north corner), Serving Room, Kitchen, and Dishwashing Room. Building permits for the Cafeteria and a temporary 40-by-60-foot single-story Temporary Shop Building (Shop No. 2) show Nibecker as the architect with J. E. Byers as engineer.³²

Two rectangular shop buildings were constructed southwest of the Cafeteria. The two shops are shown in architectural drawings as identical on the exterior, with the exception of an additional small window centered between the two doors at each of the northwest and southeast elevations of Shop No. 2. The interior of Shop No. 1 originally was intended to house a print shop and a metal shop, side by side, each with separate entrances. The interior of Shop No. 2 was designed for side-by-side electric and wood shops, with the wood shop occupying slightly more space. A third shop building was designed by Bergstrom, along with the other original buildings on campus. The design showed a larger shop with exterior design elements echoing the other buildings and with metal, electric, and woodworking shops under the same roof. It appears this building was not constructed but was replaced by the two extant shops (Shop No. 1 and Shop No. 2), which were designed a year later.³³

As noted in Sections 4.1 and 4.2, the shops are very much part of the original setting and campus layout, a built reminder that acknowledges another necessary component in education at this time—the trades—that addressed the school's utilitarian needs. When the school officially opened in 1937, the name was changed to Washington Irving Junior High School. PWA Moderne architectural features and Streamline Moderne style elements were used in the design of these buildings. In the years following the creation of the school, several nearby parcels of former single- and multi-family homes, a lumberyard, grocery stores, and other buildings were bought by the school and added to the Irving MS Campus.³⁴

³⁴ ASM Affiliates, Inc. 2022. Historic Resource Evaluation Report: Irving Middle School. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety. P. 16.

4.4 SIGNIFICANT HISTORIC CONTEXTS AND THEMES

Guidelines for establishing the significance of LAUSD historic properties are outlined in the 2014 LAUSD HCS, with consideration of historic contexts and themes, associated property types, period of significance, areas of significance, and geographic location.³⁵ In accordance with the HRER,³⁶ one context/theme and one architectural style are relevant to the Irving MS campus: *Context: Public and Private Institutional Development, Education, Theme: LAUSD, Post-1933 Long Beach Earthquake School Plants, 1933–1945; and the PWA Moderne architectural styling.* Eligibility standards, character-defining features, and integrity considerations—for both individual significance and significance as a historic district—are listed below.

CONTEXT: Public and Private Institutional Development/Education³⁷

THEME: LAUSD/Post-1933 Long Beach Earthquake School Plants, 1933–1945

- Property Type: Institutional/Educational
- Property Subtypes: Elementary, Junior High, and High School Buildings and Campuses
- Period of Significance: 1933 to 1945
- Area of Significance: Education
- Geographic Location: Citywide

Eligibility Standards

- Exemplifies post–Long Beach earthquake school planning and design concepts of the period, including requirements under the 1934 Field Act
- One-story massing for elementary schools; up to two stories for middle/junior/high schools
- Retains most of the associative and character-defining features from the period of significance

Character-Defining Features Buildings/Structures

- One-story massing for elementary schools; up to two stories for middle and senior high schools
- Reinforced concrete, steel-, or wood-frame construction
- Classroom wings designed for easy access and views to outdoors—with variations including L-, H-, T-shaped building plans
- Generous expanses of windows, including steel- and wood-framed multi-light windows, awning and hopper casements, clerestories, and large-pane fixed windows; window groupings often mark the location of classrooms
- Stylistically more streamlined and less ornamental than 1920s period-revival styles
- Emphasis on “traditional Southern Californian” styles, such as Spanish Colonial and Mission Revival
- Styles can also include PWA Streamline Moderne, Art Deco, Late Moderne, and proto-modern styles

³⁵ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for Los Angeles Unified School District, Office of Environmental Health and Safety.

³⁶ ASM Affiliates, Inc. 2022. Historic Resource Evaluation Report: Irving Middle School. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety. Pp. 74–77.

³⁷ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for the LAUSD Office of Environmental Health and Safety. Pp. 137–138.

- May have been partially or fully funded through Works Progress Administration (WPA), 1935 to 1943
- WPA projects may include significant interior artwork such as murals, paintings, and sculpture
- May have been designed by a prominent architect of the period

Campus/District

- Unified site plan consisting of buildings and structures designed and sited according to their use
- Use of designed outdoor and landscaped spaces, for outdoor study, recreation, and dining
- Often displays connecting sheltered corridors throughout campus
- Emphasis on a more expansive site plan
- Varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Might include an elaborate administration building, located near the campus entrance; administration buildings usually serve as the focal point of campus
- Campus often composed of groupings of classroom wings, auditoriums, gymnasiums, cafeterias, and outdoor recreation and dining areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations

- Should retain most of the essential physical features from the period of significance
- Some materials may have been removed or altered
- Modern lighting and fencing of site acceptable
- Schools from this period generally include buildings constructed after the period of significance, in particular post–World War II buildings, which may be noncontributing
- Eligible properties under this theme may be a single building, if it exemplifies the design ideals of the era, or a grouping (campus) of buildings constructed during the period of significance
- Many pre-1933 schools were substantially remodeled following the Long Beach earthquake—may retain a 1920s plan but with 1930s stylistic detailing
- Pre-1933 schools rehabilitated post-1933 might exhibit added seismic supports of steel columns, beams, or diagonal bracing; original masonry might be covered by concrete/stucco sheathing
- Intact campus groupings from the pre-1945 era are not common
- Should retain integrity of materials, design, workmanship, feeling, and association from its period of significance

ARCHITECTURAL STYLE: PWA Moderne³⁸

The PWA was created by the National Industrial Recovery Act within months of the March 1933 Long Beach Earthquake. Los Angeles public schools faced widespread damage as a result of the earthquake, and school reconstruction work was funded heavily by the PWA. Many Los Angeles public schools built or remodeled during this time feature PWA Moderne styling to some extent. PWA Moderne, or “Stripped Classicism,” often uses elements from other stylistic traditions, such

³⁸ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety. P. 124.

as “Classical Revival, Spanish Colonial Revival, Art Deco, and Streamline Moderne.” As opposed to Streamline Moderne, PWA Moderne design features exhibit greater formality and symmetry, “with less emphasis on curvilinear shapes and horizontality.” The influence of PWA Moderne design remains evident in PWA-funded buildings across the USA today, despite termination of the PWA program in 1943.

Typical Character-Defining Features:

- Emphasis on the vertical axis
- Symmetrical, formal design composition and massing
- Smooth wall surfaces, generally exhibiting stucco, concrete, and/or polished stone (rarely includes brick exterior elements)
- Usually displays a flat roof
- Piers, often fluted or reeded, separating recessed window channels
- Incorporation of shallow relief panels and interior murals

Eligibility Standards for PWA Moderne, 1929–1948

Resources evaluated under this sub-theme are significant in the area of Architecture *as excellent examples of PWA Moderne style and exhibit a high quality of design through distinctive features.* PWA Moderne architecture and its austere, monumental aesthetic was popular during the Great Depression. Funded by the PWA and the National Industrial Recovery Act, it symbolized authority, stability, and continuity at a time when the nation was mired in economic turmoil. It also represented how principles associated with Moderne design were melded together with Classical elements and were adapted and applied to institutional and civic buildings. The style’s austere aesthetic was best suited to civic architecture and banks and financial institutions, but on occasion it was applied to commercial and industrial buildings constructed in the Depression era. Compared with Streamline Moderne, PWA Moderne exhibited more symmetry, with less emphasis on curved exterior forms

Period of Significance: 1929–1948

Period of Significance Justification: The PWA Moderne style was most popular in the 1930s and early 1940s, at which point new construction came to a halt and Americans’ taste in architecture shifted away from the Moderne school and toward purer expressions of Modernism that were simpler and less costly to build. The period of significance begins in 1929, when the style first began appearing in Los Angeles. Though World War II effectively brought an end to the style, a few examples were built in the very early postwar period, with the latest known example in the city dating to 1948.

Geographical Location(s): Civic buildings and other government buildings are located in Downtown, Hollywood, and other administrative centers; other institutional buildings are found citywide, especially in neighborhoods in central Los Angeles that were developed prior to World War II. Commercial examples are generally concentrated in the historic central business district of Downtown.

Area(s) of Significance: Architecture

Criterion: NR: C CR: 3 Local: 3

Associated Property Types:

- Commercial
- Institutional Note: Grouping of resources such as school and hospital campuses may comprise historic districts.

Property Type Description: The PWA Moderne style was generally applied to institutional and civic buildings. Administration buildings, post offices, courthouses, and other federally affiliated institutions often employed the style as it represented a national consensus about how these large-scale civic institutions should look. It was also applied to public school campuses, and receiving stations and distributing stations that were operated by the Los Angeles Department of Water and Power. School campuses and other properties with multiple buildings designed in the style may be evaluated as historic districts. On rare occasions, the style was adapted to a commercial context and was applied to mid- to large-scale commercial offices and telephone exchange plants, though commercial examples of the PWA Moderne style are relatively rare.

Property Type Significance: See Summary Statement of Significance above.

Eligibility Standards:

- Was constructed during the period of significance
- Exhibits quality of design through distinctive features
- Is an excellent example of the PWA Moderne style

Character-Defining /Associative Features:**For Individual Buildings or Contributing Buildings in a historic district**

- Retains most of the essential character-defining features from the period of significance
- Emphasis on verticality
- Flat roofs
- Formal symmetry and massing
- Smooth wall surfaces, such as stucco, marble, terrazzo, polished stone (and brick, although rare.) May also have textured surfaces, such as evidence of form board concrete that would have represented significant savings by eliminating the additional labor-intensive task of applying stucco.
- Pier supports and or fluted pilasters (rather than columns)
- Windows arranged in vertical recessed bays
- Stripped appearance with minimal ornamentation, including some zigzags, medallions, or plaster reliefs
- May have regional influence, exhibiting characteristics of the Spanish Colonial Revival or Mediterranean Revival style

For Historic Districts:

- Must include a majority of buildings which embody the distinctive characteristics of the PWA Moderne style
- Conveys a strong visual sense of overall historic environment from the period of significance

Integrity Considerations:

- Should retain integrity of Location, Design, Materials, Workmanship, and Feeling from the period of significance
- Retains sufficient integrity to convey significance
- Setting may have changed (surrounding buildings and land uses)
- Original use may have changed
- Replacement of some windows and doors may be acceptable if the openings have not been resized and original fenestration patterns have not been disrupted

For Historic Districts:

- District as a whole should retain sufficient integrity to convey significance
- District should retain integrity of setting, particularly when associated with designed landscapes
- May include some buildings dating from outside the period of significance

SECTION 5.0

HISTORIC RESOURCES ASSESSMENT

5.1 PREVIOUS INVESTIGATIONS

Three key LAUSD documents with information pertinent to the proposed Irving MS Project were referenced for this HRTR: the 2014 *Los Angeles Unified School District Historic Resources Survey Report* (HRSR),³⁹ 2014 LAUSD HCS, and the 2022 HRER. Document scopes and primary findings are described below.

Historic Resources Survey Report

The HRSR provides a foundation for identification, documentation, and maintenance of LAUSD's historically significant school buildings and campuses, in support of the District's management and planning activities. At the time of the district-wide historic resources survey, 55 LAUSD campuses were 45 years of age or older. The HRSR includes a table of an updated LAUSD Historic Resources Inventory and the compiled results from the LAUSD Historic Resources Survey, 2013–2014, and the Getty Resources Surveys, 2001–2004. Irving MS was evaluated as 3S - Appears eligible for National Register as an individual property through SurveyLA or other survey evaluation.

Historic Context Statement, 1870 to 1969

In conjunction with the HRSR, the HCS outlines historic contexts and themes of significance, along with relevant eligibility standards, character-defining features, and integrity considerations for each.⁴⁰ Irving MS appears to meet the thresholds of potential eligibility.

Historic Resources Evaluation Report

The HRER confirmed the eligibility of Irving MS for listing with NRHP, CRHR, and Los Angeles HCM, recommending that the Washington Irving Middle School Historic District (WIMSHD) is eligible under Criteria A/1/a and C/3/c and d, with a status code of 3D (eligible through survey evaluation). None of the buildings was deemed individually eligible for listing. Under the guidelines of the HCS, the HRER identified WIMSHD as historically significant and recommended the historic district as a historical resource in accordance with CEQA and a historic property in accordance with NHPA:

Criterion A/1/a. The six 1930s buildings on the middle school campus form a historic core that meets all three eligibility standards under the theme of LAUSD, Post-1933 Long Beach Earthquake School Plants. The WIMSHD exemplifies school planning, design, and earthquake-resistant construction under the theme of LAUSD, Post-1933 Long Beach Earthquake School Plants.

Criterion B/2. WIMSHD was recommended as *not eligible* for listing under this criterion.

³⁹ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Resources Survey Report. Prepared for the LAUSD Office of Environmental Health and Safety.

⁴⁰ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for the LAUSD Office of Environmental Health and Safety.

Criterion C/3/c. Irving MS was described as an excellent intact example of PWA Moderne architecture applied to a middle school campus, and an important example of the work of Los Angeles architect Edwin L. Bergstrom (HRG 2017).

Criterion D/4. WIMSHD was recommended as *not eligible* for listing under this criterion, as this common property type does not have the potential to provide information.

As indicated in the HRER,

The four major original campus buildings exhibit most of the character-defining features listed in the *LAUSD Historic Context Statement*, with the exception of classroom wings designed for easy access to outdoors and an emphasis on “traditional Southern Californian” styles. As described in the context statement, the PWA Moderne style is more streamlined and less ornamental than 1920s period-revival styles. The Irving MS buildings were partially or fully funded through WPA, which was extant from 1935 through 1943. Three of the six potential contributors to the historic district, the most distinguished of the six, were designed by master architect Edwin Bergstrom, a prominent urban designer and prolific architect of the period.⁴¹

Bergstrom’s prestigious designs include the Pasadena Civic Auditorium and, as codesigner, the Pentagon Building. Bergstrom also founded the distinguished Allied Architects Association in 1921. For Irving MS, he worked with District Architect Alfred S. Nibecker Jr., who contributed the design of the Cafeteria and Shop No. 1 and Shop No. 2, closely following the design established by Bergstrom for the Cafeteria. The recommended contributors exemplify Post–1933 Long Beach Earthquake buildings; however, they are not individually outstanding examples of the theme under Criterion A/1. Research revealed no evidence that any important person was directly associated with any individual building. Therefore, none of the contributors is recommended individually eligible under Criterion B/2. Under Criterion C/3, four of the contributors exhibit the character-defining features of a PWA Moderne building. However, none rises to the level of individual significance. None of the contributors is recommended individually eligible under Criterion D/4 because they do not have the potential to provide information about history that cannot be found through historic research. In summary, none of the Irving MS buildings are recommended individually eligible for the NRHP/CRHR under any criteria.⁴²

Built Environment Resource Directory

The Built Environment Resources Directory (BERD) files provide information, organized by county, regarding non-archaeological resources in the Office of Historic Preservation’s (OHP) inventory. The OHP inventory contains information only for cultural resources that have been processed through the office. This includes resources reviewed for eligibility to the NRHP and the California Historical Landmarks programs.

BERD’s status code for the campus is 7N, meaning the property “needs to be reevaluated – formerly coded as may become eligible with specific conditions.” No date of the BERD evaluation was included in the record.

⁴² ASM Affiliates, Inc. 2022. Historic Resource Evaluation Report: Irving Middle School. Prepared for Los Angeles Unified School District, Office of Environmental Health & Safety. P. 77.

SURVEYLA

SurveyLA's evaluation for Irving MS is presented in "Historic Places LA, Los Angeles Historic Resources Inventory."⁴³ Evaluated on April 27, 2012, it determined that the campus was eligible for its embodiment "of LAUSD school planning and design concepts of the period" and also eligible as an "excellent intact example of the PWA Moderne architecture applied to a middle school campus and an important example of the work of Los Angeles architect Edwin George Bergstrom." It is listed as an "Institutional District" under Historic District Type.

SurveyLA assigned the district the following status codes:

- 3S – Appears eligible for National Register as an individual property through SurveyLA or other survey evaluation.
- 3CS – Appears eligible for California Register as an individual property through SurveyLA or other survey evaluation.
- 5S3 – Appears to be individually eligible for local listing or designation through SurveyLA or other survey evaluation.

HISTORIC CONTEXTS AND THEMES RELATED TO IRVING MS ELIGIBILITY

The Irving MS Campus buildings could be considered potentially eligible under the HCS because they meet Criterion (a) standards, as a reflection of broad cultural and economic history.^{44,45} The Campus was partially funded federally by the PWA. Additionally, the Campus exhibits design features and construction techniques used in accordance with new regulations developed by the State of California and the City of Los Angeles following the aftermath of the 1933 Long Beach Earthquake.⁴⁶ As the buildings show distinguishing characteristics of an architectural style and construction from a particular period, Criterion (c) is another potential eligibility criteria.⁴⁷ As architect Edwin L. Bergstrom influenced Los Angeles architecture, there is also potential eligibility under Criterion (d).^{48,49,50}

State of California Historical Resources Inventory

The Historical Resources Inventory (HRI) maintained by the OHP includes only information on historic resources that have been identified and evaluated through one of the programs that OHP administers under the NHPA or the PRC. The HRI includes data on the following:

- Resources evaluated in local government historic resource surveys partially funded through Certified Local Government grants or in surveys that local governments have submitted for inclusion in the statewide inventory
- Resources evaluated and determinations of eligibility (DOEs) made in compliance with Section 106 of the NHPA
- Resources evaluated for federal tax credit certifications
- Resources considered for listing in the NRHP and CRHR or as California State Landmarks or Points of Historical Interest⁵¹

5.2 RESULTS OF THE FIELD SURVEY

There are 11 permanent and 6 portable buildings on the Irving MS campus. Six buildings comprise the historic core (Figure 1-2). The remaining five permanent buildings and six portable structures were constructed later and were determined to be insignificant. No further investigations of these five later permanent buildings were conducted. Six buildings, all at least 50 years old, were identified in the HRER for further study and recordation on California Historical Resources Inventory forms (HRER Appendix A, *California Department of Parks and Recreation Forms*).⁵² These same six buildings were determined to *not meet* the criteria of significance required for listing as *individual* resources in the NRHP, CRHR, or the Los Angeles Register of Historic Landmarks. The six buildings appear to meet the criteria for listing in the CRHR as contributors to a historic district and appear to have retained sufficient integrity for inclusion in the NRHP. The results of the December 18, 2023, field survey by architectural historian Graham Larkin are presented in Table 5-1, *Field Survey Results*.

**TABLE 5-1
FIELD SURVEY RESULTS FOR IRVING MS CAMPUS**

Building	Year of Design / Construction	Architect	Eligibility Criterion (NRHP/CRHR)	CRHR Code
Administration	1936/1937	Bergstrom	A/1 and C/3	3D
Auditorium	1939	Bergstrom	A/1 and C/3	3D
Physical Education	1936/1937	Bergstrom	A/1 and C/3	3D
Cafeteria	1937	Nibecker	A/1 and C/3	3D
Shop No. 1	1937	Nibecker	A/1	3D
Shop No. 2	1937	Nibecker	A/1	3D

All six of these buildings are contributors to a historical resource, and none is individually eligible. All have been assigned a CA SHPO status of 3D.

Setting

The setting is demonstrative of LAUSD’s approach to urban campuses during the period of significance. Walkways straight and curved, lined with concrete curbs painted a bright blue, meander through expanses of grass lawn dotted with mature trees of various species including many *Washingtonia filifera* (native palm trees). Please see Figure 5-1, *Site Photographs*, for photographs of the buildings described below that were taken during a site walk on July 5, 2023, and the December 18, 2023 field survey.

Administration Building

(see Photos 1–3 in Figure 5-1)

The imposing Administration Building was built in 1936–1937 and designed by architect Edwin L. Bergstrom. It is a flat-roofed concrete building in three rectangular sections, with a slightly wider central section, with a total footprint of 64 feet by 391 feet. The building is two stories high, with a partial ground-level basement at the northeast end. Facing the parking lot, the northwest elevation is entered by two doors flanking the central section and topped by multi-light stairwells. The campus-facing southeast door, in the middle of the central section, is approached by steps and flanked by full-height fluted pilasters culminating in a textured parapet set back from the roofline. There is another entrance on the southwest end, which is topped by a dramatic glass block wall between wide pilasters with a central medallion just below the roofline. This configuration is repeated, without a door, on the northeast end.

The majority of the windows are the same throughout both levels, consisting of recessed wood two-by-two over two-by-two sash set in channels between horizontal dentil molding at the top and a simple continuous stringcourse below. The windows are evenly spaced in groups of four, separated by wide-fluted sections. Bold medallions punctuate the cornice level. The concrete surfaces are enlivened by the narrow, vertical form board patterns throughout all facades.

The building contains such typical PWA Moderne features as bold massing, extensive sash fenestration, grooved horizontal awnings over the entrances, and horizontal board-form textures typical of cost-efficient Depression-era public projects. Other notable features, well-integrated and consistent with the PWA Moderne style, include horizontal plaster ornamentation, including dentils and striated stringcourses; multistory expanses of glass blocks on the southwest and northeast elevations; glass blocks flanking the ground floor entrances; concrete grilles covering secondary windows; multi-light transoms throughout the interior; and curved corners in hallways.

The interior of the Administration Building consists of a double-loaded central corridor at each floor, running the entire length of the building. The expanse of glass blocks extending from the ground level across both floors pass through the second-level floor plane, providing natural light at both ends of the corridors on both levels. The glass blocks flanking the entry at the center of the northwest elevation allow light into the interior of the ground floor at the bottom of a stairwell. The corridors have dropped ceilings of acoustical tile with inset fluorescent lighting and vinyl tile flooring. The doors are metal, each with a single vertically oriented light, and lever-type hardware. Some doors have multi-light transoms that have been painted over. Corners in the corridors are rounded. A few original wood display cases with decorative molding and glass insets remain on the first floor. In the classrooms and offices, the ceilings have acoustical tile with attached rectangular fluorescent lighting. In the interior, windows and doors have wood molding surrounds. A few original paneled wood doors with brass hardware remain in the offices.

Auditorium

(see Photos 4–6 in Figure 5-1)

Located near the northeast end of the Administration Building, the Auditorium, constructed in 1939 and designed by Edwin L. Bergstrom, is rectangular in massing. The northwest (primary) elevation faces the Administration Building, to which it is connected by way of a broad concrete pedestrian walkway. The Auditorium is in the same PWA Moderne style, except windowless, with most of the wall surface consisting of concrete articulated by horizontal board-form texturing. Four bold, wide-fluted pilasters extend for most of the height of the primary elevation. The pilasters support an articulated stringcourse topped by a bare cornice. At the center there are three low entrance doorways, set between bold rectangle and surmounted by the word “Auditorium” in cutout bronze majuscule. On the outer edges of the primary elevation, at door level, there is a bold, concrete grille of chevron, triangle, and rectangular cutouts about 5 inches deep and flush with the surface. Behind the grilles are plaster bas reliefs that may be original to the Auditorium.

