

## Algebra 2 – UNIT 4

### Geometry and Trigonometry

**Critical Area:** Students use algebraic manipulation, including completing the square, as a tool for geometric understanding to determine if the equation represents a circle or a parabola. They graph shapes and relate the graphs to the behavior of the functions with the transformation on the variable (e.g. the graph of  $y=f(x+2)$ ). Students expand on their understanding of the trigonometric functions first developed in Geometry to explore the graphs of trigonometric functions with attention to the connection between the unit circle representation of the trigonometric functions and their properties, use trigonometric functions to model periodic phenomena. Students use Pythagorean identity to find the trig function outputs given the angle and understand that interpretation of sine and cosine yield the Pythagorean Identity.

CLUSTERS	COMMON CORE STATE STANDARDS (*) Indicates a modeling standard linking mathematics to everyday life, work, and decision making.
<b>Translate between the geometric description and the equation for a conic section</b>	<b>Geometry – Expressing Geometry Properties with Equations</b> <b>G-GPE.3.1.</b> Given a quadratic equation of the form $ax^2 + by^2 + cx + dy + e = 0$ , use the method for completing the square to put the equation into standard form; identify whether the graph of the equation is a circle, ellipse, parabola, or hyperbola, and graph the equation. [In Algebra II, this standard addresses circles and parabolas only.] CA
<b>Extend the domain of the trigonometric functions using the unit circle</b>	<b>Functions – Trigonometric Functions</b> <b>F-TF.1.</b> Understand radian measure of an angle as the length of the arc on the unit circle subtended by the angle. <b>F-TF.2.</b> Explain how the unit circle in the coordinate plane enables the extension of trigonometric functions to all real numbers, interpreted as radian measures of angles traversed counterclockwise around the unit circle. <b>F-TF.2.1.</b> Graph all 6 basic trigonometric functions.
<b>Model periodic phenomena with trigonometric functions</b>	<b>F-TF.5.</b> Choose trigonometric functions to model periodic phenomena with specified amplitude, frequency, and midline. ★
<b>Prove and apply trigonometric identities</b>	<b>F-TF.8.</b> Prove the Pythagorean identity $\sin^2(\theta) + \cos^2(\theta) = 1$ and use it to find $\sin(\theta)$ , $\cos(\theta)$ , or $\tan(\theta)$ given $\sin(\theta)$ , $\cos(\theta)$ , or $\tan(\theta)$ and the quadrant.
<b>MATHEMATICAL PRACTICES</b>	
<ol style="list-style-type: none"> <li><b>1. Make sense of problems and persevere in solving them.</b></li> <li><b>2. Reason abstractly and quantitatively.</b></li> <li><b>3. Construct viable arguments and critique the reasoning of others.</b></li> </ol>	Emphasize all the mathematical practice standards as you address the standards in this unit. F-TF.5 would provide the opportunity to link mathematics to everyday life, work, and decision making.

<b>4. Model with mathematics.</b> <b>5. Use appropriate tools strategically.</b> <b>6. Attend to precision.</b> <b>7. Look for and make use of structure.</b> <b>8. Look for and express regularity in repeated reasoning.</b>	
<b>LEARNING PROGRESSIONS</b>	
High School Progression on Functions <a href="http://commoncoretools.me/wp-content/uploads/2013/07/ccss_progression_functions_2013_07_02.pdf">http://commoncoretools.me/wp-content/uploads/2013/07/ccss_progression_functions_2013_07_02.pdf</a>	

★Indicates a modeling standard linking mathematics to everyday life, work, and decision-making.

(+) Indicates additional mathematics to prepare students for advanced courses.

ENDURING UNDERSTANDINGS	ESSENTIAL QUESTIONS	KEY VOCABULARY
<ul style="list-style-type: none"> <li>A circle is a set of points that can be defined by an equation. This measurement is expressed in radians rather than degrees.</li> <li>Students extend the domain of trigonometric functions using the unit circle.</li> <li>Students establish a way to measure angles with respect to arc length.</li> <li>The trigonometric functions are extended to all real numbers to describe rotations around the unit circle.</li> <li>Our world is periodic. The amount of sunlight a city receives on a given day, high and low tides are all real life instances where sinusoids explain and model real life phenomena.</li> <li>Prove the Pythagorean identity <math>\sin^2(\theta) + \cos^2(\theta) = 1</math> and use it to find <math>\sin(\theta)</math>, <math>\cos(\theta)</math>, or <math>\tan(\theta)</math> given <math>\sin(\theta)</math>, <math>\cos(\theta)</math>, or <math>\tan(\theta)</math> and the quadrant of the angle.</li> <li>The Theorem of Pythagoras comes up in many places, including trigonometry, through the use of standard graphing form of a circle. It is used to prove many trigonometric identities.</li> </ul>	<ul style="list-style-type: none"> <li>How do you write the equation of a circle?</li> <li>What is the angle of rotation, and how is it measured?</li> <li>How can you explain the unit circle?</li> <li>Why do we need radian measure?</li> <li>Why are radians said to be unitless measures of angles?</li> <li>How can sine, cosine, and tangent functions be defined using the unit circle?</li> <li>What are periodic functions?</li> <li>Why is modeling them so important?</li> <li>Why is the Theorem of Pythagoras so essential?</li> </ul>	amplitude angle of rotation completing the square cosecant function cosine function cotangent function coterminal dilation domain initial side intercepted arc midline periodic function phase shift quadrants radian measure range reference angles secant function sine function sinusoid special right triangles standard form of a circle standard position tangent function

### DIFFERENTIATION

FRONT LOADING	ACCELERATION	INTERVENTION
<p>In the extension of the trigonometric functions to the unit circle, proficient students must use repeated reasoning (MP.8).</p> <p>Students will model real world situations with trigonometric functions (MP.4).</p> <p>Use of trigonometric vocabulary, such as (amplitude, frequency, period, midline, degree, and radian) aid in communicating precisely (MP.6).</p> <p><b>Pre-Teach Vocabulary</b></p> <ul style="list-style-type: none"> <li>• State the definitions, and have students repeat the definitions.</li> <li>• Provide students with correct and incorrect usage of the word</li> </ul> <ul style="list-style-type: none"> <li>• Equation of Circles 1: <a href="http://map.mathshell.org/materials/download.php?fileid=1202">http://map.mathshell.org/materials/download.php?fileid=1202</a></li> </ul>	<p>Students can investigate daylight hours model and many other trigonometric modeling situations such as simple predator-prey models, sound waves, and noise cancellation models.</p> <p>Engage students to use trigonometric functions to model periodic phenomena. Connected to standard F-BF.3 (families of functions), they begin to understand the relationship between the parameters appearing in the general cosine function <math>f(x)=A \cdot \cos(Bx-C)+D</math> (and sine function) and the graph and behavior of the function (e.g., amplitude, frequency, line of symmetry).</p>	<p>Reteach the trigonometry ratio and remind students how to use (SOHCAHTOAH) to remember the trigonometric ratios.</p> <p>Teach students how to graph all 6 basic trigonometric functions, namely: sine, cosine, tangent, cotangent, secant, and cosecant. They can use any graphing utility such as graphing calculator, apps, and graphing software to graph the families of functions.</p> <p>Have students analyze and explain the meaning of amplitude, frequency, period, and midline based on their graphs.</p>