On either side of the center set of double doors are two primary character-defining features. One is the dedication plaque stating “Federal Emergency Administration of Public Works” along with Franklin D. Roosevelt, President of the United States; and Harold Ickes, the influential PWA administrator. The date, 1939, is prominently displayed. On the other side of the door, the Auditorium has been renamed the Helen Watson Pierce Auditorium, dedicated June 12, 1942.

The northeast and southwest elevations are nearly identical, higher in the center to accommodate the high ceiling of the assembly hall. The hall is lit by three multi-light windows, separated on the exterior by bold, fluted pilasters. These are similar to the pilasters found on the Administration Building, but here without fluting. The Auditorium is wrapped in a stringcourse identical to the one on the Administration Building. The southeast wall, behind the stage, is plain except for pairs of wide, fluted vertical bands and a protruding cornice. On this rear end of the building, the lawn slopes down to reveal windows and service doors.

The interior is especially evocative of the period of significance. The full-width foyer features a huge terrazzo mural on the wall facing the entrance. Like the buildings, the mural was a project of the Federal Emergency Works Progress Administration, 1939, under President Roosevelt. Throughout the interior, gentle curves were introduced, for example, at corners, the ticket windows, the lobby ceiling motif, and the walls flanking the proscenium. The foyer also features four handsome circular aluminum chandeliers, also contributing to its feeling and association with PWA Moderne. The Auditorium has round aluminum chandeliers as well, slightly different from those in the foyer. The seating, with striated cast-iron side supports and molded plywood foldable seats, have been retained and appear to be in good condition. The band room is located behind the Auditorium. Additional details in the Auditorium that have been retained include original wood panel doors, frames, and hardware and a curved wood staircase with articulated handrails (a detail that also continues along the edge of the stage, visually linking the two staircases using this continuous banding). The ceiling near the stage features a soffit composed of a sequence of plaster steps for mechanical systems.

Cafeteria

(see Photo 7 in Figure 5-1)

The single-story Cafeteria is centered on the Administration Building to the northwest and generally matches that building's design strategies even though it is not designed by master architect Edwin L. Bergstrom. It is the work of School District Architect Alfred S. Nibecker Jr., and was constructed in 1937. The setting consists of paved parking areas, patios, and mature trees. A driveway that was once Rosswell Street runs parallel to the northwest elevation of the building. Similar to the other major buildings in the campus core, the building has a flat parapet capped with metal coping and a prominent stringcourse with horizontal bands a few feet below. This building is clad in smooth stucco. It echoes the design elements of the other original buildings in its use of fluted pilasters between groups of windows. It has a generally rectangular plan, with a small wing extending from the southeast elevation and an entry vestibule extending from the southwest elevation. Both of these wings have overhanging flat roofs and fascia with horizontal bands. This motif is carried through in a projecting element running across the tops of windows and doors. Cut-out bronze letters identifying the building are attached to the northwest elevation. Overflow scuppers are located above square catchment boxes (labeled "Catchment Heads" on architectural drawings), with horizontal bands capping round downspouts. Small round vents are located below the stringcourse. Vertically oriented multi-light windows paired in groups of two or three with fluted divisions that are partially operable. Notably, the interior retains some features rarely surviving in buildings of any type, including a Moderne-style water station ornamented by curved aluminum strips.

Physical Education Building

(see Photo 8 in Figure 5-1)

The two-story Physical Education Building is located southwest of the Administration Building, just northeast of the playing field. Constructed in 1937 and designed by Edwin L. Bergstrom, as noted in the HRER, the building repeats the design elements of the Administration Building, such as vertical bands of fluted pilasters, the dentil string course wrapping the building, and a flat roof line bordered by blue coping. Like its siblings, it is characterized by wide expanses of textured board-formed cast concrete. By contrast to the other two buildings, however, here the multi-light window groupings are located high on the tall second-story walls (as would be typical of spaces devoted to basketball and other sports, where the lower parts of the walls are used for stadium seating for watching the games). The shorter ground story has fewer and smaller windows. These smaller windows denote offices and locker, dressing, and storage areas. Stairwells feature vertically oriented window arrangements, clearly denoting their function on the exterior. Like its peers, curved corners bordered by curving handrails and lower steps are character-defining features of the PWA Moderne style. The gym features a high-quality maple parquet floor.

Shop No. 1 and Shop No. 2

(see Photo 9 in Figure 5-1)

These two, one-story shops, constructed in 1937 and designed by Nibecker, are very similar in footprint, flat parapet rooflines with metal coping, and rectangular massing. Located southwest of the Cafeteria and perpendicular to the Physical Education Building, these appear as plain beige stucco boxes. The southeast elevations include windows of six-by-five light operable windows; other elevations have irregularly spaced windows (all covered with metal security mesh), and single and double metal doors. Unadorned with the type of decorative features present in the other four major contributing buildings; nonetheless, they are integral to the original campus layout and its spatial relationships.

6.1 THRESHOLDS OF SIGNIFICANCE

Under CEQA, a project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment. Substantial adverse change in the significance of a historic resource is defined as physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings that materially impairs, in an adverse manner, the significance of a historic resource, such that its physical characteristics no longer convey its historical significance and no longer justify its inclusion in, or eligibility for inclusion in, the CRHR, a local register of historic resources pursuant to Section 5020.1(k) of the PRC, or historic resources survey, meeting the requirements of Section 5024.1(g) of the PRC.⁵³ In general, a project that follows the *Secretary of the Interior's Standards for the Treatment of Historic Properties*⁵⁴ and associated guidelines shall be considered as mitigated to below the level of significance.⁵⁵

A portion of the campus is eligible as a historic district under the NRHP and CRHR Criteria A/1 and C/3, as a City of Los Angeles HCM under Criteria 1 and 3, and as a historical resource pursuant to CEQA. Applicable historic contexts and themes, eligibility standards, character-defining features, and integrity considerations for individual significance and significance as a historic district are provided in the HCS.⁵⁶ The following are applicable to Irving MS, as specified in the HRER:

CONTEXT: Public and Private Institutional Development/Education⁵⁷

THEME: LAUSD/Post-1933 Long Beach Earthquake School Plants

Property Type: Institutional/Educational
Property Subtypes: Elementary, Junior High, and High School Buildings and Campuses
Period of Significance: 1933 to 1945
Area of Significance: Education
Geographic Location: Citywide
Area of Significance: A/1/a

⁵³ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for the LAUSD Office of Environmental Health and Safety. Pp. 141–43.

⁵⁴ National Park Service. 1992. The Secretary of the Interior's Standards for the Treatment of Historic Properties. <http://www.cr.nps.gov/hps/tps/standguide/>.

⁵⁵ California Code of Regulations, Title 14, Chapter, CEQA Guidelines. Section 15064.5(b).

⁵⁶ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for the LAUSD Office of Environmental Health and Safety. Page 124.

⁵⁷ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for the LAUSD Office of Environmental Health and Safety. Pp. 137–38.

Below are the eligibility criteria and character-defining features that are *present* at Irving MS and *most relevant* to the historic district's significance and retention of integrity:

Eligibility Standards

- Exemplifies post–Long Beach earthquake school planning and design concepts of the period, including requirements under the 1934 Field Act
- Up to two stories in massing for middle/junior/high schools⁵⁸
- Retains most of the associative and character-defining features from the period of significance, 1936–1939

Character-Defining Features Buildings/Structures

- Up to two stories for middle and senior high schools
- Reinforced concrete, steel-, or wood-frame construction
- Generous expanses of windows, including steel- and wood-framed multi-light windows, awning and hopper casements, clerestories, and large-pane fixed windows; window groupings often mark the location of classrooms
- Stylistically more streamlined and less ornamental than 1920s period-revival styles
- Styles may include PWA Streamline Moderne, Art Deco, Late Moderne, and proto-modern styles
- May have been partially or fully funded through WPA, 1935–1943
- WPA projects may include significant interior artwork such as murals, paintings, and sculpture
- May have been designed by a prominent architect of the period

Campus/District

- Unified site plan consisting of buildings and structures designed and sited according to their use
- Use of designed outdoor and landscaped spaces, for outdoor study, recreation and dining
- Emphasis on a more expansive site plan
- Varied collection of buildings, differentiated by function and use (rather than a single building with all functions inside)
- Might include an elaborate administration building, located near the campus entrance; administration buildings usually serve as the focal point of campus.
- Campus often composed of groupings of classroom wings, auditoriums, gymnasiums, cafeterias, and outdoor recreation and dining areas
- Middle or senior high schools might include a gymnasium designed in the style of the campus overall

Integrity Considerations

- Should retain most of the essential physical features from the period of significance
- Modern lighting and fencing of site acceptable
- Schools from this period generally include buildings constructed after the period of significance, in particular post–World War II buildings, which may be noncontributing
- Eligible properties under this theme may be a single building, if it exemplifies the design ideals of the era, or a grouping (campus) of buildings constructed during the period of significance

⁵⁸ Sapphos Environmental, Inc. 2014. Los Angeles Unified School District Historic Context Statement, 1870 to 1969. Prepared for the LAUSD Office of Environmental Health and Safety. P. 137.

- Intact campus groupings from the pre-1945 era are not common
- Should retain integrity of materials, design, workmanship, feeling, and association from its period of significance

ARCHITECTURAL STYLE: PWA Moderne

AREA OF SIGNIFICANCE: C/3

Eligibility Standards:

- Was constructed during the period of significance
- Exhibits quality of design through distinctive features
- Is an excellent example of the PWA Moderne style

Character-Defining /Associative Features:

For Individual Buildings or Contributing Buildings in a Historic District

- Retains most of the essential character-defining features from the period of significance
- Emphasis on verticality
- Flat roofs
- Formal symmetry and massing
- Smooth wall surfaces, such as stucco, marble, terrazzo, polished stone (and brick, although rare.) May also have textured surfaces, such as evidence of form board concrete that would have represented significant savings by eliminating the additional labor-intensive task of applying stucco.
- Pier supports and or fluted pilasters (rather than columns)
- Windows arranged in vertical recessed bays
- Stripped appearance with minimal ornamentation, including some zigzags, medallions, or plaster reliefs
- May have regional influence, exhibiting characteristics of the Spanish Colonial Revival or Mediterranean Revival style

For Historic Districts:

- Must include a majority of buildings which embody the distinctive characteristics of the PWA Moderne style
- Conveys a strong visual sense of overall historic environment from the period of significance

Integrity Considerations:

- Should retain integrity of location, design, materials, workmanship, and feeling from the period of significance
- Retains sufficient integrity to convey significance
- Setting may have changed (surrounding buildings and land uses)
- Original use may have changed
- Replacement of some windows and doors may be acceptable if the openings have not been resized and original fenestration patterns have not been disrupted

For Historic Districts:

- District as a whole should retain sufficient integrity to convey significance
- District should retain integrity of setting, particularly when associated with designed landscapes
- May include some buildings dating from outside the period of significance

Based on above thresholds, all of which the campus meets, the Irving MS is eligible as a historic district.

6.2 IMPACTS TO HISTORIC RESOURCES

The proposed Project includes the demolition of the Administration Building, a PWA Moderne building at the center of the 1930s campus. It is approximately 35 feet away from the Auditorium, approximately 45 feet away from the Physical Education Building, and approximately 50 feet away from the Cafeteria, and it is stylistically integrated with all three of those buildings.

Demolition of the Administration Building would result in a less than significant impact on the historic district. Even absent the Administration Building, the three proximate and primary district contributors (Auditorium, Physical Education Building, Cafeteria) would retain sufficient integrity, both as individual buildings and as stylistically unified contributors to the historic district.

The other two historic resources on the campus—namely, the two shops—are at a considerably greater distance (some 125 feet and 180 feet, respectively). The intervening sightlines are disrupted by other buildings, and their relative plainness renders them stylistically distinct from the Administration Building. They would still serve as historic district contributors, part of a “varied collection of buildings, differentiated by function and use” as indicated in the eligibility criteria discussed above. Demolition, or partial demolition, of the Administration Building would not result in a significant indirect impact on the two historic shop buildings.

While the demolition of the Administration Building would compromise the integrity of the district, the other five buildings in the eligible district would fully retain their integrity and their repertoire of character-defining features, permitting the district to continue to convey its historic significance. They would continue to retain aspects of location, design, materials, workmanship, feeling, and association, while the setting would be compromised with the loss of the central hub of the campus. The five buildings would continue to function as key elements of a historic campus; as noted in the HCS under “Integrity Considerations,” “intact campus groupings from the pre-1945 era are not common,” thus providing an additional basis for maintaining the other contributing buildings in their original locations so that the district retains its status as a historic district.

6.3 MITIGATION MEASURES

A lead agency is required by CEQA to undertake all feasible mitigation measures that could avoid or minimize significant adverse impacts to the environment. If mitigation measures do not reduce significant impacts to below a level of significance, all feasible mitigation shall still be undertaken. According to PRC Section 21061.1, “feasible” is defined as being capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological measures. As discussed throughout this report, the impact of the proposed Project on historic resources would be less than significant, pursuant to the State CEQA Guidelines. Therefore, no mitigation measures are required.

Implementation of standard conditions SC-CUL-1 through SC-CUL-11 would be required under the proposed Project. For example, consistent with SC-CUL-4, prior to the initiation of any project-related demolition or construction work on a historic building, LAUSD shall ensure the preparation of Historic American Buildings Survey (HABS)-like documentation, in accordance with applicable standards described in the Secretary of the Interior's Standards for Architectural and Engineering Documentation, and as required by the LAUSD Standard Conditions in section 2.4 above.

Alternatives

If the Administration Building were to be retained and rehabilitated for seismic reinforcement, such an action would be an acceptable alternative that would be considered as mitigated to a level of less than a significant impact to a historic resource, per PRC Sections 1506.5(3) and 15331. A historical architect or architectural historian who meets the Secretary of the Interior's minimum qualifications for those classifications would be required to participate in the proposed Project.

Project Design Features

The project design features included in this HRTR reference 1976 *Secretary of the Interior's Standards for Historic Preservation Projects with Guidelines for Applying the Standards*,⁶⁰ 1995 *Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings*,⁶¹ and the 1997 *National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation*.⁶² Guidelines set forth as SC-CUL-2 (see Section 2.4 of this HRTR) support LAUSD policies and goals, as developed in the following reports:

- Los Angeles Unified School District. August 2023. School Design Guide.

The School Design Guide has guidelines for the treatment of historic resources, under Section 3.1. D., Historic Preservation, p. 125:

- a. Retain and preserve the historic character of a building, structure or site.
- b. Distinctive architectural features or examples of skilled craftsmanship that characterize a building be treated with sensitivity.
- c. Reinforcement required for structural stability or the installation of life safety or mechanical systems shall be concealed.
- d. Surface cleaning of historic structures shall be undertaken with the gentlest means possible. Avoid sandblasting and chemical treatments.

Design guidelines and treatment approaches for historic schools can be found at:

- SWCA Environmental Services. 2015. LAUSD Design Guidelines and Treatment Approaches for Historic Schools. Prepared for Los Angeles Unified School District.

⁶⁰ National Park Service. 1976. Secretary of the Interior's Standards for Historic Preservation Projects with Guidelines for Applying the Standards.

⁶¹ National Park Service. 1995. Secretary of the Interior's Standards for the Treatment of Historic Properties with Guidelines for Preserving, Rehabilitating, Restoring and Reconstructing Historic Buildings.

⁶² National Park Service. 1997. National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation.

These guidelines and approaches include:

- Upgrade, modernization and new construction projects for schools identified as historic resources for the purposes of CEQA will conform with the SOI Standards to the maximum extent practicable;
- Master planning initiatives for schools identified as historic resources under CEQA shall be subject to environmental review and evaluation by a qualified historic preservation professional to ensure that potential negative impacts to historic resources are avoided through conformance with the SOI Standards and LAUSD cultural resource policies and procedures;
- Some modernization projects might include elements that do not conform with the SOI Standards, but the project overall might not result in significant adverse impacts to historic resources and might therefore be acceptable; such cases must be studied on a case-by-case basis;
- In cases where modernization of LAUSD's significant historic resources cannot be feasibly undertaken in conformance with the SOI Standards and significant adverse effects to historic resources result, the district shall, through the environmental review process, in conjunction with a qualified historic preservation professional, develop and implement mitigation measures to reduce adverse impacts. Mitigation monitoring will include consultation with a qualified historic preservation professional.

According to 36 CFR Part 68 of the Secretary of the Interior's Standards for the Treatment of Historic Properties, "one set of standards ... will apply to a property undergoing treatment, depending upon the property's significance, existing physical condition, the extent of documentation available, and interpretive goals, when applicable. The Standards will be applied taking into consideration the economic and technical feasibility of each project." There are four treatment approaches, each with its own set of standards.

1. "Preservation" acknowledges a resource as a document of its history over time and emphasizes stabilization, maintenance, and repair of existing historic fabric.
2. "Rehabilitation," while also incorporating the retention of features that convey historic character, accommodates alterations and additions to facilitate continuing or new uses.
3. "Restoration" involves the retention and replacement of features from a specific period of significance.
4. "Reconstruction" is the act or process of depicting, by means of new construction, the form, features, and detailing of a nonsurviving site, landscape, building, structure, or object for the purpose of replicating its appearance at a specific period of time and in its historic location.

Project Design Feature PDF-Cultural-1

LAUSD shall document the historic character of the Administration Building, Washington Irving Middle School, 3010 Estara Street, Los Angeles, including its history and architecture both exterior and interior, from the founding of the City (1781, incorporated 1850) until 1939, when the contributing buildings were completed, through a permanent, on-campus educational and interpretative exhibit. This exhibit shall be accessible to the general public for a period of at least one year, and shall include both text and historical images. The history and architecture of all contributing buildings, including the Auditorium, the Cafeteria, the Physical Education Building, and Shop No. 1 and Shop No. 2, shall be included in the exhibit, and in any accompanying

brochure or webpage. A historical architect, historian, or architectural historian who meets the Secretary of the Interior's professional qualifications shall be engaged to research and write the exhibit, brochure, or webpage. The exhibit, brochure, or webpage shall be initiated within 6 months of the approval of the proposed Project and shall be completed within a period of no more than 2 years. The Administration Building should be outlined with flush pavers (perhaps remnants of the board-form concrete so characteristic of the era in LAUSD history), with landscape, water features that employ sustainable methods for water conservation, or other creative strategies that clearly indicate the original footprint.

6.4 LEVEL OF SIGNIFICANCE AFTER MITIGATION

The impact of the proposed Project on historic resources would be less than significant. Therefore, no mitigation measures are required.

6.5 CONCLUSION

This HRTR affirms the findings in the HRER that a portion of the campus is eligible under the NRHP and CRHR Criteria A/1 and C/3, as a City of Los Angeles HCM under Criteria 1 and 3 and, therefore, is a historical resource pursuant to CEQA. This HRTR addresses an 11.2-acre study area located at 3010 Estara Avenue, City of Los Angeles, Los Angeles County, California, within the USGS Los Angeles topographic quadrangle. This evaluation was prepared to determine the historical resource/historic property status of original buildings on the Irving MS Campus, both individually as buildings over 45 years of age, and as potential contributors to a historic district to facilitate LAUSD compliance with CEQA.

The analysis indicates that six buildings on the Irving MS campus are eligible for historic designation as City of Los Angeles landmarks, as contributors to the Irving MS Campus historic district. The proposed Project includes the demolition of the Administration Building, an action that would weaken but not invalidate the eligibility of the Campus as a historic district. Demolition of the Administration Building would result in a less than significant impact to the historic district. The five remaining historic buildings would remain in place and continue to convey the historic significance of the district.

In accordance with the HCS, the historic portion of the school campus currently retains all the essential physical features from the period of significance, 1936–1939, and the Washington Irving Middle School Historic District continues to be eligible as a historical resource.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	LAUSD Irving MS
Construction Start Date	12/1/2026
Operational Year	2030
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	0.50
Precipitation (days)	8.60
Location	34.11653252835012, -118.24117248396762
County	Los Angeles-South Coast
City	Los Angeles
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	3970
EDFZ	16
Electric Utility	Los Angeles Department of Water & Power
Gas Utility	Southern California Gas
App Version	2022.1.1.25

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
------------------	------	------	-------------	-----------------------	------------------------	--------------------------------	------------	-------------

Junior High School	60.0	1000sqft	1.38	60,000	1.00	2.00	—	—
Other Asphalt Surfaces	0.30	Acre	0.30	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-1-B	Use Cleaner-Fuel Equipment
Construction	C-2*	Limit Heavy-Duty Diesel Vehicle Idling
Construction	C-3	Use Local Construction Contractors
Construction	C-4*	Use Local and Sustainable Building Materials
Construction	C-9	Use Dust Suppressants
Transportation	T-30*	Use Cleaner-Fuel Vehicles
Energy	E-2	Require Energy Efficient Appliances
Water	W-5	Design Water-Efficient Landscapes
Waste	S-4*	Recycle Demolished Construction Material
Refrigerants	R-7*	Reduce Disposal Emissions

* Qualitative or supporting measure. Emission reductions not included in the mitigated emissions results.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Architectural Coating	Vendor	—	10.2	HHDT,MHDT
Architectural Coating	Hauling	0.00	20.0	HHDT
Architectural Coating	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Control Strategies Applied	PM10 Reduction	PM2.5 Reduction
Water unpaved roads twice daily	55%	55%
Limit vehicle speeds on unpaved roads to 25 mph	44%	44%
Sweep paved roads once per month	9%	9%

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	90,000	30,000	784

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (Building Square Footage)	Acres Paved (acres)
Demolition	0.00	0.00	0.00	60,000	—
Site Preparation	—	—	0.00	0.00	—
Paving	0.00	0.00	0.00	0.00	0.30

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	2	61%	61%
Water Demolished Area	2	36%	36%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Junior High School	0.00	0%
Other Asphalt Surfaces	0.30	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2026	0.00	690	0.05	0.01
2027	0.00	690	0.05	0.01
2028	0.00	690	0.05	0.01
2029	0.00	690	0.05	0.01

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Total all Land Uses	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

5.9.2. Mitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Total all Land Uses	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.1.2. Mitigated

5.10.2. Architectural Coatings

Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
0	0.00	90,000	30,000	784

5.10.3. Landscape Equipment

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	250

5.10.4. Landscape Equipment - Mitigated

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	250

5.11. Operational Energy Consumption

5.11.1. Unmitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	12.3	annual days of extreme heat

Extreme Precipitation	6.65	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	65.4
AQ-PM	77.4
AQ-DPM	87.5
Drinking Water	59.7
Lead Risk Housing	83.5
Pesticides	0.00
Toxic Releases	73.4
Traffic	90.3

Effect Indicators	—
CleanUp Sites	92.0
Groundwater	93.2
Haz Waste Facilities/Generators	87.6
Impaired Water Bodies	58.7
Solid Waste	52.9
Sensitive Population	—
Asthma	74.8
Cardio-vascular	38.5
Low Birth Weights	71.8
Socioeconomic Factor Indicators	—
Education	86.1
Housing	86.3
Linguistic	94.3
Poverty	88.3
Unemployment	55.0

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	17.52855126
Employed	43.98819453
Median HI	8.892595919
Education	—
Bachelor's or higher	30.4889003
High school enrollment	100

Preschool enrollment	53.13743103
Transportation	—
Auto Access	5.915565251
Active commuting	90.14500192
Social	—
2-parent households	45.70768639
Voting	35.54471962

Park access	81.35506224
Retail density	69.69074811
Supermarket access	26.80610805
Tree canopy	57.71846529
Housing	—
Homeownership	3.503143847
Housing habitability	2.669061979
Low-inc homeowner severe housing cost burden	2.579237777
Low-inc renter severe housing cost burden	39.49698447
Uncrowded housing	5.966893366
Health Outcomes	—
Insured adults	12.30591557
Arthritis	56.7
Asthma ER Admissions	21.7
High Blood Pressure	54.9
Cancer (excluding skin)	82.6
Asthma	30.0
Coronary Heart Disease	28.5

Chronic Obstructive Pulmonary Disease	29.1
Diagnosed Diabetes	10.7
Life Expectancy at Birth	79.1
Cognitively Disabled	25.4
Physically Disabled	19.5
Heart Attack ER Admissions	52.8
Mental Health Not Good	13.8
Chronic Kidney Disease	20.1
Obesity	19.9
Pedestrian Injuries	56.4
Physical Health Not Good	9.4
Stroke	22.5
Health Risk Behaviors	—
Binge Drinking	83.4
Current Smoker	20.8
No Leisure Time for Physical Activity	9.5
Climate Change Exposures	—
Wildfire Risk	0.2
SLR Inundation Area	0.0
Children	59.5
Elderly	70.8
English Speaking	5.4
Foreign-born	95.0
Outdoor Workers	26.5
Climate Change Adaptive Capacity	—
Impervious Surface Cover	10.1
Traffic Density	90.7

Traffic Access	69.6
Other Indices	—
Hardship	88.4
Other Decision Support	—
2016 Voting	25.3

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	98.0
Healthy Places Index Score for Project Location (b)	21.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	Yes
Project Located in a Low-Income Community (Assembly Bill 1550)	Yes
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
--------	---------------

Land Use	Assuming approximately 1.4 acres for education classroom buildings and includes estimated landscaping area to be improved. Parking - 45 spots (300 square-feet per spot) to be removed and replace with 35.
Construction: Construction Phases	Changes based on updated CS schedule and duration.
Construction: Off-Road Equipment	Numbers based on revised CS.
Construction: Dust From Material Movement	Site preparation activities are anticipated to be minimal, including landscaping updates.
Construction: Trips and VMT	Estimated values.

APPENDIX 7

Noise Background and Modeling Data

Appendix 7 provides supporting information to the Noise section of the Draft EIR and contains the following sections: definitions, sound characteristics, regulatory framework, noise monitoring data from the site visit conducted on August 22, 2023, and Roadway Construction Noise Modelling results.

7.1 WORKING DEFINITIONS

Sound. A vibratory disturbance that, when transmitted by pressure waves through a medium such as air, is capable of being detected by a receiving mechanism, such as the human ear or a microphone.

Noise. Sound that is loud, unpleasant, unexpected, or otherwise undesirable.

Decibel (dB). A unitless measure of sound on a logarithmic scale, which indicates the squared ratio of sound pressure amplitude to a reference sound pressure amplitude. The reference pressure is 20 micropascals (20 μ Pa).

Vibration Decibel (VdB). A unitless measure of vibration, expressed on a logarithmic scale and with respect to a defined reference vibration velocity. In the U.S., the standard reference velocity is 1 microinch per second (1×10^{-6} in/sec).

A-Weighted Decibel (dBA). An overall frequency-weighted sound level in decibels which approximates the frequency response of the human ear.

Equivalent Continuous Noise Level (L_{eq}); also called the Energy-Equivalent Noise Level. The value of an equivalent, steady sound level which, in a stated time period (often over an hour) and at a stated location, has the same A-weighted sound energy as the time-varying sound. Thus, the L_{eq} metric is a single numerical value that represents the equivalent amount of variable sound energy received by a receptor over the specified duration.

Statistical Sound Level (L_n). The sound level that is exceeded “n” percent of time during a given sample period. For example, the L_{50} level is the statistical indicator of the time-varying noise signal that is exceeded 50 percent of the time (during each sampling period); that is, half of the sampling time, the changing noise levels are above this value and half of the time they are below it. This is called the “median sound level.” The L_{10} level, likewise, is the value that is exceeded 10 percent of the time (i.e., near the maximum) and this is often known as the “intrusive sound level.” The L_{90} is the sound level exceeded 90 percent of the time and is often considered the “effective background level” or “residual noise level.”

Day-Night Level (L_{dn} or DNL). The energy average of the A-weighted sound levels occurring during a 24-hour period, with 10 dB added to the A-weighted sound levels occurring during the period from 10 PM to 7 AM.

Community Noise Equivalent Level (CNEL). The energy average of the A-weighted sound levels occurring during a 24-hour period, with 5 dB added to the A-weighted sound levels occurring during the period from 7 PM to 10 PM and 10 dB added to the A-weighted sound levels occurring during the period from 10 PM to 7 AM. For general community/environmental noise,

CNEL and Ldn values rarely differ by more than 1 dB. As a matter of practice, Ldn and CNEL values are interchangeable and are treated as being equivalent in this assessment.

Sensitive Receptor. Noise- and vibration-sensitive receptors include land uses where quiet environments are necessary for enjoyment and public health and safety. Residences, schools, motels and hotels, libraries, religious institutions, hospitals, and nursing homes are examples.

7.2 SOUND CHARACTERISTICS

Noise

Sound is a pressure wave transmitted through the air. When an object vibrates, it radiates part of its energy as acoustical pressure in the form of a sound wave. Sound can be described in terms of amplitude (loudness), frequency (pitch), or duration (time). The standard unit of measurement of the loudness of sound is by decibel (dB). The human hearing system is not equally sensitive to sound at all frequencies. Sound waves below 16 Hz are not heard at all and are "felt" more as a vibration. While people with extremely sensitive hearing can hear sounds as high as 20,000 Hz, most people cannot hear above 15,000 Hz. In all cases, hearing acuity falls off rapidly above about 10,000 Hz and below about 200 Hz. Since the human ear is not equally sensitive to sound at all frequencies, a special frequency-dependent rating scale is usually used to relate noise to human sensitivity.

The A-weighted decibel scale (dBA) performs this compensation by discriminating against frequencies in a manner approximating the sensitivity of the human ear. Because of the physical characteristics of noise transmission and noise perception, the relative loudness of sound does not closely match the actual amounts of sound energy. Typical human hearing can detect changes of approximately 3 dBA or greater under normal conditions. Changes of 1 to 3 dBA are detectable under quiet, controlled conditions and changes of less than 1 dBA are usually indiscernible. A change of 5 dBA or greater is typically noticeable to most people in an exterior environment and a change of 10 dBA is perceived as a doubling (or halving) of the noise.

Physical damage to human hearing begins at prolonged exposure to noise levels higher than 85 dBA. Exposure to high noise levels affects the entire system, with prolonged noise exposure in excess of 75 dBA increasing body tensions, thereby affecting blood pressure and functions of the heart and the nervous system. In comparison, extended periods of noise exposure above 90 dBA would result in permanent cell damage. When the noise level reaches 120 dBA, a tickling sensation occurs in the human ear even with short-term exposure. This level of noise is called the threshold of feeling. As the sound reaches 140 dBA, the tickling sensation is replaced by the feeling of pain in the ear. This is called the threshold of pain. A sound level of 160 to 165 dBA will result in dizziness or loss of equilibrium.

Vibration

Vibration is an oscillatory motion through a solid medium in which the motion's amplitude can be described in terms of displacement, velocity, or acceleration. Vibration is normally associated with activities such as railroads or vibration-intensive stationary sources, but can also be associated with construction equipment, such as jackhammers, pile drivers, and hydraulic hammers. Vibration displacement is the distance that a point on a surface moves away from its original static position. The instantaneous speed that a point on a surface moves is described as the velocity, and the rate of change of the speed is described as the acceleration. Each of these descriptors can be used to correlate vibration to human response, building damage, and acceptable

equipment vibration levels. During the construction of a building, the operation of construction equipment could cause groundborne vibration. The three main wave types of concern in the propagation of groundborne vibrations are surface or Rayleigh waves, compression or P-waves, and shear or S-waves.

Surface or Rayleigh waves travel along the ground surface. They carry most of their energy along an expanding cylindrical wave front, similar to the ripples produced by throwing a rock into a lake. The particle motion is more or less perpendicular to the direction of propagation (known as retrograde elliptical). Compression or P-waves are body waves that carry their energy along an expanding spherical wave front. Shear or S-waves are also body waves, carrying their energy along an expanding spherical wave front. Unlike P-waves, however, the particle motion is transverse, or perpendicular to the direction of propagation. The particle motion in these waves is longitudinal, in a push-pull motion. P-waves are analogous to airborne sound waves.

The peak particle velocity (PPV) or the root mean square (RMS) velocity is usually used to describe vibration amplitudes. PPV is defined as the maximum instantaneous peak of the vibration signal and RMS is defined as the square root of the average of the squared amplitude of the signal. PPV is more appropriate for evaluating potential building damage, whereas RMS is typically more suitable for evaluating human response. The units for PPV and RMS velocity are normally inches per second (in/sec). Often, vibration is presented and discussed in dB units to compress the range of numbers required to describe the vibration. All PPV and RMS velocity are in in/sec and all vibration levels in this study are in dB relative to 1 micro-inch per second (abbreviated as VdB). The threshold of perception is approximately 65 VdB. Typically, groundborne vibration generated by manmade activities attenuates rapidly with distance from the source of the vibration. Manmade vibration problems are usually confined to short distances (500 feet or less) from the source.

Construction generally includes a wide range of activities that can generate groundborne vibration. In general, demolition of structures generates the highest vibrations. Vibratory compactors or rollers, pile drivers, and pavement breakers can generate perceptible amounts of vibration at distances within 200 feet of the vibration sources. Heavy trucks can also generate groundborne vibrations that vary, depending on vehicle type, weight, and pavement conditions. Potholes, pavement joints, discontinuities, differential settlement of pavement, etc., all increase the vibration levels from vehicles passing over a road surface. Construction vibration is normally of greater concern than vibration of normal traffic on streets and freeways with smooth pavement conditions. Trains generate substantial quantities of vibration due to their engines, steel wheels, and heavy loads.

Sensitive Receptors

Noise and vibration sensitive uses include land uses where quiet environments are necessary for enjoyment and public health and safety. Residences, schools, guest lodging, libraries, religious institutions, hospitals, nursing homes, and passive recreation areas are generally more sensitive to noise than commercial and industrial land use.

7.3 REGULATORY FRAMEWORK

Federal

Noise Control Act of 1972

The adverse impacts of noise were officially recognized by the federal government in the Noise Control Act of 1972,¹ which serves three purposes:

- Promulgating noise emission standards for interstate commerce
- Assisting state and local abatement efforts
- Promoting noise education and research

The Office of Noise Abatement and Control (ONAC) was initially tasked with implementing the Noise Control Act. However, the ONAC has since been eliminated, leaving the development of federal noise policies and programs to other federal agencies and interagency committees. For example, the Occupational Safety and Health Administration (OSHA) agency prohibits exposure of workers to excessive sound levels. The FTA assumed a significant role in noise control through its various operating agencies. Surface transportation system noise is regulated by a host of agencies, including the FTA. Transit noise is regulated by the FTA, while freeways that are part of the interstate highway system are regulated by the Federal Highway Administration (FHWA). The federal government encourages local jurisdictions to use their land use regulatory authority to site new development to minimize potential noise impacts.

State

Senate Bill (SB) 860

SB 860, which became effective on January 1st, 1976, directed the California Office of Noise Control within the State Department of Health Services to prepare the *Guidelines for the Preparation and Content of Noise Elements of the General Plan*.² One purpose of these guidelines was to provide sufficient information concerning the noise environment in the community so that noise could be considered in the land-use planning process. As part of this publication, Land Use Compatibility Standards were developed in four categories depicting the acceptability of noise levels for a variety of uses: Normally Acceptable, Conditionally Acceptable, Normally Unacceptable, and Clearly Unacceptable (Table G.3-1, *Land Use Compatibility Matrix*). These categories were based on earlier work conducted by the U.S. Department of Housing and Urban Development.

¹ 42 U.S.C., Noise Control Act of 1972, § 4901-4918.

² California Department of Health Services, Office of Noise Control. February 1976. *Guidelines for the Preparation and Content of Noise Elements of the General Plan*.

**TABLE 7.3-1
LAND USE COMPATIBILITY MATRIX**

Land Use Category	Community Noise Exposure (L_{dn} or CNEL, dB)					
	55	60	65	70	75	80
Residential - Low Density Single-Family, Duplex, Mobile Homes	Green	Green				
	Yellow	Yellow	Yellow			
				Orange		Red
Residential - Multi-Family	Green	Green	Green			
		Yellow	Yellow			
				Orange		Red
Transient Lodging - Motels Hotels	Green	Green	Green			
		Yellow	Yellow			
				Orange	Orange	Red
Schools, Libraries, Churches, Hospitals, Nursing Homes	Green	Green	Green			
		Yellow	Yellow			
				Orange	Orange	Red
Auditoriums, Concert Halls, Amphitheaters	Yellow	Yellow	Yellow			
				Red	Red	Red
Sports Arena, Outdoor Spectator Sports	Yellow	Yellow	Yellow	Yellow		
					Red	Red
Playgrounds, Neighborhood Parks	Green	Green	Green			
				Orange		
					Red	Red
Golf Courses, Riding Stables, Water Recreation, Cemeteries	Green	Green	Green	Green		
					Orange	Orange
						Red
Office Buildings, Business Commercial and Professional	Green	Green	Green			
				Yellow	Yellow	
					Orange	Orange
Industrial, Manufacturing, Utilities, Agriculture	Green	Green	Green	Green		
				Yellow	Yellow	
					Orange	Orange
Green	Normally Acceptable - Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.					
Yellow	Conditionally Acceptable - New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply system or air conditioning will normally suffice.					
Orange	Normally Unacceptable - New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made and needed noise insulation features included in the design.					
Red	Clearly Unacceptable - New construction or development should generally not be undertaken.					

SOURCE: Adapted from: Governor's Office of Planning and Research. 2017. *State of California General Plan Guidelines and Technical Advisories*. Appendix D, Noise Element Guidelines, Figure 2. https://opr.ca.gov/docs/OPR_Appendix_D_final.pdf.

The State has developed a land-use compatibility matrix for community noise environments that further defines four categories of acceptance and assigns CNEL values to them. In addition, the State Building Code (Part 2, Title 24, California Code of Regulations) establishes uniform minimum noise insulation performance standards to protect persons within new hotels, motels, dormitories, long-term care facilities, apartment houses, and residential units other than detached single-family residences from the effects of excessive noise, including, but not limited to, hearing loss or impairment and interference with speech and sleep. Residential structures to be located where the CNEL or day-night average sound level (L_{dn}) is 60 dBA³ or greater are required to provide sound insulation to limit the interior CNEL to a maximum of 45dBA. An acoustic, or noise, analysis report prepared by an experienced acoustics engineer is required for the issuance of a building permit for these structures. Conversely, land use changes that result in increased noise levels at residences of 60 dBA or greater must be considered in the evaluation of impacts to ambient noise levels. The acceptability of ambient noise levels for a variety of uses is shown in Table 3.2-1). In addition, the State Guidelines for Noise Elements address the relationship between the enjoyment of open space and noise:

“Open Space-Excessive noise can adversely affect the enjoyment of recreational pursuits in designated open space. Thus, noise exposure levels should be considered when planning for this kind of open-space use. Conversely, open space can be used to buffer sensitive land uses from noise sources through the use of setbacks and landscaping. Open-space designation can also effectively exclude other land uses from excessively noisy areas.”

Ambient noise levels of 67 dBA or greater are normally unacceptable for playgrounds and neighborhood parks, while golf courses, riding stables, and water recreation areas are normally acceptable up to 70 dBA (Table 3.2-1).

Local

City of Los Angeles General Plan Noise Element

The City has established three policies in the General Plan related to noise, of which Policy 3.1 is relevant to the proposed project:⁴

Policy 3.1: Develop land use policies and programs that will reduce or eliminate potential and existing noise impacts.

City of Los Angeles Municipal Code

Exterior Noise Standards: As specified in Sections 112.02 and 112.05 of the City of Los Angeles Municipal Code, noise attributable to mechanical equipment (such as heating, air conditioning, and ventilation equipment (HVAC) systems or any pumping, filtering, or heating equipment) cannot exceed the ambient noise level by more than 5 decibels. Ambient noise levels can be as-measured at the project site or established via Code-presumed levels. For the nearby residential neighborhood (Zone R1), the presumed ambient levels are 50 dBA (daytime, 7:00 AM to 10:00

³ A-weighted decibels, or the relative loudness of sounds in air as perceived by the human ear. In the A-weighted system, the decibel values of sounds at low frequencies are reduced, compared with unweighted decibels, in which no correction is made for audio frequency.

⁴ City of Los Angeles Department of City Planning. Adopted 3 February 1998. *Noise Element of the Los Angeles City General Plan*. https://planning.lacity.org/odocument/b49a8631-19b2-4477-8c7f-08b48093cddd/Noise_Element.pdf

PM) and 40 dBA (nighttime, 10:00 PM to 7:00 AM). Power equipment, including lawn mowers, backpack blowers, small lawn and garden tools, and riding tractors are restricted to no more than 65 dBA Leq at residential properties.

Construction Noise Standards: The City of Los Angeles has established policies and regulations concerning the generation and control of noise that could adversely affect noise sensitive land uses. For construction noise, Los Angeles Municipal Chapter XI of the Los Angeles Municipal Code (LAMC) provides noise regulations for the City of Los Angeles, as referenced in Section 41.40 of Chapter IV.⁵ The construction noise regulations included in the municipal code are:

- No person shall, between the hours of 9:00 p.m. and 7 a.m. of the following day, perform any construction or repair work of any kind.. [which] entails the use of ... equipment which makes loud noises to the disturbance of persons occupying sleeping quarters in any dwelling hotel or apartment or other place of residence.
- The provisions do not apply to construction work done in any district zoned for manufacturing or industrial land uses.

No person, other than an individual home owner engaged in the repair or construction of his/her single-family dwelling, shall perform any construction or repair work of any kind or perform such work (or operation, repair or servicing of construction equipment and the job-site delivering of construction materials) within 500 feet of land so occupied before 8:00 AM or after 6:00 PM on any Saturday or on a federal holiday, or at any time on Sunday. Under certain conditions, the City may grant a waiver to allow limited construction activities to occur outside of the limits described above. This code does not apply to emergency repair work.

LAMC Section 112.05 (Maximum Noise Level of Powered Equipment or Powered Hand Tools)⁷ states that “Between the hours of 7:00 a.m. and 10:00 p.m., in any residential zone of the City or within 500 feet thereof, no person shall operate or cause to be operated any powered equipment or powered hand tool that produces a maximum noise level exceeding the following noise limits at a distance of 50 feet therefrom: (a) 75dB(A) for construction, industrial, and agricultural machinery including crawler-tractors, dozers, rotary drills and augers, loaders, power shovels, cranes, derricks, motor graders, paving machines, off-highway trucks, ditchers, trenchers, compactors, scrapers, wagons, pavement breakers, compressors and pneumatic or other powered equipment...”

However, this noise limitation does not apply where compliance is technically infeasible. Technically infeasible means the above noise limitation cannot be met despite the use of mufflers, shields, sound barriers and/or any other noise reduction device or techniques during the operation of equipment.

City of Los Angeles CEQA Thresholds Guide

The Los Angeles CEQA Thresholds Guide provides construction noise limitation guidelines. From this guide, “a project would normally have a significant impact with regard to exterior noise levels resulting from project operations if the project causes noise measured at the property line of a noise sensitive receptor to increase by 3 dBA in CNEL to or within the ‘normally unacceptable’ or

⁵ City of Los Angeles. 2023. Los Angeles Municipal Code, Chapter IV: Public Welfare. https://codelibrary.amlegal.com/codes/los_angeles/latest/lamc/0-0-0-193741

'clearly unacceptable' category; or any 5 dBA or greater noise increase."⁶ A significant impact on noise levels from construction would occur if:

- Construction activities lasting more than one day would exceed existing ambient exterior noise levels by 10 dBA or more at a noise sensitive use.
- Construction activities lasting more than 10 days in a three-month period would exceed existing ambient exterior noise levels by 5 dBA or more at a noise sensitive use; or
- Construction activities would exceed the ambient noise level by 5 dBA at noise sensitive use between the hours of 9:00 p.m. and 7:00 a.m. Monday through Friday, before 8:00 a.m. or after 6:00 p.m. on Saturday, or at any time on Sunday.

This traffic and pedestrian safety assessment has been prepared by Linscott, Law & Greenspan, Engineers (LLG) to review the traffic and pedestrian circulation associated with the peak construction activities and operations related to the Washington Irving Middle School Major Modernization Project (the “proposed Project”) at Washington Irving Middle School Math Music Engineering Magnet (Irving MS). The proposed Project is located at 3010 Estara Avenue in the Northeast Los Angeles Community Plan Area of the City of Los Angeles, California. The Los Angeles Unified School District (LAUSD) has identified schools within the District in critical need of building replacement, renovations, and reconfiguration. The Project is part of the LAUSD’s School Upgrade Program (SUP) that seeks to improve and modernize aging schools. This memorandum was prepared in accordance with the LAUSD Standard Conditions (SCs) of Approval for District Construction, Upgrade, and Improvement Projects¹ as it relates to pedestrian safety and transportation and circulation.

This memorandum includes a summary of the following: 1) existing site conditions; 2) proposed Project description; 3) existing overall traffic volumes and general observed circulation patterns; 4) planned construction schedule and estimated peak construction traffic trip generation; 5) pedestrian and emergency vehicle access during construction; 6) review of City of Los Angeles High Injury Network; and 7) conclusions and recommendations for usage of the loading zones along West Avenue 32, Estara Avenue, Fletcher Drive, and Marguerite Street at Project completion. General measures were also recommended for the School as it relates to pick-up/drop-off loading zones and general School policies regarding notification of overall pick-up and drop-off procedures following completion of the proposed Project.

Existing Site Conditions

The existing Irving MS campus is developed on a 11.2-acre parcel located at 3010 Estara Avenue in the Northeast Los Angeles Community Plan Area of the City of Los Angeles, California. The School site is generally bounded by Fletcher Drive to

¹ Los Angeles Unified School District Standard Conditions of Approval for District Construction, Upgrade, and Improvement Projects, updated 2018.

the north, Marguerite Street to the south, Estara Avenue to the east, and West Avenue 32 to the west. Speed humps are installed on West Avenue 32 and Marguerite Street bordering the Project site. The Project site location is shown in *Figure 1*.

The existing Irving MS is operated by LAUSD and contains 11 permanent buildings and six portable buildings to serve students in grades sixth through eighth grade. The current bell schedule for the School is 8:00 AM to 3:14 PM for regular school days, 8:00 AM to 1:53 PM for Tuesday professional development days, and 8:00 AM to 12:43 PM for minimum days. In addition, the existing campus contains Isana Octavia Academy that serves students in grades third through eighth grade, City of Angels Community School that serves students in grades Kindergarten (K) through 12th grade, and various instructional programs (STEAM25 Magnet Program, Dual Language Program, Special Education for the visually impaired, and LACER Afterschool program) that serve students in grades K through eighth grade. The existing site conditions of the study area, including signage and parking restrictions in the area are illustrated in *Figure 2*.

As shown in *Figure 2*, the main drop-off/pick-up loading zone for the Irving MS is located at the south side of the Irving MS campus: along the north side of Marguerite Street between West Avenue 33 and Estara Avenue. This zone is posted with signage indicating “Passenger Loading Only” for drop-off/pick-up loading activities before and after school (i.e., between 6:30 AM and 9:00 AM and 1:30 PM and 4:00 PM) during school days only (Mondays through Fridays). Time-restricted (i.e., two-hour) parking is permitted between 9:00 AM and 1:30 PM on school days for this portion of Marguerite Street. In addition, a secondary drop-off/pick-up loading zone is located along the south side of Fletcher Drive, just west of an existing pedestrian gate (Fletcher Gate). The secondary Fletcher Drive loading zone is designated with sandwich board signage for drop-off/pick-up loading activities between 7:30 AM and 8:10 AM and 2:55 PM and 3:30 PM during school days only. Time-restricted (i.e., 15-minute) parking is permitted between 7:00 AM and 5:00 PM on school days for this portion of Fletcher Drive. Further, a secondary drop-off/pick-up loading zone for Isana Octavia Academy is located along the north side of Marguerite Street west of West Avenue 33 via cones. The secondary Marguerite Street loading zone is designated with sandwich board signage for drop-off/pick-up loading activities between 7:00 AM and 8:00 AM and 2:45 PM and 2:55 PM during school days only. Parking is prohibited between 7:00 AM and 5:00 PM on school days. No posted signage for a formal drop-off or pick-up loading zone was observed on Estara Avenue.

The School also operates up to nine school buses, including one bus for Special Education students. The majority of the bus loading/unloading activities occur along

the campus frontage on the east side of West Avenue 32 with some bus loading/unloading activities (including the Special Education students' bus) occurring on-site within the parking lot (former Roswell Street). Signage indicating "Tow Away No Stopping" between 7:00 AM and 5:00 PM on school days, with school buses being exempt, is posted along the east side of West Avenue 32.

Vehicular access to the on-site parking areas is provided via four existing driveways: one driveway along the west side of Estara Avenue (Vehicular Access 1 for access to the former Roswell Street, which has been incorporated into the Irving MS Campus, and the on-site surface parking lot), one driveway along the south side of Fletcher Drive (Vehicular Access 2 for access to the former Moss Avenue, which has been incorporated into the Irving MS Campus, and the on-site surface parking lot), and two driveways along the east side of West Avenue 32 (Vehicular Access 3 and Vehicular Access 4). All of the on-site parking spaces are currently utilized by the staff/administration for the School as well as visitors.

Existing pedestrian access to the Irving MS campus is provided via seven existing pedestrian gates: 1) one pedestrian gate along the west side of Estara Avenue at the former Roswell Street (Visitor Entrance); 2) one pedestrian gate along the west side of Estara Avenue at the Irving MS main entrance (Main Gate); 3) one pedestrian gate along the north side of Marguerite Street; 4) one pedestrian gate along the north side of Marguerite Street serving Isana Octavia Academy (Octavia Gate 1); 5) one pedestrian gate along the east side of West Avenue 32 serving various instructional programs (Magnet Gate); 6) one pedestrian gate along the south side of Fletcher Drive serving the City of Angels Community School (Octavia Gate 3); and 7) one pedestrian gate along the south side of Fletcher Drive and adjacent to the Vehicular Access 2 driveway (Fletcher Gate).

Existing public sidewalks and pedestrian facilities are provided along the Irving MS campus frontages. As noted in the Initial Study², a public sidewalk approximately four feet in width (excluding landscaping) is provided along the Irving MS campus West Avenue 32 frontage. The Initial Study also noted erosion along the western and southern areas of the campus that affected the sidewalk along West Avenue 32. North of the Vehicular Access 1 driveway, a public sidewalk approximately 16 feet in width is provided along the Irving MS campus Estara Avenue frontage. South of the Vehicular Access 1 driveway, a public sidewalk approximately five feet in width (excluding landscaping) is provided along the Estara Avenue frontage. A public sidewalk approximately 11 feet in width is provided along the Irving MS campus Fletcher Drive frontage. A public sidewalk approximately four feet in width

² *Irving Middle School Major Modernization Project Screencheck Initial Study*, prepared by Sapphos Environmental, Inc., October 2023.

(excluding landscaping) is provided along the Irving MS campus Marguerite Street frontage. Existing street trees and landscaping are also provided along the Irving MS campus frontages.

Americans with Disabilities Act (ADA) access ramps, including some with the yellow truncated domes, are provided at the following intersections and locations in the direct vicinity of the Irving MS campus:

- West Avenue 32 (South Leg) / Fletcher Drive
- West Avenue 32 (North Leg) / Fletcher Drive
- Vehicular Access 2 Driveway (formerly Moss Avenue) / Fletcher Drive
- Estara Avenue / Fletcher Drive
- Estara Avenue / Marguerite Street
- West Avenue 33 / Marguerite Street

Traditional yellow continental style pedestrian crosswalks are provided at the following intersections in the direct vicinity of the Irving MS campus:

- West Avenue 32 (South Leg) / Fletcher Drive
- West Avenue 32 (North Leg) / Fletcher Drive
- Estara Avenue / Fletcher Drive
- Estara Avenue / Marguerite Street
- West Avenue 33 / Marguerite Street

Pedestrian push buttons and rectangular rapid flashing beacons (RRFBs) are presently installed along Fletcher Drive at the western leg of the West Avenue 32 (South Leg) / Fletcher Drive intersection. In addition, pedestrian crossing signals and push buttons are presently included as part of the traffic signal controls at the Estara Avenue / Fletcher Drive signalized intersection.

Project Description

The Washington Irving Middle School Major Modernization Project is intended to revitalize the existing campus to provide 21st century learning environments to support specialized programs that distinguish Irving MS as a school offering unique learning opportunities. The Project provides for the replacement of permanent and portable buildings along with hardscape, landscape and parking areas. Specifically, the Project site is located within an Alquist Priolo Earthquake Fault Zone, with the

Hollywood Fault and the Raymond Fault running beneath the Irving MS campus. Therefore, the Project proposes to alleviate existing structural and seismic deficiencies in the buildings on-site by removing the buildings located over the fault and replacing the removed buildings with new construction at least 50 feet away from the fault. Any areas located directly above the fault would be converted into outdoor areas, such as hardscape, landscape, or parking areas. The Project consists of the demolition of three existing permanent classroom buildings (approximately 62,442 square feet) and the removal of six existing portable bungalow buildings and one accessory service building (approximately 12,172 square feet) on the Irving MS campus; replacement with construction of a permanent Administration and Classroom building (approximately 55,000 square feet), a permanent Maintenance and Operations building (approximately 2,600 square feet), and two portable classroom buildings (approximately 2,400 square feet); modernization, seismic and structural retrofitting for an existing Auditorium building (approximately 14,957 square feet); improving portions the playground areas; completion of site upgrades including hardscape areas, landscape areas, and parking areas; and providing ADA upgrades. No changes to the student enrollment capacity are contemplated with the completion of the proposed Project. The proposed site plan is shown in *Figure 3-A* and the proposed demolition plan is shown in *Figure 3-B*.

Based on the site organization diagram shown in *Figure 3-A*, the proposed Project would not change the existing use of the site, increase the student enrollment capacity of the School, or alter the existing sidewalks surrounding the Project site. The proposed Project is limited to modernizing the campus itself, including repaving ground surfaces to facilitate ADA access and demolishing and replacing other buildings on campus.

As part of the site enhancements of the proposed Project, one new vehicular access point would be provided along the north side of Marguerite Street to provide access to approximately 30 new parking spaces. In addition, an existing pedestrian access gate along the south side of Fletcher Drive (Octavia Gate 3) would be relocated, as the City of Angels Community School would be relocated elsewhere on-campus or off-campus. As the Project does not anticipate any relocation of the existing vehicular access points and does not anticipate removal or relocation of the remaining existing pedestrian access points, it is anticipated that the primary passenger loading zone will continue to be provided along the north side of Marguerite Street, similar to current conditions. Any late arrivals or access to campus during school hours would require controlled entry and access via Marguerite Street or Estara Avenue with check-in required at the new Administration Office building. The proposed Project would remove approximately 45 existing on-site parking spaces south of the former Roswell

Street in order to accommodate the new buildings and would add approximately 30 parking spaces on-site north of Marguerite Street for teachers/visitors.

Existing Traffic Volumes

Manual counts of vehicular turning movements were conducted at four (4) intersections in the vicinity of the Irving MS campus during the weekday morning (AM) and afternoon (PM) school peak periods to determine the peak hour traffic volumes. The traffic counts were conducted by an independent traffic count subconsultant (Counts Unlimited) from 7:00 AM to 9:00 AM to determine the weekday school AM peak hour, and from 2:00 PM to 4:00 PM to determine the weekday school PM peak hour. In conjunction with the manual turning movement vehicle counts, a count of bicycle and pedestrian volumes were also collected during the peak periods. It is noted that all of the traffic counts were conducted on Thursday, October 19, 2023 during a typical regular mid-week school day. The subject count locations are summarized as follows and also illustrated in *Figure 1*:

- West Avenue 32 (South Leg) / Fletcher Drive
- West Avenue 32 (North Leg) / Fletcher Drive
- Estara Avenue / Fletcher Drive
- Estara Avenue / Marguerite Street

The weekday AM and PM peak hour manual counts of vehicle turning movements at the subject intersections are shown in *Figure 4*. Summary data worksheets of the manual traffic counts at the subject intersections, as well as the pedestrian and bicycle counts, are contained in *Attachment A*.

As mentioned previously, a count of the pedestrian volumes was also conducted during the morning and afternoon school peak periods in conjunction with the vehicle counts. *Figure 5* illustrates all pedestrian crossing volumes at the subject intersections during the weekday morning and afternoon peak hours. As shown in *Figure 5*, the majority of the pedestrian crossings occurred at existing crosswalks at the south, east, and west legs of the Estara Avenue / Fletcher Drive intersection, and across the south leg of the Estara Avenue / Marguerite Street intersection. One crossing guard was observed at the east leg of the Estara Avenue / Fletcher Drive intersection.

General Observed Inbound and Outbound Circulation Patterns

Field observations were conducted at the main Irving MS loading area (i.e., on Marguerite Street) during the morning drop-off peak period (i.e., between 7:15 AM and 8:15 AM) and afternoon pick-up peak period (i.e., between 2:30 PM and 3:30 PM) during a typical mid-week school day (Thursday, October 5, 2023). It is noted that field observations were also conducted at the secondary loading areas (i.e., Estara Avenue, Fletcher Drive, and West Avenue 32). **Figure 6** depicts the existing overall inbound and outbound circulation routes for all loading areas as discussed further below.

Marguerite Street Morning Drop-off/Circulation Patterns

During the morning drop-off period, the majority of guardians conducted student drop-off procedures by entering the main on-street loading zone along the north side of Marguerite Street, as well as parking or stopping along the south side of Marguerite Street and stopping along the east and west sides of Estara Avenue along the campus frontages. For Marguerite Street, vehicles were observed to park or stop along the north and south sides of Marguerite Street, from west of West Avenue 33 to Estara Avenue. In addition, vehicles were observed to conduct drop-off operations along the east side of West Avenue 33 just south of Marguerite Street. Eastbound and westbound vehicle queues were also observed along Marguerite Street. Some Irving MS students and guardians were observed to cross Marguerite Street without utilizing the crosswalk at the Estara Avenue / Marguerite Street intersection, causing vehicles to stop along Marguerite Street to allow pedestrians to cross the street, which contributed to the eastbound and westbound vehicle queues along Marguerite Street. While cones and one monitor was stationed near Octavia Gate 1 along the north side of Marguerite Street, no monitors were stationed for Irving MS along the north side of Marguerite Street to assist in the processing of vehicles within and approaching the Marguerite Street loading zone/gated pedestrian access. Vehicles were observed to approach the campus from both eastbound and westbound Marguerite Street.

Estara Avenue Morning Drop-off/Circulation Patterns

For Estara Avenue, vehicles were observed to park or stop along the east and west sides of Estara Avenue, from Fletcher Drive to Marguerite Street. In addition, vehicles were observed to utilize the existing Vehicular Access 1 driveway on Estara Avenue to enter and exit the Irving MS parking lot. The Vehicular Access 1 driveway was observed to accommodate full vehicular access (i.e., left-turn and right-turn ingress and egress turning movements), which resulted in vehicles stopping at the driveway and along Estara Avenue to avoid vehicular conflicts, subsequently resulting in northbound and southbound vehicle queues along Estara Avenue. In addition, many Irving MS students and some guardians were observed to cross Estara

Avenue without utilizing the crosswalk at the Estara Avenue / Fletcher Drive intersection to the north or the crosswalk at the Estara Avenue / Marguerite Street intersection to the south, causing vehicles to stop mid-block along Estara Avenue to allow pedestrians to cross the street, which also contributed to the northbound and southbound vehicle queues. While one monitor was stationed at the Vehicular Access 1 driveway to stop vehicles and allow pedestrians to cross the driveway, the monitor did not help facilitate unloading activities for students dropped off along the west side of Estara Avenue. Vehicles were also observed to stop and conduct drop-off operations outside of the roadway along the west side of Estara Avenue (between the Vehicular Access 1 driveway and the Estara Avenue Visitor Entrance gate) which warranted the monitor to assist with potential pedestrian/vehicular conflicts in this area. Vehicles were observed to approach the campus from both northbound and southbound Estara Avenue.

Fletcher Drive Morning Drop-off/Circulation Patterns

Some guardians also utilized the secondary loading zone along the south side of Fletcher Drive to conduct drop-off operations. For the unloading activities on Fletcher Drive, vehicles were observed to park or stop along the south side of Fletcher Drive, from approximately Octavia Gate 3 to Estara Avenue. It is noted that the Vehicular Access 2 driveway was gated during the drop-off period, except to permit two school buses and one school bus for Special Education students. Therefore, passenger vehicles were also observed to stop along the Vehicular Access 2 driveway when the gate was closed to conduct drop-off operations. While one monitor was stationed at the Vehicular Access 2 driveway, the monitor would open and close the driveway's gate for the school buses and did not help facilitate unloading activities for students dropped off along the south side of Fletcher Drive. In addition, while most vehicles arrived to drop off students via eastbound Fletcher Drive and departed by continuing on eastbound Fletcher Drive, a few vehicles were observed to arrive via eastbound Fletcher Drive and depart by conducting u-turn maneuvers to head westbound on Fletcher Drive.

West Avenue 32 Morning Drop-off/Circulation Patterns

School buses were observed to utilize the east side of West Avenue 32 as well as the Vehicular Access 2 driveway along the south side of Fletcher Drive to conduct drop-off operations. No vehicles were observed to conduct morning drop-off along West Avenue 32 as this portion is signed for "Tow Away No Stopping" between 7:00 AM and 5:00 PM on school days, with school buses being exempt. *Figure 7* depicts the existing overall inbound and outbound circulation routes for school buses (i.e., along the east side of West Avenue 32 and on-site via the Vehicular Access 2 driveway along the south side of Fletcher Drive).

Afternoon Pick-Up Loading/Circulation Patterns

The vehicle circulation pattern for the afternoon pick-up period is generally similar to the morning drop-off period. As is typical for schools, the processing time for students to be located and ready for arriving parents/guardians generally took longer than the morning drop-off activities. It is noted that the Vehicular Access 2 driveway's gate was open to both school buses as well as passenger vehicles during the afternoon pick-up period. However, few vehicles were observed to utilize the Vehicular Access 2 driveway and most vehicles were observed to either park along the south side of Fletcher Drive, head to the Vehicular Access 1 driveway, or head to Marguerite Street to pick up students. More vehicles were observed to use the on-site parking lot in the afternoon pick-up period compared to the morning drop-off period. It is noted that no monitors were stationed at the Vehicular Access 1 driveway or the Vehicular Access 2 driveway during the afternoon pick-up period. Vehicles were also observed to double park along the north and south sides of Marguerite Street to conduct loading activities during the afternoon pick-up period.

Construction Schedule

Based on information provided in the Initial Study, it has been determined that the duration of the Project construction activities is expected to total 42 months, beginning in the first quarter of year 2026 and ending by the third quarter of 2029. In order to maintain active school operation during the construction phase, required parking and adequate vehicle circulation is expected to be maintained and less than 50 percent of the campus would be disturbed at any one time. The general construction phases by development zones are as follows:

- Development Zone A - Phase 1: Set-up Interim Housing
- Development Zone B - Phase 2: Demolish Administration Building
- Development Zone B - Phase 3: Construct New Administration and Classroom Building
- Development Zone C - Phase 4: Remove Homemaking Building, Classroom Building, 6 Bungalows, and Interim Housing
- Development Zone D - Phase 5: Landscaping, Hardscaping, Parking Site Work

Based on the initial phasing of the work determined, this analysis assumes that there will be five general activity construction phases occurring in four separate development zones, as shown below. The actual duration of construction activity may likely be longer; however, by assuming the shortest expected construction duration this study is taking a more conservative approach due to the higher intensity of the construction activities. The construction equipment and number of

construction workers on-site is estimated based on projects of comparable size and land uses.

The general construction activities and duration for each phase are as follows:

- Demolition (120 days: 1/2026 – 6/2026)
- Site Preparation (150 days: 6/2026 – 1/2027)
- Building Construction (650 days: 1/2027 – 7/2029)
- Paving (36 days: 7/2029 – 9/2029)
- Architectural Coating (10 days: 9/2029 – 9/2029)

An estimated average of 50 workers would be on-site when students are present and a maximum of 150 workers would be on-site during peak periods (i.e., during summer break). No summer school sessions are currently held or planned to be held during the summer months. It is anticipated that construction worker parking would generally be accommodated on-site in the staging area during all phases of construction. Construction workers would not be permitted to park on local streets and would therefore not affect the current usage of street parking.

To the extent feasible, construction-related activities would be scheduled to occur during daylight hours. Construction-related traffic and deliveries would be scheduled to avoid student pick-up/drop-off hours, and during noise sensitive times as coordinated with the School administration. The City's Noise Ordinance currently limits construction hours on Mondays through Fridays to no earlier than 7:00 AM and no later than 9:00 PM. On Saturdays, construction hours are limited to no earlier than 8:00 AM and no later than 6:00 PM. No construction is permitted on Sundays.

It has been determined that the most intensive period of overall construction activity and construction truck traffic generation is expected to occur during the Site Preparation phase for an approximate six-month period. Other phases of construction are expected to be less intensive in terms of overall construction truck traffic generation. The most intensive period in terms of the other miscellaneous delivery trucks would occur during the Building Construction phase for an approximate 30-month period. While it is recognized that these two phases are not expected to overlap (i.e., Site Preparation and Building Construction), they were assumed to be concurrent in order to provide a conservative analysis and to provide greater flexibility as the actual final phasing of the work has not yet been determined.

Peak Construction Traffic Trip Generation

Traffic generation is expressed in vehicle trip ends, defined as one-way vehicular movements, either entering or exiting the generating land use. Trip generation equations and/or rates provided in the ITE *Trip Generation Manual* publication³ were not utilized to forecast traffic generation for the construction activities, as the ITE document does not contain trip rates for specifically this type of expected construction-related hauling operation. Therefore, the construction trip generation forecast was derived based on the development of construction worker and truck forecasts given the expected hauling/delivery capacities as well as the application of passenger car equivalency (PCE) factors, as described more fully below.

Haul Trucks

In developing the forecast of peak truck trip generation, several factors were taken into consideration:

- Hours of Hauling Operation
- Capacity of Haul Trucks
- Application of PCE Factors

For regional construction traffic accessing State Route 2 (SR-2), access would be via the San Fernando Road on/off-ramps southwest of the site, or via Eagle Rock Boulevard ramps east of the site, before turning onto Avenue 36 to Fletcher Drive. The site has been in operation adjacent to Fletcher Drive and would expect to continue to maintain operation through construction.

It is anticipated that construction vehicles related to the export activities will have a capacity of approximately 14 cubic yards per truck. It has also been assumed for analysis purposes that all hauling activities would be limited to no earlier than 9:00 AM and end no later than 5:00 PM. As noted above, in order to account for the effect that trucks have on overall intersection operations, PCE factors were incorporated into the analysis of potential construction-related traffic impacts. Based on a review of the size of haul trucks expected to be utilized, a PCE factor of 2.5 was incorporated into the traffic analysis (i.e., it is assumed that a single 14 cubic yard haul truck has the same overall effect on traffic operations as 2.5 passenger cars). This assumption is conservative and accounts for the heavy vehicle type and slower speeds when fully loaded. The traffic generation forecast assuming the use of 14-cubic yard capacity haul trucks is summarized in **Table 1**.

³ *Trip Generation Manual*, Institute of Transportation Engineers, 11th Edition, 2021.

The most intensive period of overall construction activity and construction truck traffic generation is expected to occur during the Site Preparation phase for an approximate six-month period. The Site Preparation phase would include the removal of existing building materials (i.e., 62,442 square feet), vegetation clearing, removal of unwanted materials from the site, and removal of any portable buildings. During the peak, up to 70 trucks per day (i.e., 35 inbound trucks and 35 outbound trucks) are anticipated. Assuming a total of eight hours of hauling activities each day, it is estimated that approximately four truck loads (i.e., resulting in four inbound trucks and four outbound trucks) would occur per hour. When accounting for the application of a passenger car equivalency (PCE) factor of 2.5 to account for the heavier weight and larger size haul trucks, a total of 10 inbound truck PCE trips and 10 outbound truck PCE trips could potentially occur during the weekday AM and PM peak hours.

Equipment and Delivery Trucks

In addition to construction haul trucks, additional trips may be generated by miscellaneous trucks traveling to and from the Project site. These trucks may consist of trucks delivering equipment and/or construction materials to the Project site. In addition, smaller pick-up trucks or four-wheel drive vehicles used by construction supervisors and/or City inspectors are expected to be generated to and from the site. During the peak phase for deliveries (i.e., Building Construction), up to 12 delivery trucks are anticipated for this phase. It is estimated that if these deliveries all occur on a concentrated single day of that phase, up to 24 trucks per day (i.e., 12 inbound trucks and 12 outbound trucks) would be generated to and from the site. To conservatively estimate the equivalent number of passenger vehicles associated with the trucks, a PCE factor of 2.0 was utilized based on standard traffic engineering practice. Therefore, assuming 24 daily trucks per day, it is estimated that the trucks would generate approximately 48 daily PCE vehicle trips (i.e., 24 inbound PCE trips and 24 outbound PCE trips). It is also estimated that approximately eight (8) PCE vehicle trips (4 inbound PCE trips and 4 outbound PCE trips) could occur during each of the weekday AM and PM peak hours.

Construction Workers/Employees

The most intensive period in terms of the number of construction workers would occur during the summer months with up to a maximum of 150 workers during the peak periods. Based on confirmation from School representatives, summer school classes are not held at this campus and would not overlap with the 150 workers which are anticipated to be on-site during the summer months. During the overlap with concurrent School operations, it is anticipated that an average of 50 workers would be on-site. For purposes of this review, the number of construction workers were

reviewed during the concurrent operation of the School when students are present on-site. Construction workers are expected to arrive at the Project site before 7:00 AM. Since the construction workday would commence by 7:00 AM, these trips would occur outside of the weekday commute AM peak hour, but could occur during the weekday PM peak hour. Assuming the typical workday ends at 3:30 PM, fifty percent (50%) of the workers are assumed to leave the site between 3:30 PM and 4:00 PM, twenty-five percent (25%) between 4:00 PM and 4:30 PM, and the remaining twenty-five percent (25%) after 4:30 PM (including supervisors). Thus, while these construction worker trips would generally occur outside of the commute PM peak hour of adjacent street traffic, fifty percent (50%) of the work force (i.e., 25 workers) has been assumed to overlap with the weekday commute PM peak hour (i.e., between 5:00 PM and 6:00 PM) in order to provide a conservative forecast of construction worker traffic generation. The construction worker arrival and departure times are expected to occur outside of the peak hour of student pick-up/drop-off operations as well (i.e., before 7:00 AM and after 3:30 PM).

It is anticipated that construction workers would primarily remain on-site throughout the day. The number of construction worker vehicles is estimated using an average vehicle ridership (AVR) factor of 1.135 persons per vehicle (as provided in the South Coast Air Quality Management District in its CEQA Air Quality Handbook). Therefore, it is estimated that approximately 88 vehicle trips (44 inbound trips and 44 outbound trips) on a daily basis would be generated to/from the site by the construction workers during the peak period when a total of 50 construction workers are expected to be on-site. With fifty percent (50%) of the workers conservatively assumed to overlap with the weekday PM peak hour, this would result in 22 outbound construction worker vehicle trips.

Total Construction Traffic Generation

Taken together as summarized in *Table 1*, the construction haul trucks, miscellaneous delivery vehicles, and construction worker vehicles are forecast to generate up to 28 weekday AM peak hour PCE vehicle trips (i.e., 14 inbound PCE trips and 14 outbound PCE trips). During the PM peak hour, the construction traffic generation is expected to total 50 PCE vehicle trips (i.e., 14 inbound PCE trips and 36 outbound PCE trips). Over a 24-hour period, the construction traffic generation is forecast to generate an increase of 312 daily PCE trip ends during a typical weekday (156 inbound PCE trips and 156 outbound PCE trips).

For comparison purposes, traffic generation for the existing Irving MS campus was estimated based on the trip generation rates published in the *ITE Trip Generation Manual* for Land Use Code 522 (Middle School/Junior High School) and applied to the existing number of students. When compared to the traffic generated by the

operations of the School (i.e., 429 AM peak hour vehicle trips, 96 PM peak hour vehicle trips, and 1,344 daily vehicle trips), the short-term construction traffic anticipated during the peak construction activities are anticipated to be less than the daily operations of the Irving MS. In fact, daily traffic generation for site operations are expected to be higher as the campus also serves a number of students in Grades K through 12 through various other programs held on campus (i.e., STEAM25 Magnet Program, Dual Language Program, Special Education for the visually impaired, LACER Afterschool program, Isana Octavia Academy, and City of Angels Community School).

Pedestrian Access During Construction Activities

Due to the multiple loading areas on campus for the various programs, existing sidewalks along Fletcher Drive, Estara Avenue, Marguerite Street, and West Avenue 32 are expected to be maintained, depending upon the construction phasing activities. In addition, the following intersections with continental style crosswalks generally utilized for access to/from campus are expected to be maintained during construction activities:

- Four legs of the intersection of Estara Avenue / Fletcher Drive
- Four legs of the intersection of Estara Avenue / Marguerite Street
- Two legs of the westerly intersection of West Avenue 32 (South Leg) / Fletcher Drive
- One leg of the easterly intersection of West Avenue 32 (North Leg) / Fletcher Drive

As shown previously in *Figure 2*, an existing crossing guard currently assists with student/pedestrian crossing during the morning and afternoon school peak periods at the intersection of Estara Avenue / Fletcher Drive. It is recommended that during construction activities, an additional temporary crossing guard be provided at the West Avenue 32 (South Leg) / Fletcher Drive (westerly intersection) to assist with student/pedestrian crossing since the majority of construction trucks/vehicles are expected to arrive/depart from the Project site via eastbound/westbound Fletcher Drive.

As mentioned previously, the existing pedestrian access to the campus is currently controlled at seven (7) locations which are also expected to be maintained, depending upon the construction phasing activities. After completion of the Project, all existing pedestrian points of entry would remain except for Octavia Gate 3, which serves as the City of Angels Community School entrance along the south side of Fletcher Drive. This entrance would be relocated, as the City of Angels Community School

would be relocated elsewhere on-campus or off-campus. As it is recognized that while there are seven (7) pedestrian gate locations, there are five (5) main pick-up/drop-off zones located on Campus and one Special Education (SPED) bus pick-up/drop-off area on the former Roswell Street on-site parking lot. These gate locations connect to two main pedestrian walking paths across campus, including: 1) the Fletcher Gate (i.e., the pedestrian entrance adjacent to the Vehicular Access 1 driveway) to the pedestrian entrance on Marguerite Street, and 2) the Main Gate (i.e., the pedestrian entrance along the west side of Estara Avenue at the Irving MS main entrance) to the Physical Education Building.

During periods of heavy construction activities with the demolition of the Administration building and construction of the new Administration and Classroom building, the existing Irving MS Main Entrance pedestrian gate on Estara Avenue may need to be closed and pedestrian gate access be consolidated to other pedestrian gates such as the Visitor Entrance gate on Estara Avenue just south of Roswell Street or the pedestrian gate on Marguerite Street.

The following general considerations are recommended to maintain pedestrian access and safety during all phases of construction:

- Notify the general public along with representatives from the schools, student and parent community and other entities in the area to alert them of upcoming changes due to construction and advise them of any efforts being taken to accommodate pedestrian needs, especially if any existing routes are closed or detoured. Display in a visible location near the work site, the contact information of School/construction representatives to pedestrians who want to make inquiries or report problems.
- Provide a safe, convenient travel path for pedestrians during all phases of construction and maintain the pedestrian pathways clear of debris and inspect them on a regular basis.
- Minimize construction vehicle and equipment movements across pedestrian pathways to the extent feasible. Avoid leading pedestrians into conflicts with construction vehicles, equipment, operations, and workers.
- Evaluate adequacy for pedestrian safety and remove any hazards.
- Covered walkways should be provided where pedestrians are exposed to potential injury from falling debris.
- In the event where a sidewalk must be closed, a temporary route should be created along the existing alignment. When it is not possible to create a temporary route, pedestrians must be detoured with advance signs in

accordance with the *California Manual on Uniform Traffic Control Devices* (CA MUTCD).

- Provide at least the minimum required width and smooth surface for wheelchair access. Provide ADA compliant wheelchair ramps where necessitated by elevation changes.
- Provide continuous access to the transit stop provided along the Project frontage on Fletcher Drive and/or relocate transit stop.
- Avoid closing any crosswalks in the Project immediate area especially the crosswalks along Fletcher Drive, Estara Avenue and Marguerite Street.

Emergency Access During Construction Activities

The potential transportation impacts during Project construction have been analyzed as summarized above. Having stated this, emergency vehicle access throughout the study area must be maintained during the construction activities. It is important to note that as required by the State of California Vehicle Code (i.e., specifically Section 21806, Authorized Emergency Vehicles), “upon the immediate approach of an authorized emergency vehicle which is sounding a siren and which has at least one lighted lamp exhibiting red light that is visible, under normal atmospheric conditions, from a distance of 1,000 feet in front of a vehicle, the surrounding traffic shall, except as otherwise directed by a traffic officer, do the following:

- (a) (1) Except as required under paragraph (2), the driver of every other vehicle shall yield the right-of-way and shall immediately drive to the right-hand edge or curb of the highway, clear of any intersection, and thereupon shall stop and remain stopped until the authorized emergency vehicle has passed.
- (2) A person driving a vehicle in an exclusive or preferential use lane shall exit that lane immediately upon determining that the exit can be accomplished with reasonable safety.
- (b) The operator of every street car shall immediately stop the street car, clear of any intersection, and remain stopped until the authorized emergency vehicle has passed.

- (c) All pedestrians upon the highway shall proceed to the nearest curb or place of safety and remain there until the authorized emergency vehicle has passed.”⁴

During the construction of the proposed Project, it is expected that emergency vehicles will continue to utilize the surrounding street system even though some travel lanes along certain portions of some roadways may be temporarily used for construction staging and/or material delivery. If required, drivers of emergency vehicles are also trained to utilize center turn lanes, or travel in opposing through lanes to pass through crowded intersections or streets. Thus, the respect entitled to emergency vehicles and driver training allow emergency vehicles to negotiate typical street conditions in urban areas including areas near any temporary travel lane closure(s).

Construction Management and Haul Route Approval

Approvals required by the City of Los Angeles and the State of California Department of Transportation (Caltrans) for implementation of the proposed Project include a Truck Haul Route program approved by the City and an encroachment permit obtained by Caltrans. With regard to other construction traffic-related issues, construction equipment would be stored within the perimeter fence of the site.

As a general contractor has not yet been selected, the exact extent of the construction work site boundary cannot be determined at this time. The construction contractor will be required to submit a Construction Worksite Traffic Control Plan to the Office of Environmental Health and Safety (OEHS) for review prior to the start of construction activities. Given the number of pedestrians (i.e., guardians and children) walking to/from the campus, it is recommended that certain lanes/sidewalks along Fletcher Drive, Estara Avenue, and Marguerite Street remain open during construction. Should the closure of any lanes/sidewalks be determined to be necessary, appropriate pedestrian detours will be required to be established along with the appropriate advance warning signage directing pedestrians to other available sidewalks and crosswalks/crossings. Should any such pedestrian detours or temporary travel lane closures be proposed, traffic control/management plans will be prepared for the required review and approval by the City of Los Angeles Department of Transportation. In addition, a Construction Staging and Traffic Management Plan (CSTMP) will also be required for review and approval by the City outlining all of the above details.

⁴ Source: State of California Department of Motor Vehicles website; <https://www.dmv.ca.gov/portal/dmv>; Amended Sec. 68, Ch. 1154, Stats 1996 Effective September 30, 1996.

With the required haul route approval and other construction management practices, construction activity impacts would be less than significant. Potential construction traffic impacts can be further reduced with the implementation of the following design features as part of the CSTMP:

- Maintain existing access for school campus and on-site parking facilities;
- Limit any potential roadway lane closures to off-peak travel periods;
- Schedule receipt of construction materials to non-peak travel periods, to the extent possible;
- Coordinate deliveries to reduce the potential of trucks waiting to unload for protracted periods of times; and
- Prohibit parking by construction workers on adjacent residential streets and direct all construction workers to designated on-site parking areas.

City of Los Angeles High Injury Network Review

Vision Zero is a policy which prioritizes the safety of pedestrians and bicyclists on public streets, with the understanding that roads which are safe for vulnerable users will be safer for all users, in an effort to eliminate traffic fatalities. Key elements of the policy, such as reducing traffic speeds, are founded on the principles of engineering, education, enforcement, evaluation, and equity. Originating in Sweden, the policy has been adopted in numerous other North American cities, including California cities such as San Francisco and San Diego.

Former Mayor Eric Garcetti issued Executive Directive No. 10 in August 2015, formally launching the Vision Zero initiative in Los Angeles. Vision Zero is also a stated safety objective in the Mobility Plan 2035, which sets the goal of zero traffic deaths by 2035. Jointly directed by the Department of Transportation and the Police Department, Vision Zero takes a multi-disciplinary approach to identifying safety risk factors and implementing solutions on a citywide scale. Using a methodology originally developed by the San Francisco Public Health Department, the Vision Zero Task Force has identified streets where investments in safety will have the most impact in reducing severe injuries and traffic fatalities in the City⁵. These roads are collectively known as the High Injury Network (HIN). The HIN will be reviewed for potential engineering re-design as well as educational and enforcement campaigns.

⁵ Vision Zero Los Angeles 2015-2025, August 2015.

The proposed Project is located at 3010 Estara Avenue in the Northeast Los Angeles Community Plan Area. The roadways adjacent to and in the vicinity of the Irving MS campus that have been identified on the City's HIN are noted below:

- Fletcher Drive between Glendale Boulevard and Estara Avenue (along Irving MS campus frontage), and
- San Fernando Road between Fierro Street and Macon Street (approximately 0.30-miles from Irving MS campus).

If a proposed project results in significant traffic impacts at intersections located along a designated HIN, LADOT's Vision Zero group will review those specific locations and immediate vicinity for potential safety enhancements that are consistent with the City's Vision Zero initiative.

Conclusions and Recommendations

The following recommendations are based on LLG's review of the current pick-up/drop-off activities associated with usage of the pick-up/drop-off loading zone on Marguerite Street as well as usage of drop-off/pick-up activities on West Avenue 32, Estara Avenue, and Fletcher Drive as it relates specifically to overall circulation patterns:

- i. In accordance with Standard Condition Measures SC-PED-2 and SC-PED-4, it is recommended that the Irving MS institute monitors to help in the loading and unloading of students to/from personal vehicles at the future planned main loading zone along the north side of Marguerite Street between West Avenue 33 and Estara Avenue, as well as the existing secondary loading areas along the south side of Fletcher Drive and along Estara Avenue. In addition to the passenger loading signage, the main Marguerite Street loading zone shall be coned off, marking the appropriate area for guardians to drop-off/pick-up students without leaving the vehicle. This has been observed to result in a more continuous traffic flow and efficient vehicle processing, which in turn reduces the potential for any vehicle queuing outside of the designated loading zone area.
- ii. It is recommended that a minimum of one (1) monitor be stationed near each of the loading areas surrounding the Irving MS campus: 1) near the Marguerite Street main loading area; 2) along the west side of Estara Avenue; 3) south side of Fletcher Drive near the Fletcher Gate. The monitors will be present primarily for the oversight of drop-off/pick-up activities at the designated loading zone and not to assist with any pedestrian crossings. It is recognized that improving the processing of pick-up operations would also

- help relieve congestion/queues observed along Marguerite Street and Estara Avenue. The recommended circulation pattern is intended to facilitate a high processing rate for dropping-off and picking-up students (i.e., unload and load several vehicles at a time). Parents will be encouraged to have their student ready to exit and enter the vehicle quickly and safely.
- iii. It was observed that the monitor stationed at the Vehicular Access 1 driveway and the monitor stationed at Octavia Gate 1 were not easily visible to motorists entering the on-site parking lot and motorists entering the loading zone for Isana Octavia Academy, respectively. It is therefore recommended that monitors wear safety gear including reflective vests, hats and/or gloves at all times when performing traffic control operations at the campus. Also, it should be reiterated that monitors be on time and present prior to the commencement of loading operations.
 - iv. As posted for the loading zone, time-restricted two-hour parking is currently only permitted during the off-peak loading time periods between 9:00 AM and 1:30 PM during school days. In addition, parking is not permitted along the west side of Estara Avenue between 7:00 AM and 5:00 PM on school days, and parking is not permitted along the south side of Marguerite Street and along the east side of Estara Avenue between 12:00 PM and 2:00 PM on Wednesdays. Further enforcement should be implemented such that vehicles observed to be parked within the Marguerite Street loading zone, as well as vehicles parked along the west side of Estara Avenue, during the loading period would be towed/ticketed since any parked vehicle/s during the loading period would essentially block other vehicles from fully utilizing the loading zone and reduces the efficiency of vehicle processing. Guidance on parking restrictions, vehicle enforcement, and school parking signage are provided in the School Traffic Safety Reference Guide REF-4492.1 as part of Standard Condition Measure SC-PED-4.
 - v. Based on the field observations, a crossing guard was observed at the Estara Avenue / Fletcher Drive intersection. It is recommended that the School prepare a circulation and pedestrian routes plan and encourage that guardians and students follow the circulation pattern and utilize the loading areas for those who choose to conduct drop-off/pick-up activities along the Marguerite Street, Estara Avenue, or Fletcher Avenue frontages. Guardians who choose to park or stop along the east side of Estara Avenue and have their child(ren) walk to the Main Gate or Visitor Entrance along the west side of Estara Avenue should be informed by the School that the child(ren) must cross within the designated crosswalks at either Estara Avenue / Fletcher Drive or

Estará Avenue / Marguerite Street and not cross mid-block. Standard Condition Measure SC-PED-2 identifies the OEHS Traffic and Pedestrian Safety Program which includes measures (i.e., sidewalks, crossing guards, crosswalks, warning signs, etc.) to ensure separation between pedestrians and vehicles along pedestrian routes.

- vi. Due to the high level of pedestrian activity from guardians/students who walk to/from campus, it was observed that a significant number of pedestrians crossed Estara Avenue mid-block without use of the designated crosswalks on Estara Avenue. Some pedestrians were also observed to cross Marguerite Street without use of the designated crosswalks on Marguerite Street. In accordance with Standard Condition Measure SC-PED-2, it is recommended that “No Ped X-ing” signs be installed facing both the northbound and southbound directions mid-block on Estara Avenue and that pedestrians be re-directed to continue north/south in order to cross Estara Avenue at the designated crosswalks at Fletcher Drive or Marguerite Street. It is also recommended that “No Ped X-ing” signs be installed facing both the eastbound and westbound directions on Marguerite Street (between West Avenue 33 and Estara Avenue) and that pedestrians be re-directed to continue east/west in order to cross Marguerite Street at the designated crosswalks at West Avenue 33 or Estara Avenue.
- vii. School-operated buses which transport students to/from Irving MS shall load and unload students along the east side of West Avenue 32 during the morning and afternoon loading time periods. Only the school-operated bus for Special Education students shall enter the site using the Vehicular Access 2 driveway along the south side of Fletcher Drive and use the on-site parking lot to load and unload students during the morning and afternoon loading time periods.
- viii. Based on information provided in the Initial Study, the sidewalk along the east side of West Avenue 32 was observed to be four feet wide and in poor condition. In accordance with Standard Condition SC-PED-3, it is recommended that substandard sidewalks along the Irving MS campus frontages be improved to a minimum of eight feet wide to ensure safety between pedestrians using the sidewalks and vehicles using the adjacent roadways. In addition, the Initial Study noted that the Vehicular Access 1 driveway on the west side of Estara Avenue does not provide an ADA-accessible path for pedestrians. It is therefore recommended that the Vehicular Access 1 driveway be improved with an ADA-accessible sidewalk entry or curb ramps.

- ix. Based on the field observations, much of the posted signage (i.e., parking restriction/passenger loading signage, etc.) along the Irving MS campus frontages had low visibility due to street trees covering the signs. It is recommended that the street trees/landscaping along the campus frontages within the public right-of-way be trimmed and maintained to ensure posted signage is clearly visible and properly enforced. In addition, any new street trees or streetscape plantings should be introduced along the campus frontages within the public right-of-way in accordance with the City's standards.

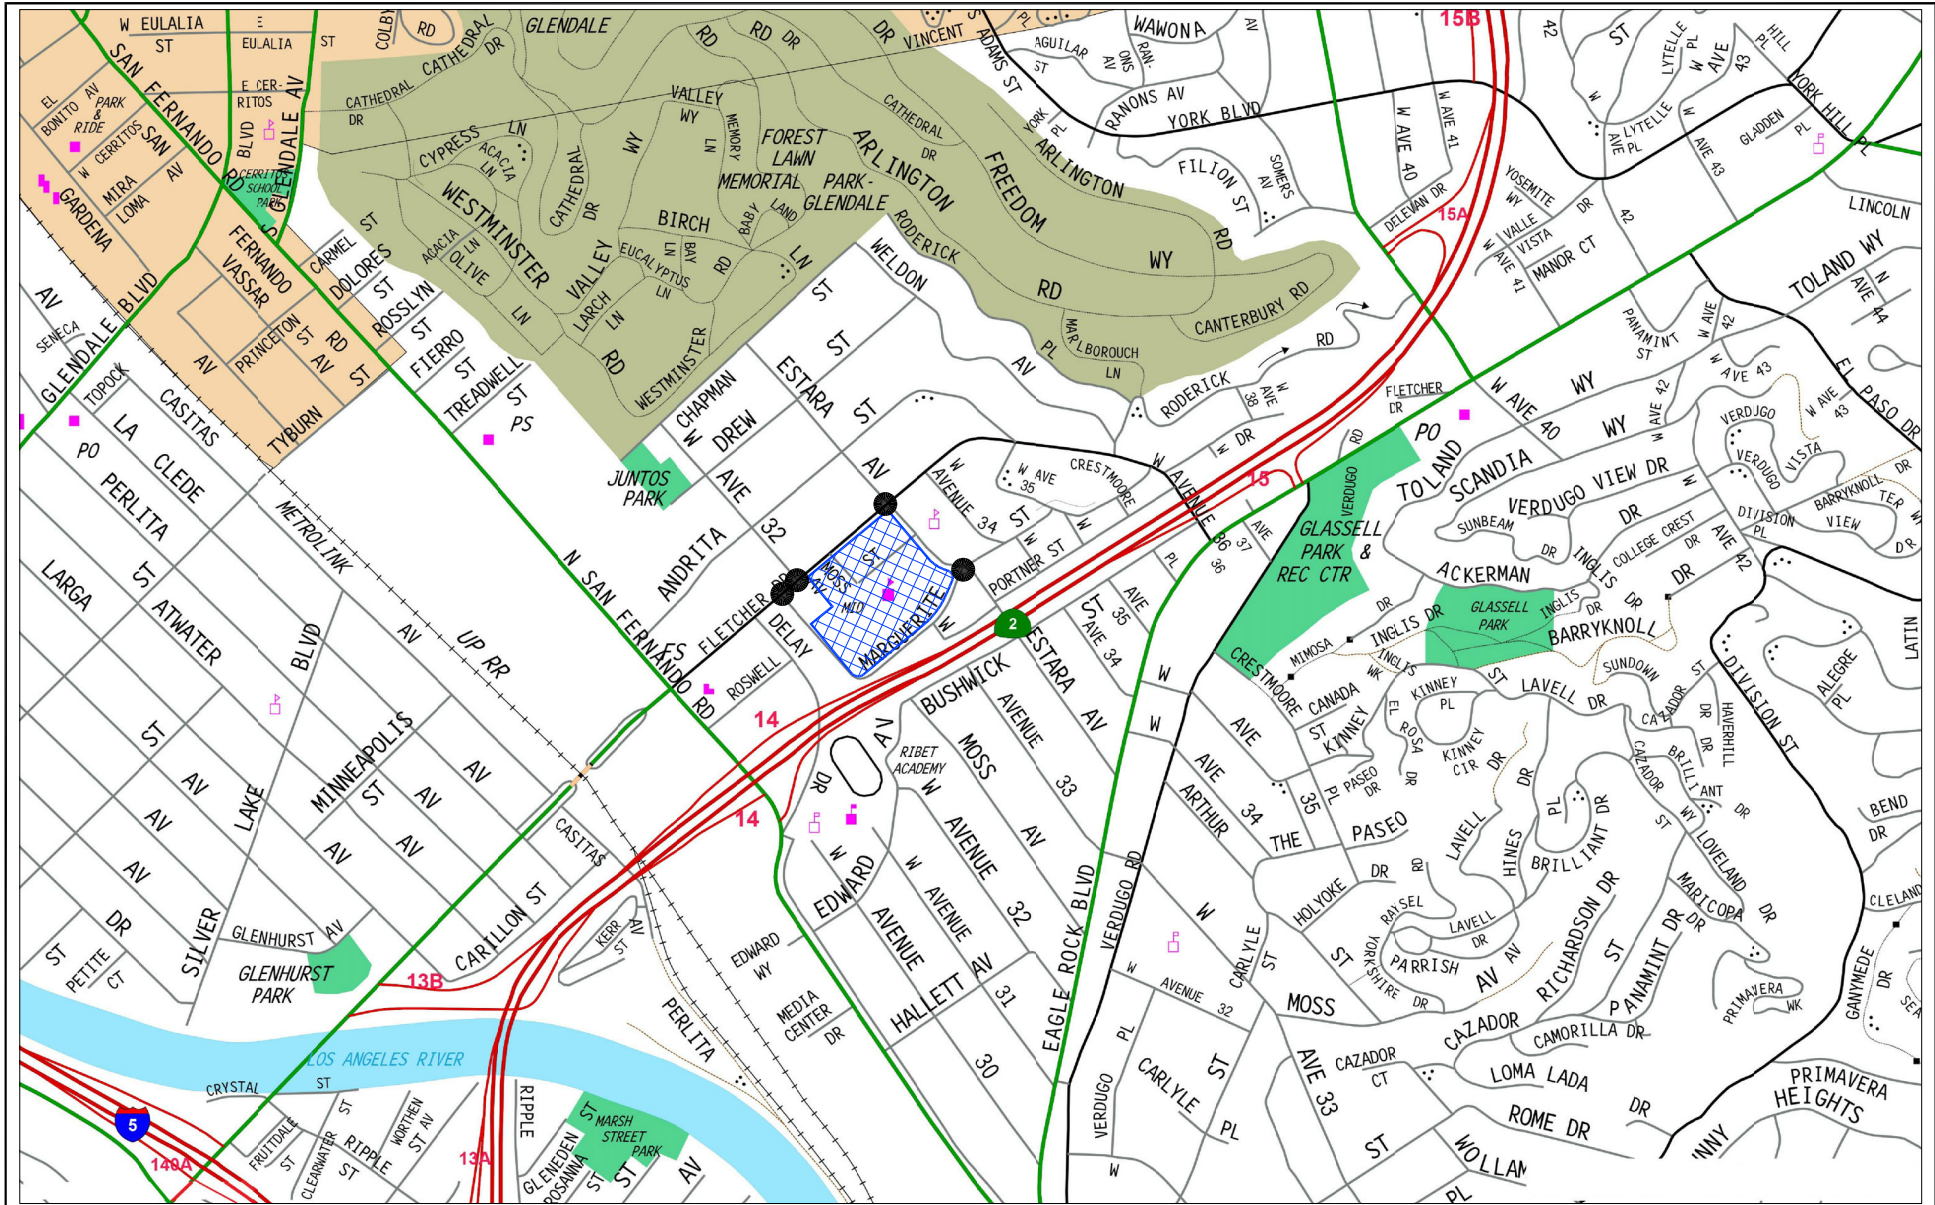

Recommendations on General Campus Traffic Procedures

It is also recommended that the student drop-off/pick-up operations be included in the School policies for parent/guardian distribution at the beginning of each school year during the student enrollment period. The School's policy would include general traffic procedures for the campus, a summary of the drop-off and pick-up procedures, reminders on School policies for off-campus traffic circulation and parking, as well as provisions for being a good neighbor to local residents living near the School campus. These School policies are communicated to faculty, staff, students and parents/guardians at the beginning of the school year and are reinforced throughout the school year in the School's newsletter that is distributed throughout the School community, as well as to every resident located within a 500-foot radius of the campus.

It is also recommended that a School official (i.e., the School Principal or Principal's designee) along with their respective contact information, including telephone number, continue to be published in the School's newsletter as well as posted on the School's website so that if the community has questions or comments regarding school-related traffic and parking issues, there is one clearly identified contact person. This School official would be referred to as the School's traffic and parking ombudsman and would be responsible for proactively addressing questions, comments and complaints from the School community and local residents. It is expected that the School's traffic and parking ombudsman would be very familiar with all policies and procedures regarding traffic and parking operations at the campus, as well as any construction activities or special events planned to be held at the campus.

Please feel free to call us at 626.796.2322 with any questions and comments.

Existing Irving Middle School Campus Trip Generation							
Middle/Junior High School [8] 640 students	1,344	232	197	429	46	50	96
Total Existing Campus Trip Generation	1,344	232	197	429	46	50	96

[1] Source: Based on the construction info provided by LAUSD for other comparable campuses, the following is assumed:

Haul trips expected to average 35 truck trips per day during the Site Preparation phase of peak export activities.

Hours of Truck Hauling Operations: Mondays to Fridays, 9:00 AM to 5:00 PM (8 hours of hauling per day are assumed)

[2] Trips are one-way traffic movements, entering or leaving.

[3] An average of 50 construction workers are expected to be on-site when students are present during the regular school year. Workers are assumed to arrive at the site prior to 7:00 AM and it is assumed that 50 percent (one-half) of the workers would depart during the PM peak hour of adjacent street traffic.

An average vehicle ridership factor of 1.135 passengers/vehicles was applied to determine the worker vehicle trips.

Daily construction worker trips = 50 workers/ (1.135 passengers/vehicle) = 44 inbound vehicle trips + 44 outbound vehicle trips = 88 total daily vehicle trips

[4] Daily truck trips to/from the receptor site/s were derived based on the following, using 14 cubic yard (cy) capacity per haul truck:

35 total truck loads per day = 35 inbound trips + 35 outbound trips = 70 total daily truck trips.

Peak Hour Truck Trips = 70 trips / 8 hours = 8 one-way truck trips per hour.

Thus, for analysis purposes 4 inbound truck trips + 4 outbound truck trips = 8 total truck trips per hour have been assumed.

[5] Peak delivery trips are expected during the Building Construction phase of construction activities, where 24 one-way delivery truck trips are expected during the peak day.

12 inbound delivery trucks + 12 outbound delivery trucks = 24 total daily delivery truck trips (assumed for peak delivery day)

[6] A passenger car equivalency (PCE) factor of 2.5 was employed for analysis purposes. This accounts for the assumption that a single 14 cubic yard capacity haul truck has the same overall affect on intersection traffic operations as 2.5 passenger cars.

Peak Hour Adjusted Truck Trips (in PCEs) = 10 inbound truck trips + 10 outbound truck trips = 20 total truck trips (in PCEs) have been assumed.

[7] A PCE factor of 2.0 was employed for delivery trucks, and the adjusted daily and peak hour delivery truck trips (in PCEs) are as follows:

Daily Adjusted Delivery Trips (in PCEs) = 24 inbound delivery trips + 24 outbound delivery trips = 48 total daily delivery trips.

Peak Hour Adjusted Delivery Trips (in PCEs) = 4 inbound delivery trips + 4 outbound delivery trips = 8 total delivery trips.

[8] Source: ITE "Trip Generation Manual", 11th Edition, 2021.

ITE Land Use Code 522 (Middle School/Junior High School) trip generation average rates.

- Daily Trip Rate: 2.1 trips/student; 50% inbound/50% outbound

- AM Peak Hour Trip Rate: 0.67 trips/student; 54% inbound/46% outbound

- PM Peak Hour Trip Rate: 0.15 trips/student; 48% inbound/52% outbound

A. ARCHITECTURAL

Introduction

This report examines the feasibility of retaining the existing Administration Building that lies on an active fault zone at LAUSD Irving STEAM Magnet Middle School. Included are two options. Option 1 retains the entirety of the Administration Building. Option 2 explores demolishing the portion of the building on the fault zone and retaining the portion of the existing Administration building that is not on the fault. This report discusses the architectural, programmatic, historic, structural and cost considerations and challenges for these two options.

The California Administrative Code (CAC) outlines the regulations of any structure falling within fifty feet of a seismic fault zone. Per a meeting with Doug Humphrey - LA Regional Manager for the Division of the State Architect, on 08/19/22, a voluntary seismic retrofit of the Administrative Building is allowable. However, it must comply with CAC Section 4-309(c)1, which indicates that the cost of the voluntary seismic retrofit is included in the 50% replacement cost of the value of the existing building. This means that the total cost of the construction (seismic retrofit, paint, finish upgrades, technology upgrades, ADA upgrades that do not impact more than 10% of the structural system, moving interior partitions, etc.) would need to be under 50% of the value of the building (40% at DSA submission) for the structural retrofit to be viable.

When a building is not located in a seismic fault zone, the code allows the costs associated with the structural seismic work to be excluded from the building replacement value. These costs include items such as: demolition required for the structural retrofit, replacement of the roofing system where it is required to construct the seismic rehabilitation, associated air-conditioning equipment and insulation costs, demolition and replacement of seismically vulnerable interior partitions and ceilings/soffits, demolition and replacement of electrical lighting systems, low voltage systems, and equipment connections that are associated with the seismic retrofit.

Based on general assumptions without having formal design documents, we would anticipate the cost of a new classroom building to be approximately \$846 per square foot, whereas a seismic retrofit of the existing building alone, not including other improvements, would cost approximately \$492 per square foot. The seismic retrofit cost alone would exceed the 50% replacement value. When other project costs that are not related to the seismic retrofit (ADA improvements, updated fire alarm system, plumbing system replacement, finish replacements, etc.) are combined with the costs associated with the seismic retrofit, it will add approximately 15-35% more to the cost of construction. This will increase the cost of the alteration, further exceed the 50% replacement value and will preclude the possibility of preserving the existing building.

Option 1

Option 1 studies retaining the entirety of the existing Administration building. Structurally, this would likely mean extensive foundation work under the portion of the building that falls within the “No Construction Zone” of the fault. Architecturally, the main obstacle is the substandard existing classroom sizes.

The existing layout of the Administration Building fails to align with the current educational standards of the district. The building contains 25 classrooms. Of this, four meet the square footage requirements of the district (960 square feet for general classrooms, and 1300 square feet for science and specialty classrooms). 15 are significantly undersized and range from 801 to 1040 square feet. Six are severely undersized and range from 730 to 799 square feet. Only a small fraction of the existing classrooms meets the square footage requirements. There is a significant disparity between available teaching space and educational needs.

The existing interior partitions would need to be demolished and rebuilt to address this issue. For this, the district would need to opt to do the voluntary seismic retrofit. However, even if this is possible, the portion of the building over the “No Construction Zone” at the fault would require extensive foundation work.

Multiple existing building systems are nearing the end of their lifespan or do not meet the district’s current standards. If this building is to remain, there are many recommended upgrades to these existing building systems, such as: replacement of plumbing fixtures (flow rates are not compliant with current code), replacement of HVAC equipment, recertification of fire sprinkler system, replacement of data cabling, replacement of clock/bell system, replacement of PA system, and upgrade to telephone system.

As a STEAM magnet school, Irving attracts students from diverse backgrounds, drawn by its project-based learning in science, math, and technology. However, the inadequacy of the existing classrooms poses a significant obstacle to delivering an equitable education experience. Not a single classroom in the existing Administration Building meets the minimum square footage standard of 1300 square feet, essential for accommodating specialized learning environments such as science labs and specialty classrooms.

Option 2

Option 2 proposes demolishing the segment of the Administration Building situated within the “No Construction Zone” of the fault while preserving the portion outside of it. See Figure 5 on sheet S.5 for reference. Please note that DSA will not permit the remaining portion of the building to be voluntarily upgraded, as it reduces the lateral force system by more than 10% (see meeting minutes dated 03/28/24). Regardless, we have examined this scenario and it presents aesthetic, pragmatic, and structural challenges that undermine its feasibility.

Designed in 1936, the Administration Building stands as one of the original campus structures, exemplifying the PWA Moderne architectural style. Its distinct features include horizontal lines, a rhythmic facade, symmetry, and a central entry point. However, accommodating the school’s program within the remaining space proves problematic. The area available for development of a new building on the campus is approximately 38,000 square feet (see “Development Area #1 on A.6). The preserved section of the Administration Building occupies 26,000 square feet of this, leaving only 12,000 square feet for new construction.

The remaining programmatic needs that do not fit in the portion of the Administration Building to remain encompass eight classrooms, a library, and administrative spaces. These spaces total 36,000 square feet and far exceed the remaining available space to build. Consequently, any new addition must be at least three stories high, significantly overshadowing the preserved portion of the Administration Building. This would disrupt its historic character, transforming it from a focal point of the campus to a mere appendage of the taller, modern addition.

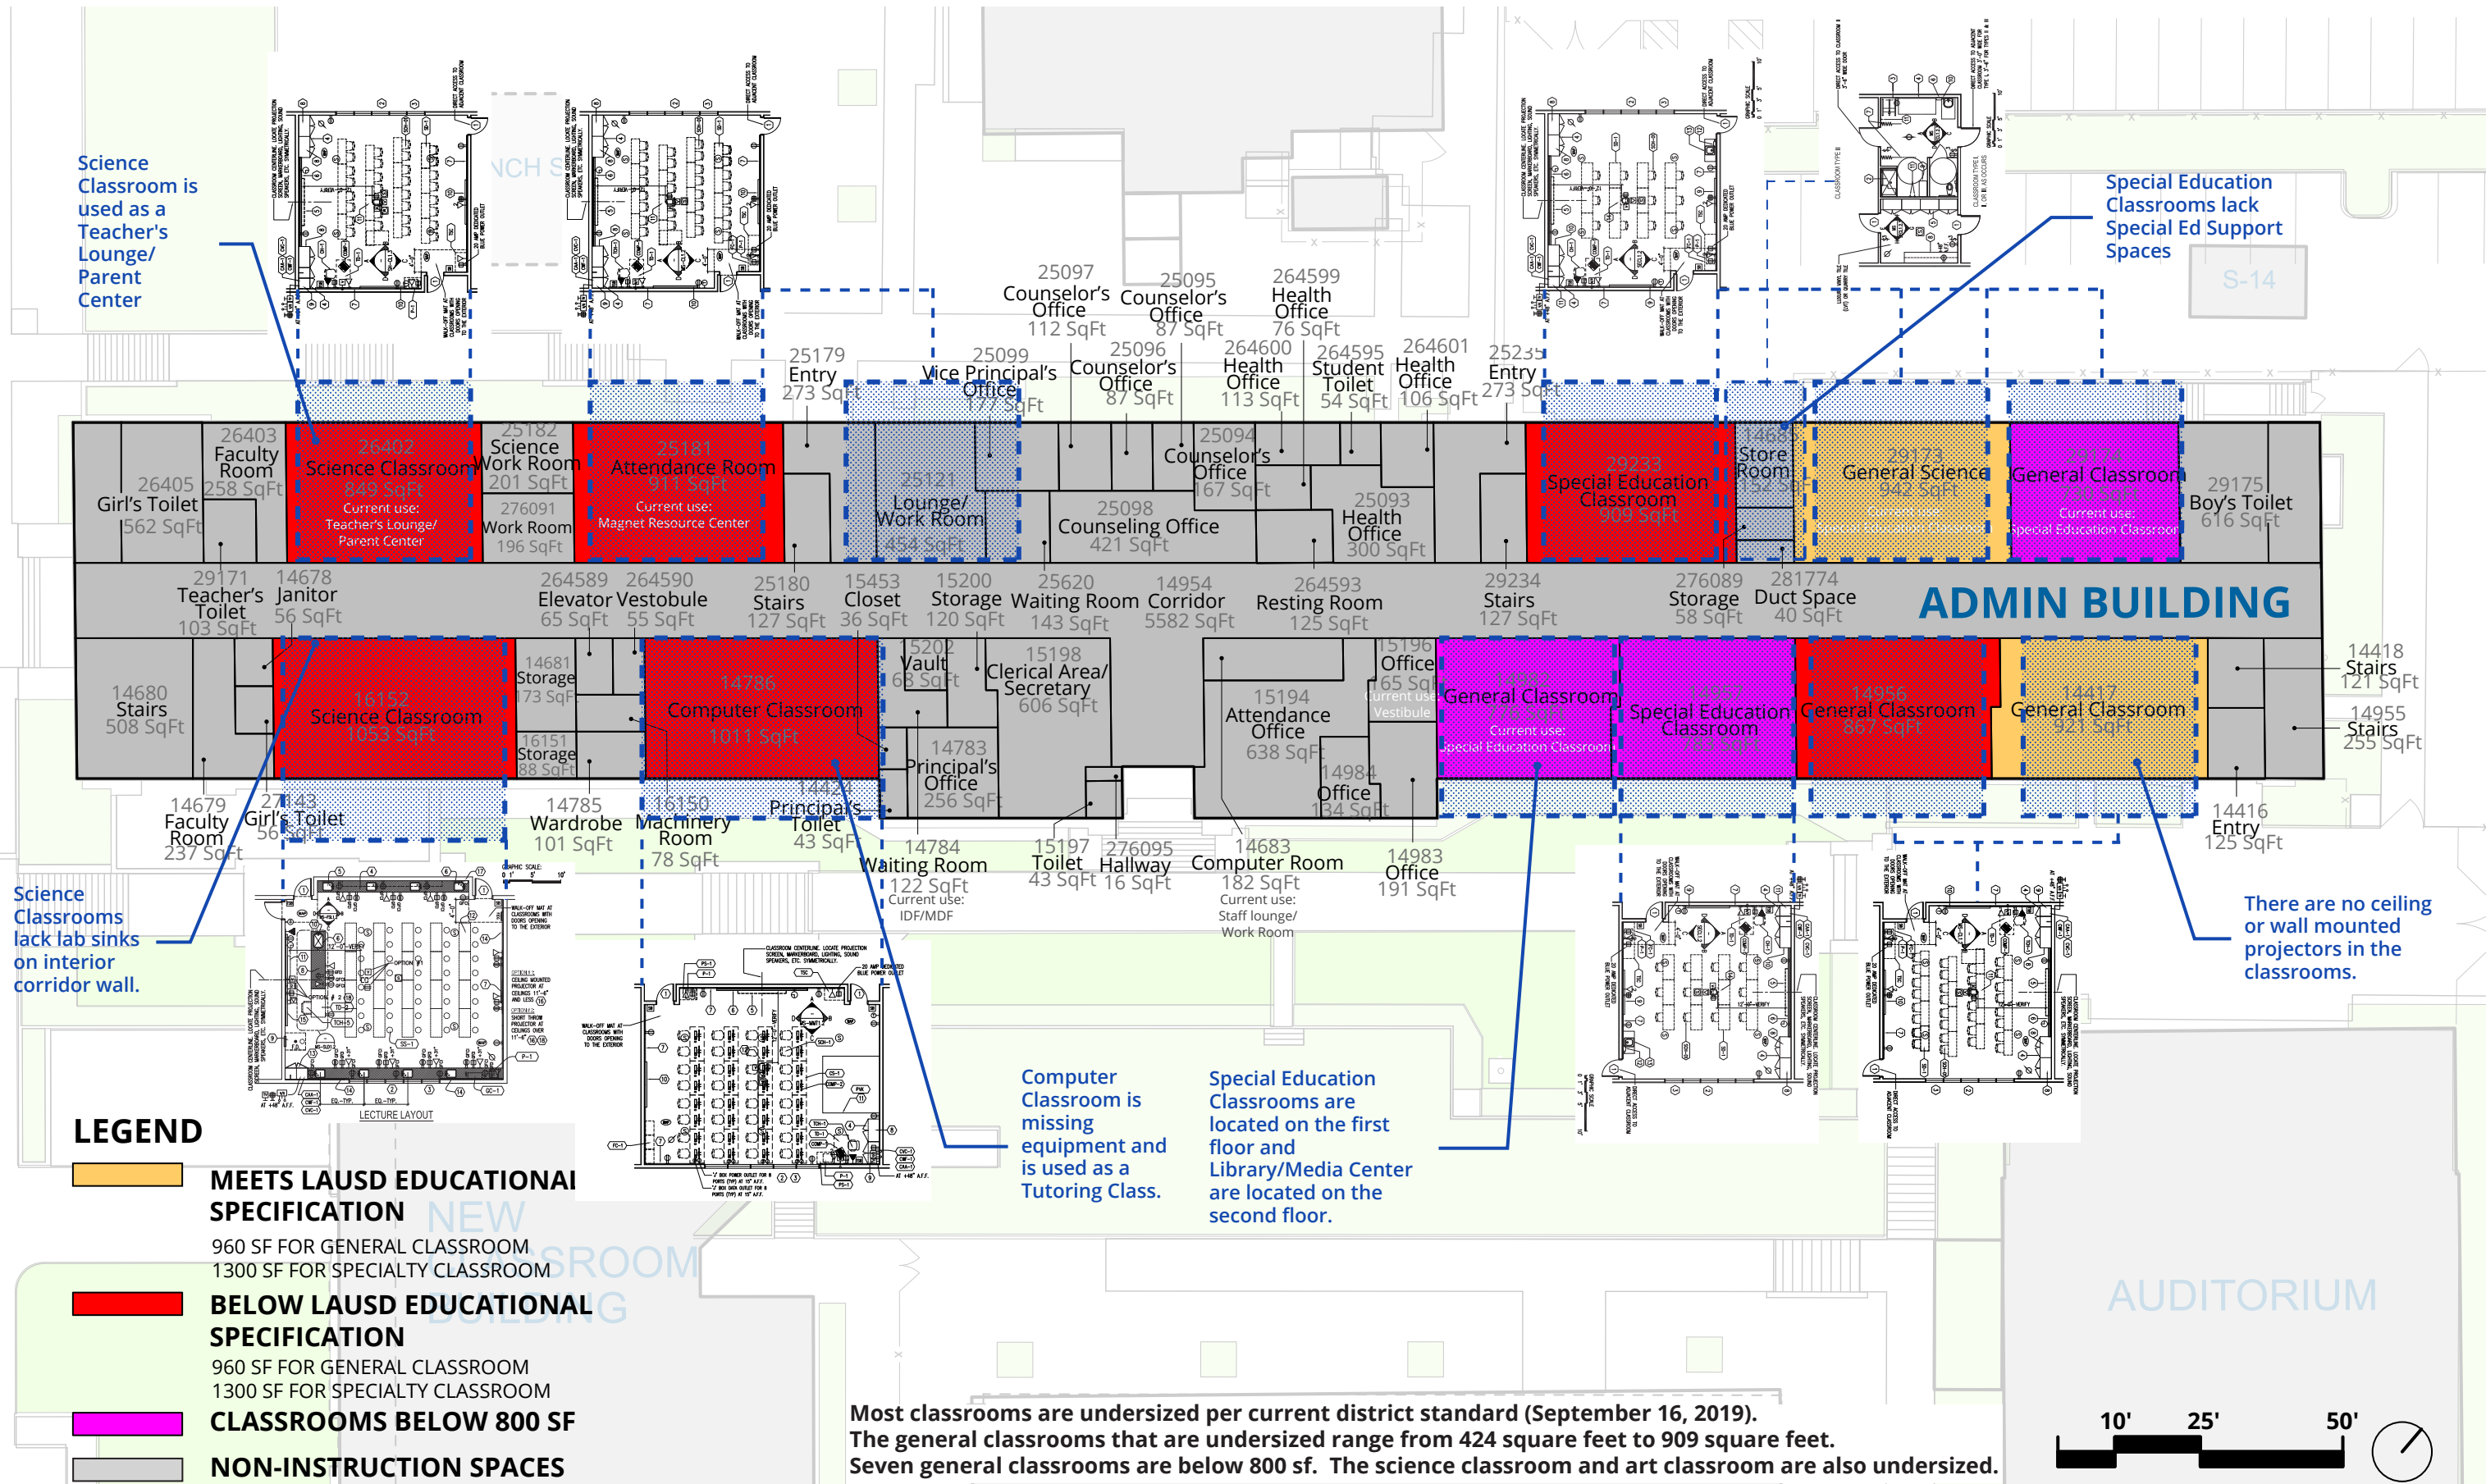

The basement area of the existing area of the building to be demolished is a hub for multiple building systems that serve the campus. The main water service to the campus is here, along with distributions to the other buildings on campus, and the main sanitary lines. The main electrical distribution boards feeding the building are located here. The main telephone board, television distribution, alarm controller, clock controller and fire alarm controller are also here. There would be extensive scope and costs involved to replace and relocate these systems.

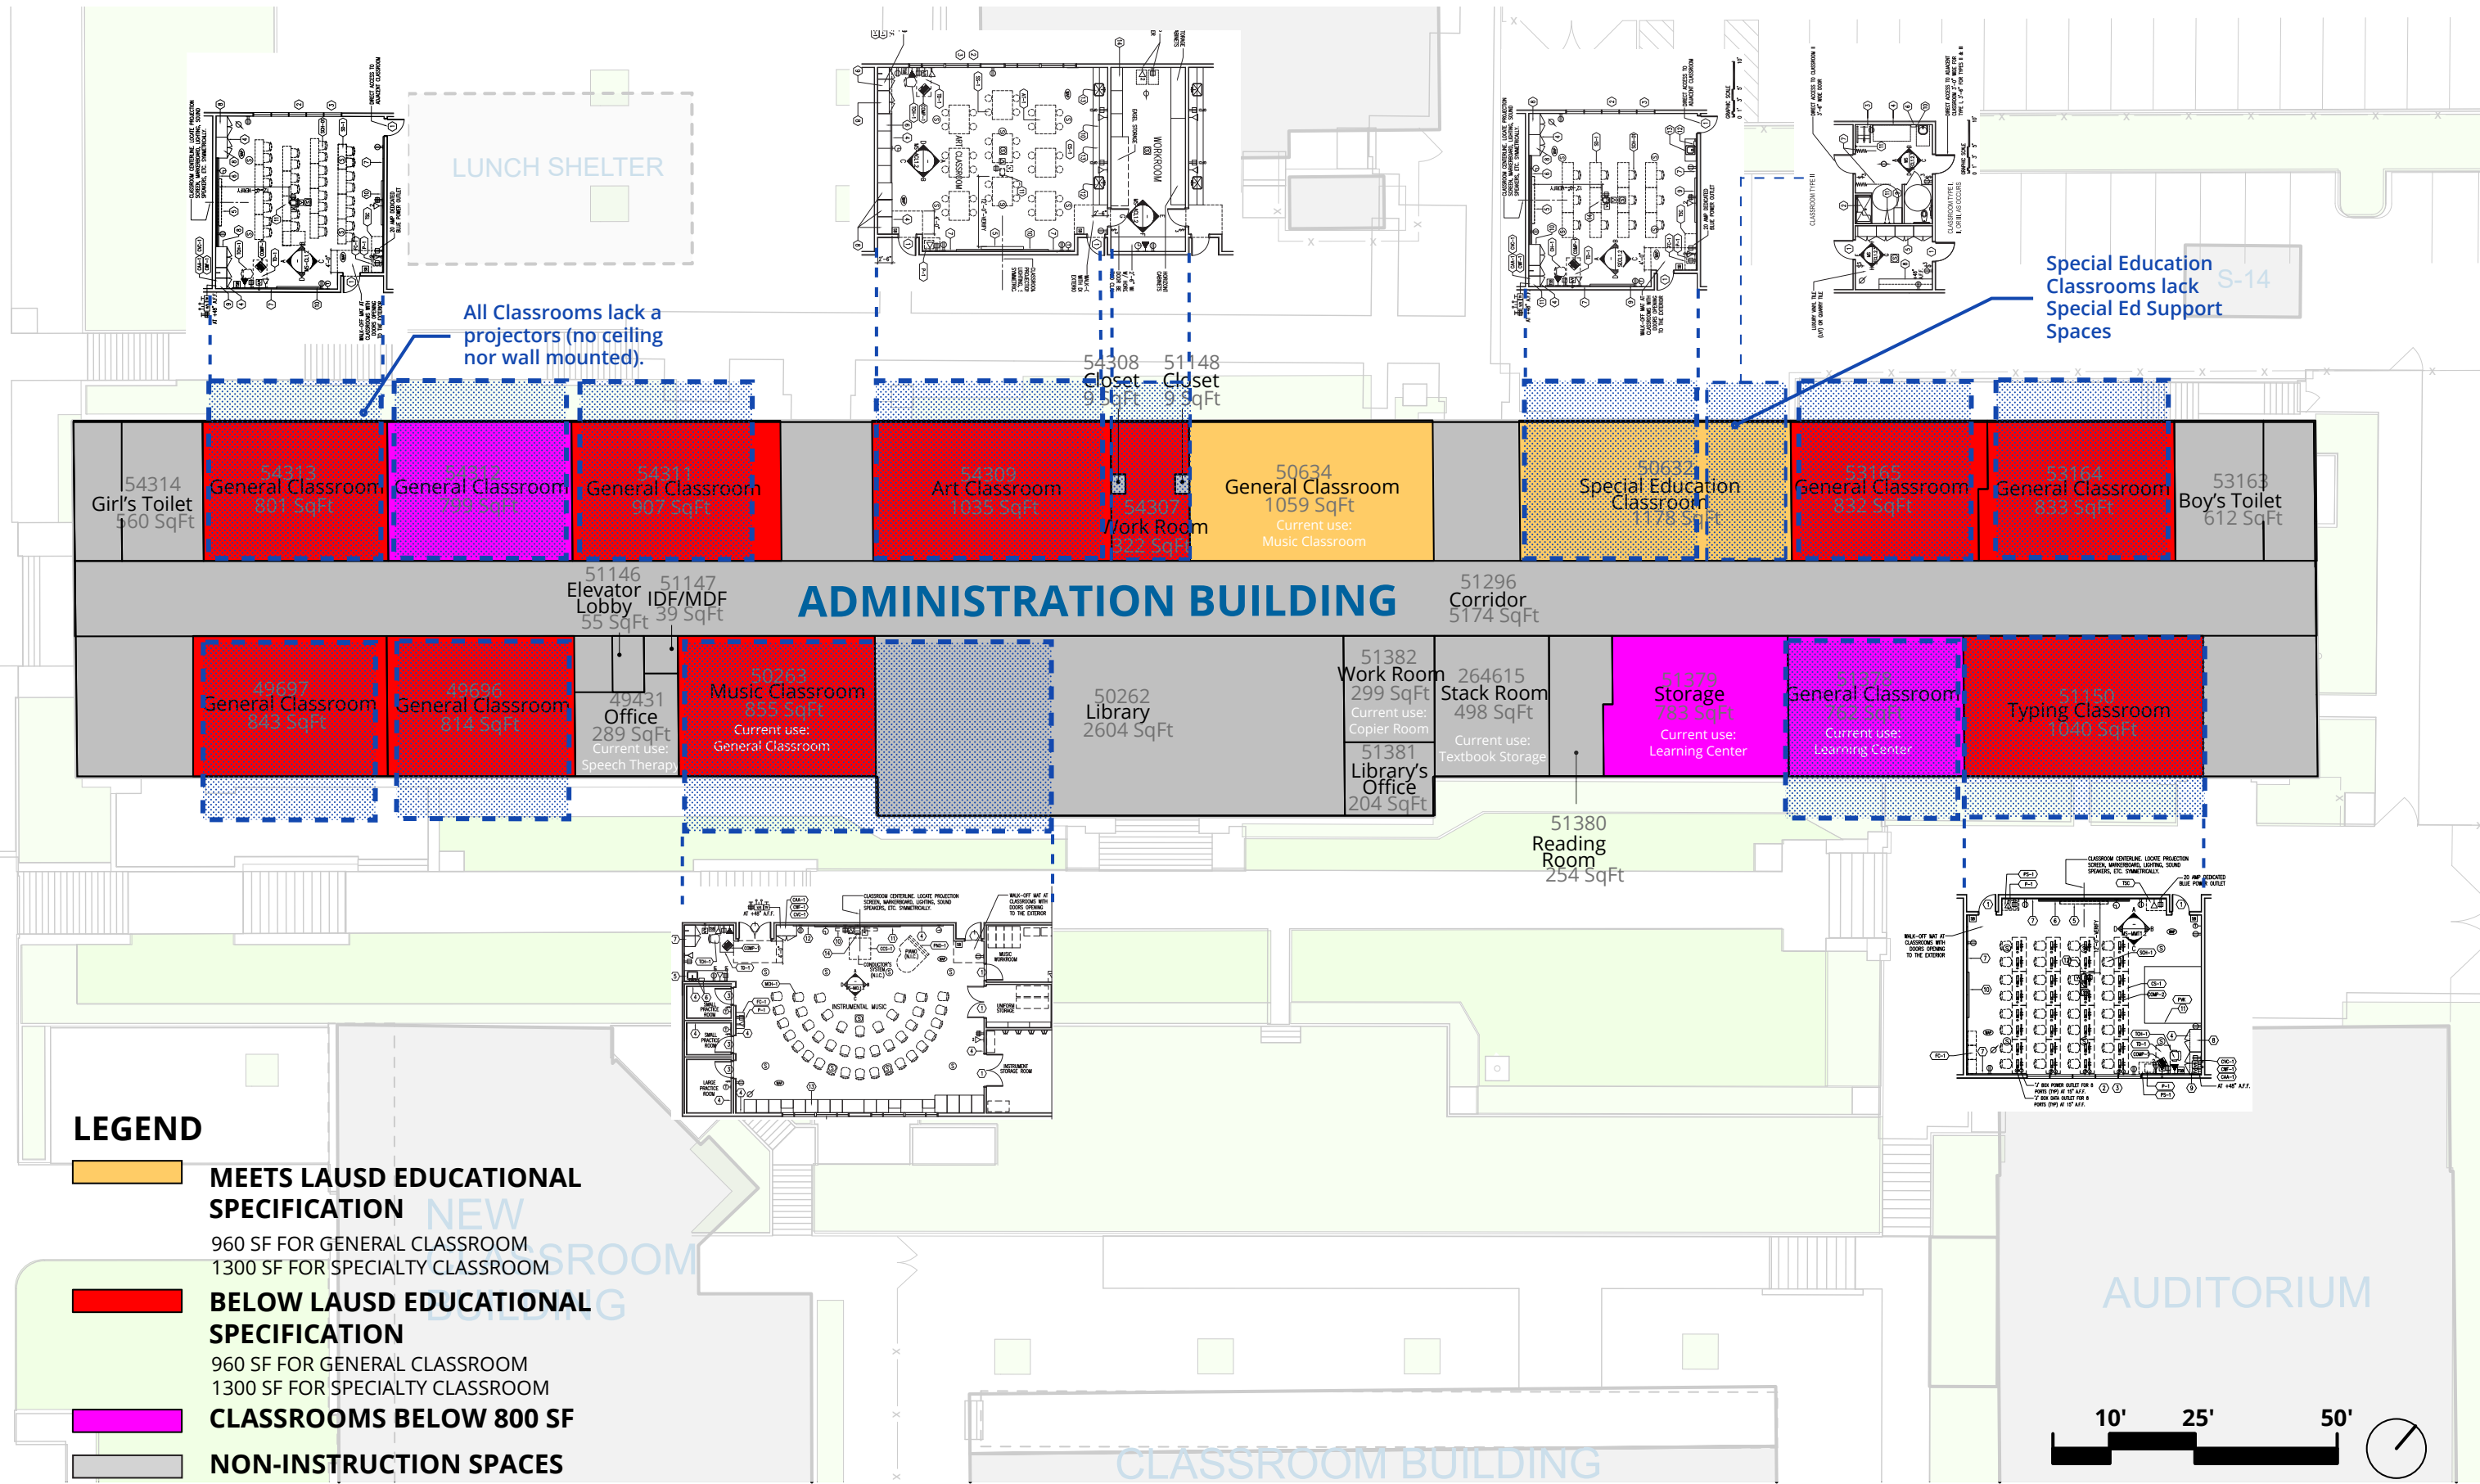

Both the existing elevator as well as the girl’s restrooms are in area to be demolished. These would need to be relocated. The existing HVAC equipment and routing in the existing portion to remain would require significant relocation and rerouting.

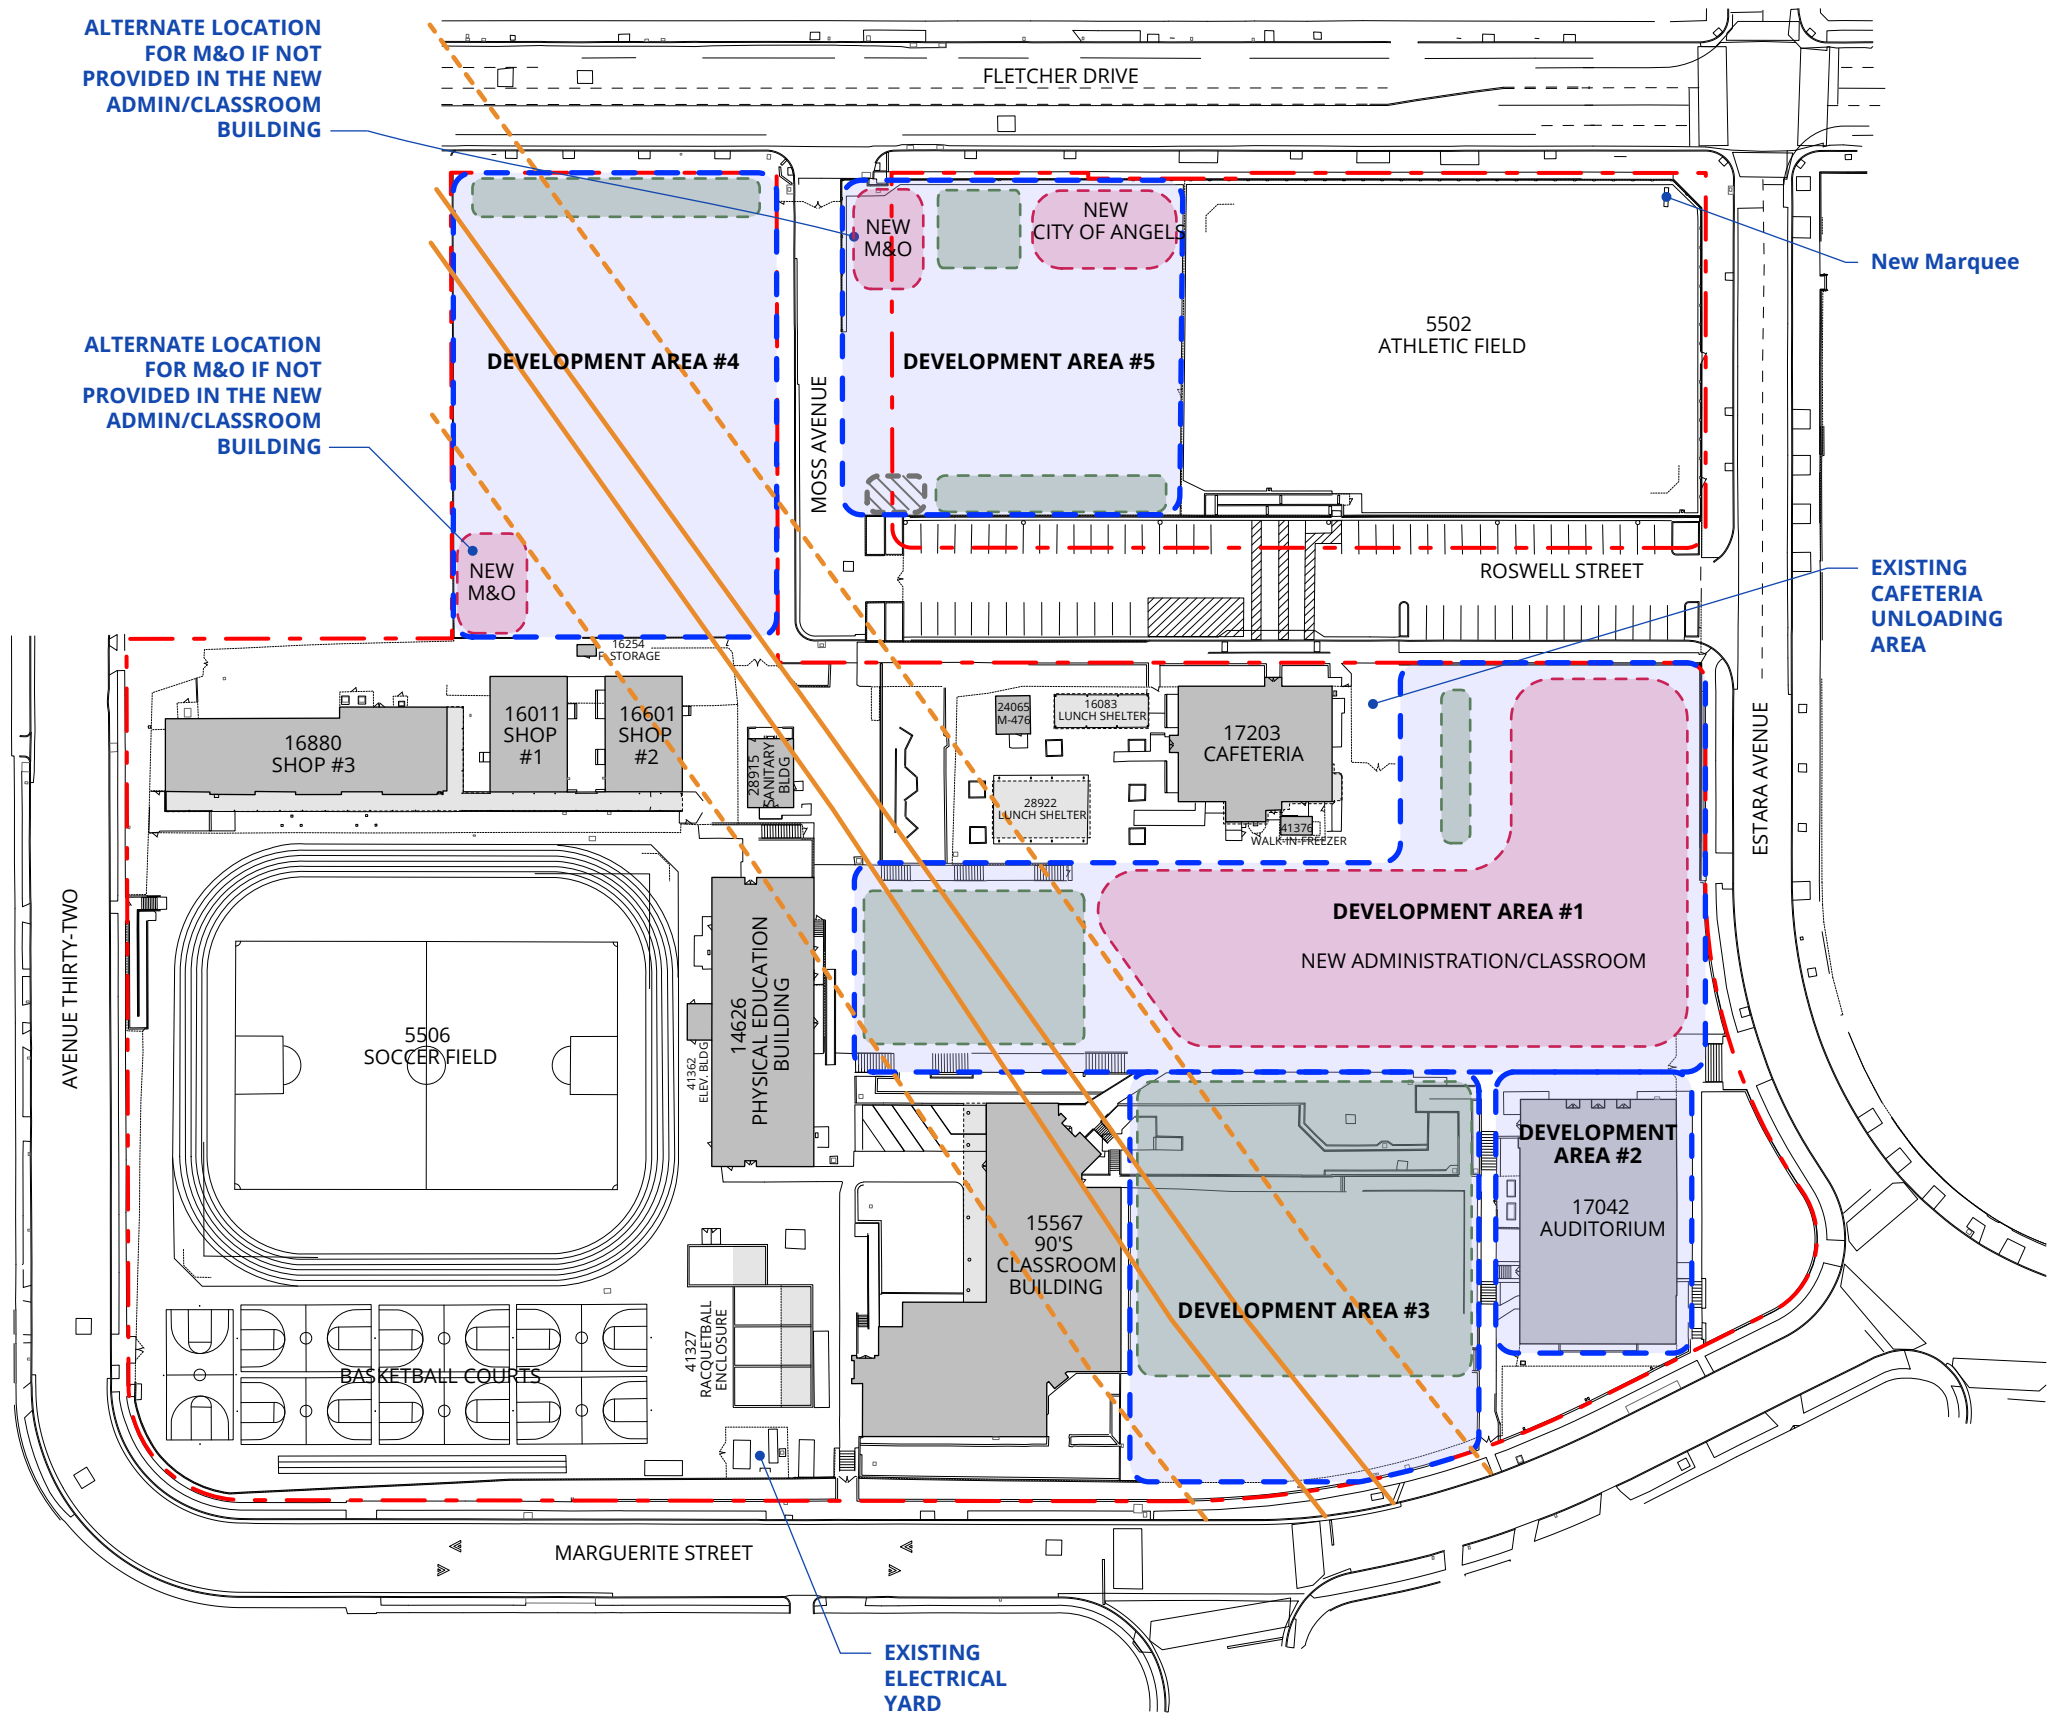

The portion of the building to remain would require extensive structural improvement. Page S.6 figure 5 illustrates that more shear walls will need to be provided in the portion of the building that is to remain. There is also new foundation work associated with these shear walls. Of note, a quarter of the

existing windows on this portion of the building will need to be infilled. This further undermines the historic integrity of the building while also creating suboptimal daylight conditions for the classrooms. It will also add significant cost to the project.

1. Introduction

According to the Geo-Technical report by RMA, dated February 15, 2022, and revised March 23, 2023, a significant portion of the Administration Building falls over a seismic fault zone. The Los Angeles Unified School District (LAUSD) has sought additional assistance to facilitate their compliance with the California Environmental Quality Act (CEQA) process, particularly concerning the proposed removal of the Administration Building located within a Historic District. To address CEQA requirements comprehensively, our office has evaluated the following two structural options:

- **Option 1:** Keep the Entire Administration Building.
- **Option 2:** Keep only the portion of the Administration Building not on the fault.

A brief description of the structure is provided, followed by the two options and structural recommendations.

2. Structure Description

The existing Administration Building is a two-story, cast-in-place concrete structure generally rectangular in plan designed in 1936. There are three segments in this 391'-0" x 64'-6" building: a south section about 139'-2" x 64'-6", a center section about 98'-0" x 71'-8", and a north section about 153'-10" x 64'-6". These building sections are separated by 2" wide seismic joints (see Figure 1 below). These joints are located such that there are two transverse concrete walls remaining in the center portion of the building.

Figure 1: Second Floor Plan & Seismic Joints

There is a crawl space below the first floor varying in height from about 7' to 23' due to the site sloping down from the center to the south and to the north, thus there are actually three framed levels. Story heights from first to second and second to roof are 14'-6" and about 15', respectively. Gravity framing for all the levels consists of 3" cast-in-place reinforced concrete floor slabs and 14" pans forming 5 1/2" wide x 17" deep pan joists spanning between 12" wide x 36" deep reinforced concrete beams. All horizontal framing loads are carried down to foundations through 14" square reinforced concrete columns, 8" thick reinforced interior concrete walls, and 12" thick reinforced exterior concrete walls. Foundations are conventional continuous reinforced concrete strip footings.

Lateral loads due to wind or seismic event are resisted by reinforced concrete shear walls in each principal direction. Transverse walls running east-west are about 25' long and are well distributed across the building segments. Longitudinal walls are short concrete wall piers about 5' to 10' long located along the east and west perimeters of the building. There is an active earthquake fault running across the site that runs partially under this building.

Figure 2: Site Geological Map from the Geological Report by RMA shows the location of the Administration Building relative to the active fault, highlighted in diagonal red hatch.

Figure 3: As-Built Structural Plan illustrates the "Fault Zone" and "No Construction Zone" in relation to the seismic joints, detailing the building's layout and seismic joints. The seismic joints are designated as Seismic Joint "1" and Seismic Joint "2", and the sections of the building separated by these joints are labeled as "A", "B", and "C", all for discussion purposes, as indicated in Figure 3.

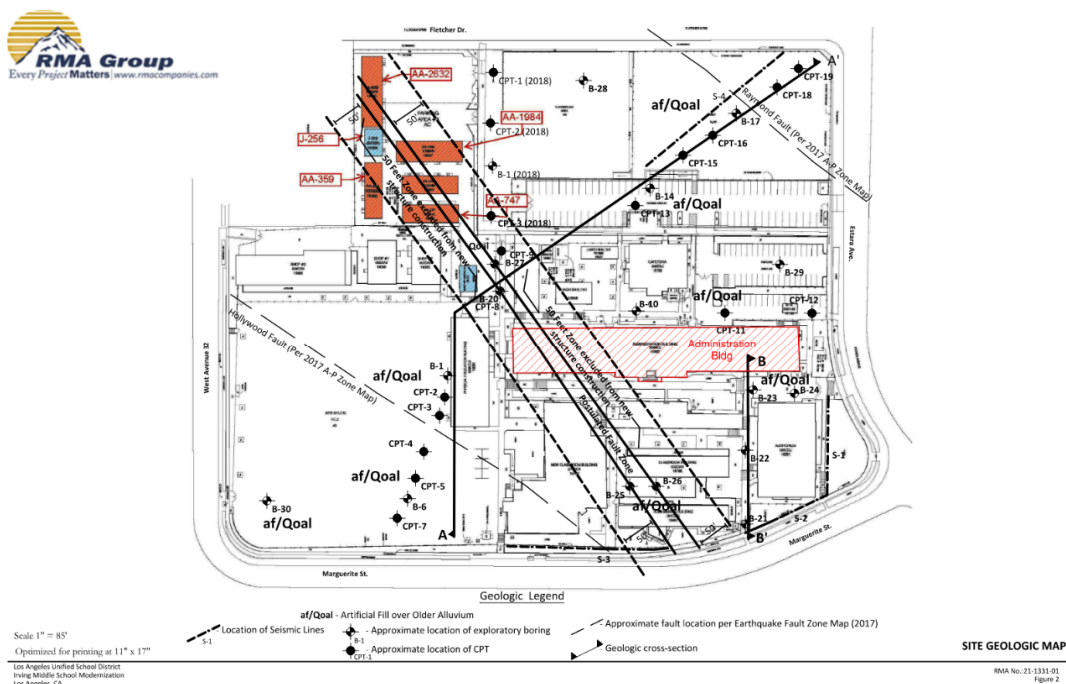

Figure 2. Site Geologic Map from Geological Report

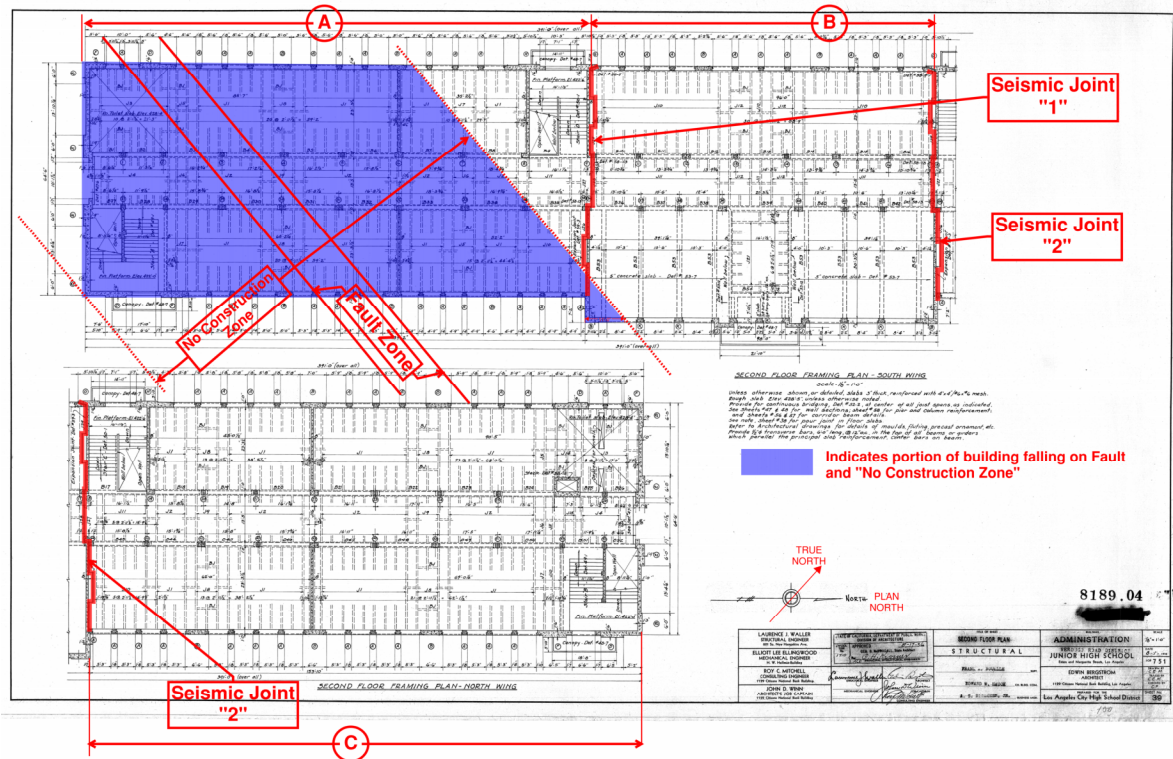

Figure 3. Administration Building plan showing Fault Zone and No Construction Zone

3. Options

Two separate options discuss the feasibility of retrofitting the building or part of the building due to the location of the existing fault line and will also address ASCE 41 Tier 1 deficiencies noted in the 2022 report by John A. Martin & Associates, Inc.

A. Option 1: Keep the Entire Administration Building

The majority of Section “A” and a small part of the middle Section “B” of the Administration Building rest in the 50-foot-wide zone adjacent to an active fault zone where it is likely there will be ground rupture during a major earthquake. Ground rupture is likely to severely damage the structure south of the southernmost Seismic Joint.

The ASCE 41 Tier 1 checklist indicates that a Tier 2 analysis is required if the building does not comply with the surface fault rupture standards (refer to Figure 3). Maintaining the entire structure, including the segment above the fault, necessitates an upgrade to current code standards, which, according to ASCE 41, should be addressed through a comprehensive Tier 3 analysis (refer to Figure 4).

<p>C NC U NA Critical Item</p>	<p>SURFACE FAULT RUPTURE: Surface fault rupture and surface displacement at the building site is not anticipated.</p> <p><i>If the Tier 1 indication is NC or U, complete a Tier 2 check per ASCE 31 section 4.7.1.3 to confirm or revise. Describe the Tier 2 check here and in Appendices A.1 and/or A.2 as necessary.</i></p> <p><i>The Tier 2 check shall include a structural analysis demonstrating high potential for local or global collapse in the evaluation earthquake as a result of the surface rupture. The structural analysis shall consider the displacements imposed on the structure and shall be based on a CGS approved geologic hazard report in accordance with the Appendix in DSA Procedure 08-03.</i></p> <p><i>Geotechnical report states: "probability for surface rupture is moderate" Building on the fault.</i></p>
---	---

Figure 3. ASCE 41 Tier 1 checklist for surface fault rupture

5.4.3.1 Geologic Site Hazards. No Tier 2 evaluation procedure is available for buildings subjected to liquefaction, slope failure, or surface fault rupture. The structure shall be evaluated for the effects of these hazards using the Tier 3 procedures in Chapters 6 and 8.

Figure 4. ASCE41, §5.4.3.1

While ASCE 41 guides further analyses in the presence of specific geologic hazards like fault rupture, it does not provide specific design directions that align with those in the California Building Code. Consequently, the design process will require extensive engineering judgment and robust negotiations with the Division of the State Architect (DSA) to accept such decisions - a process known for its complexities and stringent requirements.

During the virtual call with the DSA on 8/19/22, the DSA provided following clarification related to the issue of "Alterations," e.g., voluntary seismic retrofit, new fire alarm, HVAC replacement, ADA improvements, etc., in existing buildings that are located in a fault hazard zone.

- *A voluntary seismic retrofit of an existing building is allowed, but it must comply with the California Administrative Code (CAC), Section 4-309(c)1. This section indicates that if a structure is located in a fault hazard zone, the costs of the voluntary lateral force-resisting modifications (Alterations) are to be included (contributing) towards the 50% replacement cost of the value of the existing building.*

Below are relevant code sections along with comments provided by the DSA.

1. **CAC 4-317(c)** – This section indicates that no school building shall be constructed, rehabilitated, reconstructed or relocated within 50 feet of the trace of an active fault.

DSA comment: DSA agrees that this section does not include “Alterations” to existing school buildings. In addition, the definitions of the types of work indicated above are as follows:

- *Constructed – New construction of a building*
- *Rehabilitated – Per the definition in CAC 4-314, rehabilitation is a seismic retrofit (i.e., mandatory) that complies with current code.*
- *Reconstructed – Repair of fire damage only.*
- *Relocated – Building to be relocated to site or within site, e.g., relocatable classroom.*

- 2. CAC 4-309(d)** – Per this section, alterations to existing structural components or additions of new structural components that do not exceed the limitations of Section 4-309(c)2 for required rehabilitation and are initiated for the purpose of increasing the strength or stiffness of the lateral force-resisting system of an existing structure are permitted to be evaluated and designed in accordance with California Existing Building Code Section 317.11 and CBC Section 1609A for voluntary lateral force-resisting system modifications.

DSA comment: A voluntary seismic retrofit is an “Alteration.” Other types of alterations are the installation of a new fire alarm system, HVAC replacement, ADA improvements, paint, etc.

- 3. CAC 4-309(c)1** – If a structure is located in a fault hazard zone, the costs of the voluntary lateral force-resisting modifications (Alterations) are to be included (contributing) towards the 50% replacement cost of the value of the existing building.

Arguably, according to the code, the entire building could potentially be left unaltered without structural retrofit if the cost of reconstruction, alteration, or addition, excluding the cost of voluntary seismic retrofit, does not exceed 50 percent of its replacement value. As noted previously, a voluntary seismic upgrade is permitted if it does not exceed the 50% threshold.

A voluntary seismic upgrade would require sufficient work and expense to trigger the mandatory seismic upgrade. If the mandatory upgrade is not triggered, designing a building to resist seismic surface rupture is not codified and would pose more challenges with DSA. One option could be installing a new mat foundation under the portions of the building within the “No Construction Zone” to allow the building to span over any anticipated surface rupture, hopefully creating a collapse prevention state in the building, which would likely not be salvageable after such an earthquake.

In our professional opinion, maintaining the building as it currently stands poses significant life-safety risks. We do not recommend upgrading it considering the "No Construction Zone," extreme financial costs, known difficulties in getting this option approved by DSA, and the uncertainty of achieving a collapse prevention state.

B. Option 2: Keep only the portion of the Administration Building not on the fault

It is structurally feasible to preserve the portion of the Administration Building that is not situated over the "No Construction Zone". This would necessitate the demolition of the majority of the structure in Section A and small portions of the structure in Section B. Additionally, this approach would require addressing all other compliance issues identified in the Tier 1 report that are not related to surface rupture. The existing stair in Section A could probably be saved with the addition of a new shear wall, as can the majority of Section B. This should also be evaluated based on overall school usage as well as architecturally to understand existing and ADA issues involved. If a portion of the existing building is to remain, it will need to be verified with DSA to determine if the cost of the replacement building will be based on the remaining square footage. In addition, the seismic weight of the building will need to be adjusted and based upon the remaining square footage.

Figure 5 shows a conceptual plan of structural work required to accomplish this option. The majority of section "A" and a small portion of section "B" shown in blue hatch need to be demolished.

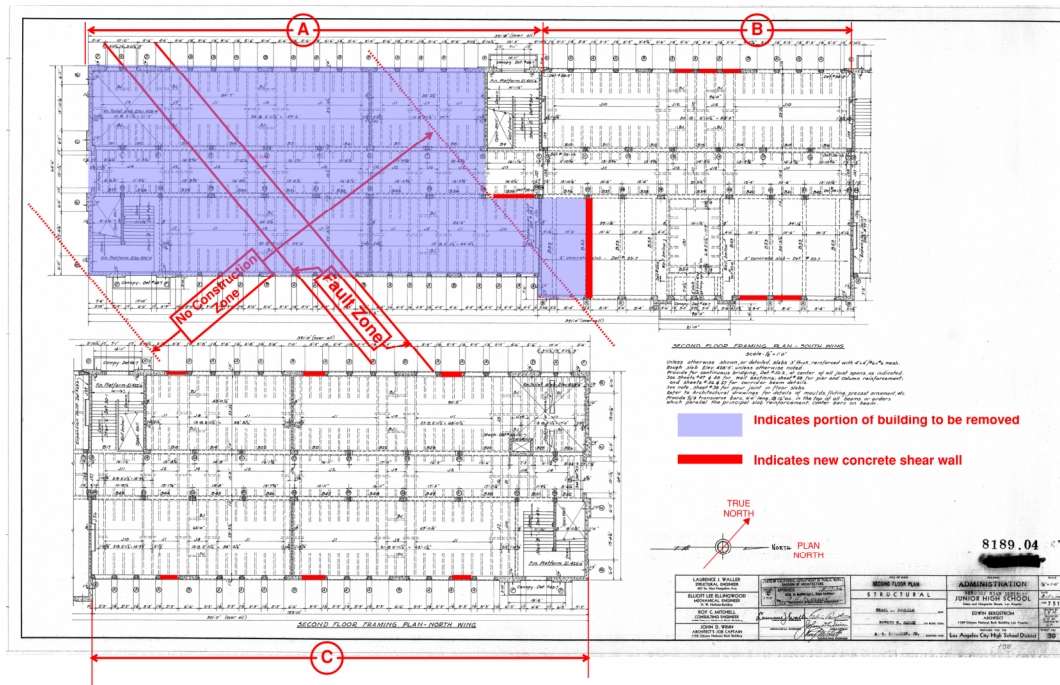

Figure 5. Conceptual plan showing keeping portion of structure not falling on No Construction Zone

For the remaining section “B,” there are only two east-west shear walls of substantial length and none of substantial length in the north-south direction. Since half of the E-W walls are to be demolished, it will be necessary to provide a 10” thick replacement wall E-W and two functional 12” thick walls N-S. If these walls can be roughly located as shown, there is a chance no other upgrade will be required structurally since the stiff buildings may eliminate the need to upgrade to address adjacency issues. These new shear walls would require new foundations and would have to be dowelled into the existing concrete floors and roof. If they cannot be dowelled in successfully, it is possible to provide significant horizontal shear transfer and vertical overturning resistance using fiber reinforced polymer technology (FRP). This same technology could be used to transfer additional axial drag/collector forces from floors to the walls.

Section “C” can be upgraded seismically by adding some N-S concrete shear walls shown in Figure 5. The existing E-W walls are likely adequate but could be strengthened using FRP if sufficient strength is not provided in their current condition. Additional shear walls appear needed in the north-south direction, perhaps filling in the current windows with 12” thick concrete walls as shown in Figure 5. These new shear walls would require new foundations and would have to be dowelled into the existing concrete floors and roof. The same FRP solution described for section “C” may be used.

Administration Building -Seismic Retrofit

LAUSD Irving Steam Magnet School

Rough Order of Magnitude

August 28, 2024

Project Description

The project is seismic retrofit of the Existing Admin Building at Irving Steam Magnet School Campus. It is a 2-story, 50,901 square feet and with floor to floor height of 15'.

Construction Cost	Seismic Retrofit			Replacement Cost			% of Replacement Value
	Area	\$ / SF	Total Cost	Area	\$ / SF	Total Cost	
	A			B			C = A/B
Admin Building - Seismic Retrofit & Related Scope				50,901 SF	\$845.62	\$43,042,904	
1. Located on a seismic fault - Provide New Mat Foundation	50,901 SF	\$195	\$9,927,829				23.06%
2. Perimeter concrete shear walls are overstressed - Strengthen (E) Shearwalls	50,901 SF	\$225	\$11,458,260				26.62%
3. Existing seismic joints are undersized - Stiffen building by adding or strengthening shear walls	50,901 SF	\$63	\$3,204,518				7.44%
4. Diaphragm openings at stairs are oversized	50,901 SF	\$9	\$453,600				1.05%
Total Construction Costs	50,901 SF	\$492	\$25,044,206	50,901 SF	\$846	\$43,042,904	58.18%

Note:

- Replacement cost is based on Cumming Projected Costs for 2024 Market
- Only Scopes affected by Retrofit are Included.
- No Interior Renovations and ADA Upgrades are Included
- No MEP systems and equipment upgrade are Included
- Cost Escalation - Excluded
- Construction Contingency - Excluded
- FF&E - Excluded
- Soft Costs - Excluded
